from us by any unbridgeable gulf and does not disown the creatures that derive from him or condemn them to be only the figments of an illusion. He is the Being, all are his becomings. He does not create out of a void, out of a Nihil or out of an unsubstantial matrix of dream. Out of himself he creates, in himself he becomes; all are in his being and all is of his being. This truth admits and exceeds the pantheistic seeing of things. Vasudeva is all, *vāsudevah sarvam*; but Vasudeva is all that appears in the cosmos because he is too all that does not appear in it, all that is never manifested. His being is in no way limited by his becoming; he is in no degree bound by this world of relations. Even in becoming all he is still a Transcendence; even in assuming finite forms he is always the Infinite. Nature, Prakriti, is in her essence his spiritual power, self-power, *ātmāśakti*; this spiritual self-power develops infinite primal qualities of becoming in the inwardness of things and turns them into an external surface of form and action. For in her essential, secret and divine order the spiritual truth of each and all comes first, a thing of her deep identities; their psychological truth of quality and nature is dependent on the spiritual for all in it that is authentic, it derives from the spirit; least in necessity, last in order the objective truth of form and action derives from inner quality of nature and depends on it for all these variable presentations of existence here in the external order. Or in other words, the objective fact is only an expression of a sum of soul factors and these go back always to a spiritual cause of their appearance.

This finite outward becoming is an expressive phenomenon of the divine Infinite. Nature is, secondarily, the lower Nature, a subordinate variable development of a few selective combinations out of the many possibilities of the Infinite. Evolved out of essential and psychological quality of being and becoming, *svabhāva*, these combinations of form and energy, action and movement exist for a quite limited relation and mutual experience in the cosmic oneness. And in this lower, outward and apparent order of things Nature as an expressive power of the Godhead is disfigured by the perversions of an obscure cosmic Ignorance and her divine significances lost in the materialised,

separative and egoistic mechanism of our mental and vital experience. But still here also all is from the supreme Godhead, a birth, a becoming, an evolution,³ a process of development through action of Nature out of the Transcendent. *Aham sarvasya prabhavo mattah sarvam pravartate*; “I am the birth of everything and from me all proceeds into development of action and movement.” Not only is this true of all that we call good or praise and recognise as divine, all that is luminous, sattvic, ethical, peace-giving, spiritually joy-giving, “understanding and knowledge and freedom from the bewilderment of the Ignorance, forgiveness and truth and self-government and calm of inner control, non-injuring and equality, contentment and austerity and giving.” It is true also of the oppositions that perplex the mortal mind and bring in ignorance and its bewilderment, “grief and pleasure, coming into being and destruction, fear and fearlessness, glory and ingloriousness” with all the rest of the interplay of light and darkness, all the myriad mixed threads that quiver so painfully and yet with a constant stimulation through the entanglement of our nervous mind and its ignorant subjectivities. All here in their separate diversities are subjective becomings of existences in the one great Becoming and they get their birth and being from Him who transcends them. The Transcendent knows and originates these things, but is not caught as in a web in that diversified knowledge and is not overcome by his creation. We must observe here the emphatic collocation of the three words from the verb *bhū*, to become, *bhavanti*, *bhāvāḥ*, *bhūtānām*. All existences are becomings of the Divine, *bhūtāni*; all subjective states and movements are his and their psychological becomings, *bhāvāḥ*. These even, our lesser subjective conditions and their apparent results no less than the highest spiritual states, are all becomings from the supreme Being,⁴ *bhavanti matta eva*. The Gita recognises and stresses the distinction between Being and becoming, but does

³ *prabhava*, *bhāva*, *pravṛtti*.

⁴ Cf. the Upanishad, *ātmā eva abhūt sarvāṇī bhūtāni*, the Self has become all existences, with this contained significance in the choice of the words, the Self-existent has become all these becomings.

not turn it into an opposition. For that would be to abrogate the universal oneness. The Godhead is one in his transcendence, one all-supporting Self of things, one in the unity of his cosmic nature. These three are one Godhead; all derives from him, all becomes from his being, all is eternal portion or temporal expression of the Eternal. In the Transcendence, in the Absolute, if we are to follow the Gita, we must look, not for a supreme negation of all things, but for the positive key of their mystery, the reconciling secret of their existence.

But there is another supreme reality of the Infinite that must also be recognised as an indispensable element of the liberating knowledge. This reality is that of the transcendent downlook as well as the close immanent presence of the divine government of the universe. The Supreme who becomes all creation, yet infinitely transcends it, is not a will-less cause aloof from his creation. He is not an involuntary originator who disowns all responsibility for these results of his universal Power or casts them upon an illusive consciousness entirely different from his own or leaves them to a mechanical Law or to a Demiurge or to a Manichean conflict of Principles. He is not an aloof and indifferent Witness who waits impassively for all to abolish itself or return to its unmoved original principle. He is the mighty lord of the worlds and peoples, *loka-maheśvara*, and governs all not only from within but from above, from his supreme transcendence. Cosmos cannot be governed by a Power that does not transcend cosmos. A divine government implies the free mastery of an omnipotent Ruler and not an automatic force or mechanical law of determinative becoming limited by the apparent nature of the cosmos. This is the theistic seeing of the universe, but it is no shrinking and gingerly theism afraid of the world's contradictions, but one which sees God as the omniscient and omnipotent, the sole original Being who manifests in himself all, whatever it may be, good and evil, pain and pleasure, light and darkness as stuff of his own existence and governs himself what in himself he has manifested. Unaffected by its oppositions, unbound by his creation, exceeding, yet intimately related to this Nature and closely one with her creatures, their

Spirit, Self, highest Soul, Lord, Lover, Friend, Refuge, he is ever leading them from within them and from above through the mortal appearances of ignorance and suffering and sin and evil, ever leading each through his nature and all through universal Nature towards a supreme light and bliss and immortality and transcendence. This is the fullness of the liberating knowledge. It is a knowledge of the Divine within us and in the world as at the same time a transcendent Infinite. An Absolute who has become all that is by his divine Nature, his effective power of Spirit, he governs all from his transcendence. He is intimately present within every creature and the cause, ruler, director of all cosmic happenings and yet is he far too great, mighty and infinite to be limited by his creation.

This character of the knowledge is emphasised in three separate verses of promise. "Whosoever knows me," says the Godhead, "as the unborn who is without origin, mighty lord of the worlds and peoples, lives unbewildered among mortals and is delivered from all sin and evil. . . . Whosoever knows in its right principles this my pervading lordship and this my Yoga (the divine Yoga, *aisvara yoga*, by which the Transcendent is one with all existences, even while more than them all, and dwells in them and contains them as becoming of his own Nature), unites himself to me by an untrembling Yoga. . . . The wise hold me for the birth of each and all, hold each and all as developing from me its action and movement, and so holding they love and adore me . . . and I give them the Yoga of the understanding by which they come to me and I destroy for them the darkness which is born of the ignorance." These results must arise inevitably from the very nature of the knowledge and from the very nature of the Yoga which converts that knowledge into spiritual growth and spiritual experience. For all the perplexity of man's mind and action, all the stumbling, insecurity and affliction of his mind, his will, his ethical turn, his emotional, sensational and vital urgings can be traced back to the groping and bewildered cognition and volition natural to his sense-obscured mortal mind in the body, *sammoha*. But when he sees the divine Origin of all things, when he looks steadily from the cosmic appearance to its transcendent

Reality and back from that Reality to the appearance, he is then delivered from this bewilderment of the mind, will, heart and senses, he walks enlightened and free, *asammūḍhah martyeṣu*. Assigning to everything its supernal and real and not any longer only its present and apparent value, he finds the hidden links and connections; he consciously directs all life and act to their high and true object and governs them by the light and power which comes to him from the Godhead within him. Thus he escapes from the wrong cognition, the wrong mental and volitional reaction, the wrong sensational reception and impulse which here originate sin and error and suffering, *sarva-pāpaib pramucyate*. For living thus in the transcendent and universal he sees his own and every other individuality in their greater values and is released from the falsehood and ignorance of his separative and egoistic will and knowledge. That is always the essence of the spiritual liberation.

The wisdom of the liberated man is not then, in the view of the Gita, a consciousness of abstracted and unrelated impersonality, a do-nothing quietude. For the mind and soul of the liberated man are firmly settled in a constant sense, an integral feeling of the pervasion of the world by the actuating and directing presence of the divine Master of the universe, *etāṁ vibhūtim mama yo vetti*. He is aware of his spirit's transcendence of the cosmic order, but he is aware also of his oneness with it by the divine Yoga, *yogāṁ ca mama*. And he sees each aspect of the transcendent, the cosmic and the individual existence in its right relation to the supreme Truth and puts all in their right place in the unity of the divine Yoga. He no longer sees each thing in its separateness,—the separate seeing that leaves all either unexplained or one-sided to the experiencing consciousness. Nor does he see all confusedly together,—the confused seeing that gives a wrong light and a chaotic action. Secure in the transcendence, he is not affected by the cosmic stress and the turmoil of Time and circumstance. Untroubled in the midst of all this creation and destruction of things, his spirit adheres to an unshaken and untrembling, an unvacillating Yoga of union with the eternal and spiritual in the universe. He watches through it all

the divine persistence of the Master of the Yoga and acts out of a tranquil universality and oneness with all things and creatures. And this close contact with all things implies no involution of soul and mind in the separative lower nature, because his basis of spiritual experience is not the inferior phenomenal form and movement but the inner All and the supreme Transcendence. He becomes of like nature and law of being with the Divine, *sādharmyam āgataḥ*, transcendent even in universality of spirit, universal even in the individuality of mind, life and body. By this Yoga once perfected, undeviating and fixed, *avikampena yogena yujyate*, he is able to take up whatever poise of nature, assume whatever human condition, do whatever world-action without any fall from his oneness with the divine Self, without any loss of his constant communion with the Master of existence.⁵

This knowledge translated into the affective, emotional, temperamental plane becomes a calm love and intense adoration of the original and transcendental Godhead above us, the ever-present Master of all things here, God in man, God in Nature. It is at first a wisdom of the intelligence, the *buddhi*; but that is accompanied by a moved spiritualised state of the affective nature,⁶ *bhāva*. This change of the heart and mind is the beginning of a total change of all the nature. A new inner birth and becoming prepares us for oneness with the supreme object of our love and adoration, *madbhāvāya*. There is an intense delight of love in the greatness and beauty and perfection of this divine Being now seen everywhere in the world and above it, *prīti*. That deeper ecstasy assumes the place of the scattered and external pleasure of the mind in existence or rather it draws all other delight into it and transforms by a marvellous alchemy the mind's and the heart's feelings and all sense movements. The whole consciousness becomes full of the Godhead and replete with his answering consciousness; the whole life flows into one sea of bliss-experience. All the speech and thought of such God-lovers becomes a mutual utterance and understanding of the

⁵ *sarvathā vartamāno'pi sa yogī mayi vartate.*

⁶ *budhā bhāva-samanvitāḥ*.

Divine. In that one joy is concentrated all the contentment of the being, all the play and pleasure of the nature. There is a continual union from moment to moment in the thought and memory, there is an unbroken continuity of the experience of oneness in the spirit. And from the moment that this inner state begins, even in the stage of imperfection, the Divine confirms it by the perfect Yoga of the will and intelligence. He uplifts the blazing lamp of knowledge within us, he destroys the ignorance of the separative mind and will, he stands revealed in the human spirit. By the Yoga of the will and intelligence founded on an illumined union of works and knowledge the transition was effected from our lower troubled mind-ranges to the immutable calm of the witnessing Soul above the active nature. But now by this greater yoga of the Buddhi founded on an illumined union of love and adoration with an all-comprehending knowledge the soul rises in a vast ecstasy to the whole transcendental truth of the absolute and all-originating Godhead. The Eternal is fulfilled in the individual spirit and individual nature; the individual spirit is exalted from birth in time to the infinitudes of the Eternal.

VIII

God in Power of Becoming

A VERY important step has been reached, a decisive statement of its metaphysical and psychological synthesis has been added to the development of the Gita's gospel of spiritual liberation and divine works. The Godhead has been revealed in thought to Arjuna; he has been made visible to the mind's search and the heart's seeing as the supreme and universal Being, the supernal and universal Person, the inward-dwelling Master of our existence for whom man's knowledge, will and adoration were seeking through the mists of the Ignorance. There remains only the vision of the multiple Virat Purusha to complete the revelation on one more of its many sides.

The metaphysical synthesis is complete. Sankhya has been admitted for the separation of the soul from the lower nature,—a separation that must be effected by self-knowledge through the discriminating reason and by transcendence of our subjection to the three gunas constituent of that nature. It has been completed and its limitations exceeded by a large revelation of the unity of the supreme Soul and supreme Nature, *para purusa*, *para prakrti*. Vedanta of the philosophers has been admitted for the self-effacement of the natural separative personality built round the ego. Its method has been used to replace the little personal by the large impersonal being, to annul the separative illusion in the unity of the Brahman and to substitute for the blind seeing of the ego the truer vision of all things in one Self and one Self in all things. Its truth has been completed by the impartial revelation of the Parabrahman from whom originate both the mobile and the immobile, the mutable and the immutable, the action and the silence. Its possible limitations have been transcended by the intimate revelation of the supreme Soul and Lord who becomes here in all Nature, manifests himself in all personality and puts forth the power of his Nature in all action. Yoga has

been admitted for the self-surrender of the will, mind, heart, all the psychological being to the Ishwara, the divine Lord of the nature. It has been completed by the revelation of the supernal Master of existence as the original Godhead of whom the Jiva is the partial being in Nature. Its possible limitations have been exceeded by the soul's seeing of all things as the Lord in the light of a perfect spiritual oneness.

There results an integral vision of the Divine Existent at once as the transcendent Reality, supracosmic origin of cosmos, as the impersonal Self of all things, calm continent of the cosmos, and as the immanent Divinity in all beings, personalities, objects, powers and qualities, the Immanent who is the constituent self, the effective nature and the inward and outward becoming of all existences. The Yoga of knowledge has been fulfilled sovereignly in this integral seeing and knowing of the One. The Yoga of works has been crowned by the surrender of all works to their Master,—for the natural man is now only an instrument of his will. The Yoga of love and adoration has been declared in its amplest forms. The intense consummation of knowledge and works, love conducts to a crowning union of soul and Oversoul in a highest amplitude. In that union the revelations of knowledge are made real to the heart as well as to the intelligence. In that union the difficult sacrifice of self in an instrumental action becomes the easy, free and blissful expression of a living oneness. The whole means of the spiritual liberation has been given; the whole foundation of the divine action has been constructed.

Arjuna accepts the entire knowledge that has thus been given to him by the divine Teacher. His mind is already delivered from its doubts and seekings; his heart, turned now from the outward aspect of the world, from its baffling appearance to its supreme sense and origin and its inner realities, is already released from sorrow and affliction and touched with the ineffable gladness of a divine revelation. The language which he is made to use in voicing his acceptance is such as to emphasise and insist once again on the profound integrality of this knowledge and its all-embracing finality and fullness. He accepts first the Avatar, the Godhead in man who is speaking to him as the supreme

Brahman, as the supracosmic All and Absolute of existence in which the soul can dwell when it rises out of this manifestation and this partial becoming to its source, *param brahma, param dhāma*. He accepts him as the supreme purity of the ever free Existence to which one arrives through the effacement of ego in the self's immutable impersonality calm and still for ever, *pavitram paramam*. He accepts him next as the one Permanent, the eternal Soul, the divine Purusha, *puruṣam sāśvatam̄ divyam*. He acclaims in him the original Godhead, adores the Unborn who is the pervading, indwelling, self-extending master of all existence, *ādi-devam ajam vibhum*. He accepts him therefore not only as that Wonderful who is beyond expression of any kind, for nothing is sufficient to manifest him,— “neither the Gods nor the Titans, O blessed Lord, know thy manifestation,” *na hi te bhagavan vyaktim̄ vidur devā na dānavāḥ*,— but as the lord of all existences and the one divine efficient cause of all their becoming, God of the gods from whom all godheads have sprung, master of the universe who manifests and governs it from above by the power of his supreme and his universal Nature, *bhūtabhāvana bhūtesa deva-deva jagat-pate*. And lastly he accepts him as that Vasudeva in and around us who is all things here by virtue of the world-pervading, all-inhabiting, all-constituting master powers of his becoming, *vibhūtayah*, “the sovereign powers of thy becoming by which thou standest pervading these worlds,” *yābbhir vibhūtibhir lokān imāṁs tvāṁ vyāpya tiṣṭhasi*.¹

He has accepted the truth with the adoration of his heart, the submission of his will and the understanding of his intelligence. He is already prepared to act as the divine instrument in this knowledge and with this self-surrender. But a desire for a deeper constant spiritual realisation has been awakened in his heart and will. This is a truth which is evident only to the supreme Soul in its own self-knowledge,— for, cries Arjuna, “thou alone, O Purushottama, knowest thyself by thyself,” *ātmanā ātmānam̄ vettha*. This is a knowledge that comes by spiritual identity and the unaided heart, will, intelligence of the natural man cannot

¹ Gita, X. 12-15.

arrive at it by their own motion and can only get at imperfect mental reflections that reveal less than they conceal and disfigure. This is a secret wisdom which one must hear from the seers who have seen the face of this Truth, have heard its word and have become one with it in self and spirit. "All the Rishis say this of thee and the divine seer Narada, Asita, Devala, Vyasa." Or else one must receive it from within by revelation and inspiration from the inner Godhead who lifts in us the blazing lamp of knowledge. *Svayañcaiva braviṣi me*, "and thou thyself sayest it to me." Once revealed, it has to be accepted by the assent of the mind, the consent of the will and the heart's delight and submission, the three elements of the complete mental faith, *śraddhā*. It is so that Arjuna has accepted it; "all this that thou sayest, my mind holds for the truth." But still there will remain the need of that deeper possession in the very self of our being out from its most intimate psychic centre, the soul's demand for that inexpressible permanent spiritual realisation of which the mental is only a preliminary or a shadow and without which there cannot be a complete union with the Eternal.

Now the way to arrive at that realisation has been given to Arjuna. And so far as regards the great self-evident divine principles, these do not baffle the mind; it can open to the idea of the supreme Godhead, to the experience of the immutable Self, to the direct perception of the immanent Divinity, to the contact of the conscient universal Being. One can, once the mind is illumined with the idea, follow readily the way and, with whatever preliminary difficult effort to exceed the normal mental perceptions, come in the end to the self-experience of these essential truths that stand behind our and all existence, *ātmanā ātmānam*. One can do it with this readiness because these, once conceived, are evidently divine realities; there is nothing in our mental associations to prevent us from admitting God in these high aspects. But the difficulty is to see him in the apparent truths of existence, to detect him in this fact of Nature and in these disguising phenomena of the world's becoming; for here all is opposed to the sublimity of this unifying conception. How can we consent to see the Divine as man and animal being and

inanimate object, in the noble and the low, the sweet and the terrible, the good and the evil? If, assenting to some idea of God extended in the things of the cosmos, we see him in ideal light of knowledge and greatness of power and charm of beauty and beneficence of love and ample largeness of spirit, how shall we avoid the breaking of the unity by their opposites which in actual fact cling to these high things and envelop them and obscure? And if in spite of the limitations of human mind and nature we can see God in the man of God, how shall we see him in those who oppose him and represent in act and nature all that we conceive of as undivine? If Narayana is without difficulty visible in the sage and the saint, how shall he be easily visible to us in the sinner, the criminal, the harlot and the outcaste? To all the differentiations of the world-existence the sage, looking everywhere for the supreme purity and oneness, returns the austere cry, "not this, not this," *neti neti*. Even if to many things in the world we give a willing or reluctant assent and admit the Divine in the universe, still before most must not the mind persist in that cry "not this, not this"? Here constantly the assent of the understanding, the consent of the will and the heart's faith become difficult to a human mentality anchored always on phenomenon and appearance. At least some compelling indications are needed, some links and bridges, some supports to the difficult effort at oneness.

Arjuna, though he accepts the revelation of Vasudeva as all and though his heart is full of the delight of it, — for already he finds that it is delivering him from the perplexity and stumbling differentiations of his mind which was crying for a clue, a guiding truth amid the bewildering problems of a world of oppositions, and it is to his hearing the nectar of immortality, *amṛtam*, — yet feels the need of such supports and indices. He feels that they are indispensable to overcome the difficulty of a complete and firm realisation; for how else can this knowledge be made a thing of the heart and life? He requires guiding indications, asks Krishna even for a complete and detailed enumeration of the sovereign powers of his becoming and desires that nothing shall be left out of the vision, nothing remain to baffle him. "Thou

shouldst tell me" he says "of thy divine self-manifestations in thy sovereign power of becoming, *divyā ātma-vibhūtayah*, all without exception,—*āśeṣena*, nothing omitted,—thy Vibhutis by which thou pervadest these worlds and peoples. How shall I know thee, O Yogin, by thinking of thee everywhere at all moments and in what pre-eminent becomings should I think of thee?" This Yoga by which thou art one with all and one in all and all are becomings of thy being, all are pervading or pre-eminent or disguised powers of thy nature, tell me of it, he cries, in its detail and extent, and tell me ever more of it; it is nectar of immortality to me, and however much of it I hear, I am not satiated. Here we get an indication in the Gita of something which the Gita itself does not bring out expressly, but which occurs frequently in the Upanishads and was developed later on by Vaishnavism and Shaktism in a greater intensity of vision, man's possible joy of the Divine in the world-existence, the universal Ananda, the play of the Mother, the sweetness and beauty of God's Lila.²

The divine Teacher accedes to the request of the disciple, but with an initial reminder that a full reply is not possible. For God is infinite and his manifestation is infinite. The forms of his manifestation too are innumerable. Each form is a symbol of some divine power, *vibhūti*, concealed in it and to the seeing eye each finite carries in it its own revelation of the infinite. Yes, he says, I will tell thee of my divine Vibhutis, but only in some of my principal pre-eminences and as an indication and by the example of things in which thou canst most readily see the power of the Godhead, *prādhānyataḥ, uddeśataḥ*. For there is no end to the innumerable detail of the Godhead's self-extension in the universe, *nāsti anto vistarasya me*. This reminder begins the passage and is repeated at the end in order to give it a greater and unmistakable emphasis. And then throughout the rest of the chapter³ we get a summary description of these principal indications, these pre-eminent signs of the divine force present in the things and persons of the universe. It seems at first as

² X. 16-18. ³ X. 19-42.

if they were given pell-mell, without any order, but still there is a certain principle in the enumeration, which, if it is once disengaged, can lead by a helpful guidance to the inner sense of the idea and its consequences. The chapter has been called the Vibhuti-Yoga, — an indispensable yoga. For while we must identify ourselves impartially with the universal divine Becoming in all its extension, its good and evil, perfection and imperfection, light and darkness, we must at the same time realise that there is an ascending evolutionary power in it, an increasing intensity of its revelation in things, a hierarchic secret something that carries us upward from the first concealing appearances through higher and higher forms towards the large ideal nature of the universal Godhead.

This summary enumeration begins with a statement of the primal principle that underlies all the power of this manifestation in the universe. It is this that in every being and object God dwells concealed and discoverable; he is housed as in a crypt in the mind and heart of every thing and creature, an inner self in the core of its subjective and its objective becoming, one who is the beginning and middle and end of all that is, has been or will be. For it is this inner divine Self hidden from the mind and heart which he inhabits, this luminous Inhabitant concealed from the view of the soul in Nature which he has put forth into Nature as his representative, who is all the time evolving the mutations of our personality in Time and our sensational existence in Space, — Time and Space that are the conceptual movement and extension of the Godhead in us. All is this self-seeing Soul, this self-representing Spirit. For ever from within all beings, from within all conscient and inconscient existences, this All-conscient develops his manifested self in quality and power, develops it in the forms of objects, in the instruments of our subjectivity, in knowledge and word and thinking, in the creations of the mind and in the passion and actions of the doer, in the measures of Time, in cosmic powers and godheads and in the forces of Nature, in plant life, in animal life, in human and superhuman beings.

If we look at things with this eye of vision unblinded by

differentiations of quality and quantity or by difference of values and oppositions of nature, we shall see that all things are in fact and can be nothing but powers of his manifestation, vibhutis of this universal Soul and Spirit, Yoga of this great Yогин, self-creations of this marvellous self-Creator. He is the unborn and the all-pervading Master of his own innumerable becomings in the universe, *ajo vibhuḥ*; all things are his powers and effectuations in his self-Nature, vibhutis. He is the origin of all they are, their beginning; he is their support in their ever-changing status, their middle; he is their end too, the culmination or the disintegration of each created thing in its cessation or its disappearance. He brings them out from his consciousness and is hidden in them, he withdraws them into his consciousness and they are hidden in him for a time or for ever. What is apparent to us is only a power of becoming of the One: what disappears from our sense and vision is effect of that power of becoming of the One. All classes, genera, species, individuals are such vibhutis. But since it is through power in his becoming that he is apparent to us, he is especially apparent in whatever is of a pre-eminent value or seems to act with a powerful and pre-eminent force. And therefore in each kind of being we can see him most in those in whom the power of nature of that kind reaches its highest, its leading, its most effectively self-revealing manifestation. These are in a special sense Vibhutis. Yet the highest power and manifestation is only a very partial revelation of the Infinite; even the whole universe is informed by only one degree of his greatness, illumined by one ray of his splendour, glorious with a faint hint of his delight and beauty. This is in sum the gist of the enumeration, the result we carry away from it, the heart of its meaning.

God is imperishable, beginningless, unending Time; this is his most evident Power of becoming and the essence of the whole universal movement. *Aham eva akṣayah kālah*. In that movement of Time and Becoming God appears to our conception or experience of him by the evidence of his works as the divine Power who ordains and sets all things in their place in the movement. In his form of Space it is he who fronts us

in every direction, million-bodied, myriad-minded, manifest in each existence; we see his faces on all sides of us. *Dhātā 'ham viśvato-mukhaḥ*. For simultaneously in all these many million persons and things, *sarva-bhūteṣu*, there works the mystery of his self and thought and force and his divine genius of creation and his marvellous art of formation and his impeccable ordering of relations and possibilities and inevitable consequences. He appears to us too in the universe as the universal spirit of Destruction, who seems to create only to undo his creations in the end,—“I am all-snatching Death,” *aham mr̥tyuḥ sarva-harab*. And yet his Power of becoming does not cease from its workings, for the force of rebirth and new creation ever keeps pace with the force of death and destruction,—“and I am too the birth of all that shall come into being.” The divine Self in things is the sustaining Spirit of the present, the withdrawing Spirit of the past, the creative Spirit of the future.

Then among all these living beings, cosmic godheads, super-human and human and subhuman creatures, and amid all these qualities, powers and objects, the chief, the head, the greatest in quality of each class is a special power of the becoming of the Godhead. I am, says the Godhead, Vishnu among the Adityas, Shiva among the Rudras, Indra among the gods, Prahlada among the Titans, Brihaspati the chief of the high priests of the world, Skanda the war-god, leader of the leaders of battle, Marichi among the Maruts, the lord of wealth among the Yakshas and Rakshasas, the serpent Ananta among the Nagas, Agni among the Vasus, Chitraratha among the Gandharvas, Kandarpa the love-God among the progenitors, Varuna among the peoples of the sea, Aryaman among the Fathers, Narada among the divine sages, Yama lord of the Law among those who maintain rule and law, among the powers of storm the Wind-God. At the other end of the scale I am the radiant sun among lights and splendours, the moon among the stars of night, the ocean among the flowing waters, Meru among the peaks of the world, Himalaya among the mountain-ranges, Ganges among the rivers, the divine thunderbolt among weapons. Among all plants and trees I am the Aswattha, among horses Indra’s horse Uchchaihsravas, Airavata

among the elephants, among the birds Garuda, Vasuki the snake-god among the serpents, Kamadhuk the cow of plenty among cattle, the alligator among fishes, the lion among the beasts of the forest. I am Margasirsha, first of the months; I am spring, the fairest of the seasons.

In living beings, the Godhead tells Arjuna, I am consciousness by which they are aware of themselves and their surroundings. I am mind among the senses, mind by which they receive the impressions of objects and react upon them. I am man's qualities of mind and character and body and action; I am glory and speech and memory and intelligence and steadfastness and forgiveness, the energy of the energetic and the strength of the mighty. I am resolution and perseverance and victory, I am the sattvic quality of the good, I am the gambling of the cunning; I am the mastery and power of all who rule and tame and vanquish and the policy of all who succeed and conquer; I am the silence of things secret, the knowledge of the knower, the logic of those who debate. I am the letter A among letters, the dual among compounds, the sacred syllable OM among words, the Gayatri among metres, the Sama-veda among the Vedas and the great Sama among the mantras. I am Time the head of all reckoning to those who reckon and measure. I am spiritual knowledge among the many philosophies, arts and sciences. I am all the powers of the human being and all the energies of the universe and its creatures.

Those in whom my powers rise to the utmost heights of human attainment are myself always, my special Vibhutis. I am among men the king of men, the leader, the mighty man, the hero. I am Rama among warriors, Krishna among the Vrishnis, Arjuna among the Pandavas. The illumined Rishi is my Vibhuti; I am Bhrigu among the great Rishis. The great seer, the inspired poet who sees and reveals the truth by the light of the idea and sound of the word, is myself luminous in the mortal; I am Ushanas among the seer-poets. The great sage, thinker, philosopher is my power among men, my own vast intelligence; I am Vyasa among the sages. But, with whatever variety of degree in manifestation, all beings are in their own way and nature

powers of the Godhead; nothing moving or unmoving, animate or inanimate in the world can be without me. I am the divine seed of all existences and of that seed they are the branches and flowers; what is in the seed of self, that only they can develop in Nature. There is no numbering or limit to my divine Vibhutis; what I have spoken is nothing more than a summary development and I have given only the light of a few leading indications and a strong opening to endless verities. Whatever beautiful and glorious creature thou seest in the world, whatever being is mighty and forceful among men and above man and below him, know to be a very splendour, light and energy of Me and born of a potent portion and intense power of my existence. But what need is there of a multitude of details for this knowledge? Take it thus, that I am here in this world and everywhere, I am in all and I constitute all: there is nothing else than I, nothing without Me. I support this entire universe with a single degree of my illimitable power and an infinitesimal portion of my fathomless spirit; all these worlds are only sparks, hints, glintings of the I Am eternal and immeasurable.

IX

The Theory of the Vibhuti

THE IMPORTANCE of this chapter of the Gita is very much greater than appears at first view or to an eye of prepossession which is looking into the text only for the creed of the last transcendence and the detached turning of the human soul away from the world to a distant Absolute. The message of the Gita is the gospel of the Divinity in man who by force of an increasing union unfolds himself out of the veil of the lower Nature, reveals to the human soul his cosmic spirit, reveals his absolute transcendencies, reveals himself in man and in all beings. The potential outcome here of this union, this divine Yoga, man growing towards the Godhead, the Godhead manifest in the human soul and to the inner human vision, is our liberation from limited ego and our elevation to the higher nature of a divine humanity. For dwelling in this greater spiritual nature and not in the mortal weft, the tangled complexity of the three gunas, man, one with God by knowledge, love and will and the giving up of his whole being into the Godhead, is able indeed to rise to the absolute Transcendence, but also to act upon the world, no longer in ignorance, but in the right relation of the individual to the Supreme, in the truth of the Spirit, fulfilled in immortality, for God in the world and no longer for the ego. To call Arjuna to this action, to make him aware of the being and power that he is and of the Being and Power whose will acts through him, is the purpose of the embodied Godhead. To this end the divine Krishna is his charioteer; to this end there came upon him that great discouragement and deep dissatisfaction with the lesser human motives of his work; to substitute for them the larger spiritual motive this revelation is given to him in the supreme moment of the work to which he has been appointed. The vision of the World-Purusha and the divine command to action is the culminating point to which he was being led. That

is already imminent; but without the knowledge now given to him through the Vibhuti-Yoga it would not bring with it its full meaning.

The mystery of the world-existence is in part revealed by the Gita. In part, for who shall exhaust its infinite depths or what creed or philosophy say that it has enlightened in a narrow space or shut up in a brief system all the significance of the cosmic miracle? But so far as is essential for the Gita's purpose, it is revealed to us. We have the way of the origination of the world from God, the immanence of the Divine in it and its immanence in the Divine, the essential unity of all existence, the relation of the human soul obscured in Nature to the Godhead, its awakening to self-knowledge, its birth into a greater consciousness, its ascension into its own spiritual heights. But when this new self-vision and consciousness have been acquired in place of the original ignorance, what will be the liberated man's view of the world around him, his attitude towards the cosmic manifestation of which he has now the central secret? He will have first the knowledge of the unity of existence and the regarding eye of that knowledge. He will see all around him as souls and forms and powers of the one divine Being. Henceforward that vision will be the starting-point of all the inward and outward operations of his consciousness; it will be the fundamental seeing, the spiritual basis of all his actions. He will see all things and every creature living, moving and acting in the One, contained in the divine and eternal Existence. But he will also see that One as the Inhabitant in all, their Self, the essential Spirit within them without whose secret presence in their conscious nature they could not at all live, move or act and without whose will, power, sanction or sufferance not one of their movements at any moment would be in the least degree possible. Themselves too, their soul, mind, life and physical mould he will see only as a result of the power, will and force of this one Self and Spirit. All will be to him a becoming of this one universal Being. Their consciousness he will see to be derived entirely from its consciousness, their power and will to be drawn from and dependent on its power and will, their partial phenomenon of nature to be a resultant from its greater

divine Nature, whether in the immediate actuality of things it strikes the mind as a manifestation or a disguise, a figure or a disfigurement of the Godhead. No untoward or bewildering appearance of things will in any smallest degree diminish or conflict with the completeness of this vision. It is the essential foundation of the greater consciousness into which he has arisen, it is the indispensable light that has opened around him and the one perfect way of seeing, the one Truth that makes all others possible.

But the world is only a partial manifestation of the Godhead, it is not itself that Divinity. The Godhead is infinitely greater than any natural manifestation can be. By his very infinity, by its absolute freedom he exists beyond all possibility of integral formulation in any scheme of worlds or extension of cosmic Nature, however wide, complex, endlessly varied this and every world may seem to us,—*nāsti anto vistarasya me*,—however to our finite view infinite. Therefore beyond cosmos the eye of the liberated spirit will see the utter Divine. Cosmos he will see as a figure drawn from the Divinity who is beyond all figure, a constant minor term in the absolute existence. Every relative and finite he will see as a figure of the divine Absolute and Infinite, and both beyond all finites and through each finite he will arrive at that alone, see always that beyond each phenomenon and natural creature and relative action and every quality and every happening; looking at each of these things and beyond it, he will find in the Divinity its spiritual significance.

These things will not be to his mind intellectual concepts or this attitude to the world simply a way of thinking or a pragmatic dogma. For if his knowledge is conceptual only, it is a philosophy, an intellectual construction, not a spiritual knowledge and vision, not a spiritual state of consciousness. The spiritual seeing of God and world is not ideative only, not even mainly or primarily ideative. It is direct experience and as real, vivid, near, constant, effective, intimate as to the mind its sensuous seeing and feeling of images, objects and persons. It is only the physical mind that thinks of God and spirit as an abstract conception which it cannot visualise or represent

to itself except by words and names and symbolic images and fictions. Spirit sees spirit, the divinised consciousness sees God as directly and more directly, as intimately and more intimately than bodily consciousness sees matter. It sees, feels, thinks, senses the Divine. For to the spiritual consciousness all manifest existence appears as a world of spirit and not a world of matter, not a world of life, not a world even of mind; these other things are to its view only God-thought, God-force, God-form. That is what the Gita means by living and acting in Vasudeva, *mayi vartate*. The spiritual consciousness is aware of the Godhead with that close knowledge by identity which is so much more tremendously real than any mental perception of the thinkable or any sensuous experience of the sensible. It is so aware even of the Absolute who is behind and beyond all world-existence and who originates and surpasses it and is for ever outside its vicissitudes. And of the immutable self of this Godhead that pervades and supports the world's mutations with his unchanging eternity, this consciousness is similarly aware, by identity, by the oneness of this self with our own timeless unchanging immortal spirit. It is aware again in the same manner of the divine Person who knows himself in all these things and persons and becomes all things and persons in his consciousness and shapes their thoughts and forms and governs their actions by his immanent will. It is intimately conscious of God absolute, God as self, God as spirit, soul and nature. Even this external Nature it knows by identity and self-experience, but an identity freely admitting variation, admitting relations, admitting greater and lesser degrees of the action of the one power of existence. For Nature is God's power of various self-becoming, *ātma-vibhūti*.

But this spiritual consciousness of world-existence will not see Nature in the world as the normal mind of man sees it in the ignorance or only as it is in the effects of the ignorance. All in this Nature that is of the ignorance, all that is imperfect or painful or perverse and repellent, does not exist as an absolute opposite of the nature of the Godhead, but goes back to something behind itself, goes back to a saving power of spirit in which it can find its own true being and redemption. There is an

original and originating Supreme Prakriti, in which the divine power and will to be enjoys its own absolute quality and pure revelation. There is found the highest, there the perfect energy of all the energies we see in the universe. That is what presents itself to us as the ideal nature of the Godhead, a nature of absolute knowledge, absolute power and will, absolute love and delight. And all the infinite variations of its quality and energy, *ananta-guṇa, aganana-śakti*, are there wonderfully various, admirably and spontaneously harmonised free self-formulations of this absolute wisdom and will and power and delight and love. All is there a many-sided untrammelled unity of infinites. Each energy, each quality is in the ideal divine nature pure, perfect, self-possessed, harmonious in its action; nothing there strives for its own separate limited self-fulfilment, all act in an inexpressible oneness. There all dharmas, all laws of being—dharma, law of being, is only characteristic action of divine energy and quality, *guṇa-karma*,—are one free and plastic dharma. The one divine Power of being¹ works with an immeasurable liberty and, tied to no single excluding law, not limited by any binding system, rejoices in her own play of infinity and never falters in her truth of self-expression perfect for ever.

But in the universe in which we live, there is a separating principle of selection and differentiation. There we see each energy, each quality which comes out for expression labouring as if for its own hand, trying to get as much self-expression as it can in whatever way it can, and accommodating somehow as best or as worst it may that effort with the concomitant or rival effort of other energies and qualities for their separate self-expression. The Spirit, the Divine dwells in this struggling world-nature and imposes on it a certain harmony by the inalienable law of the inner secret oneness on which the action of all these powers is based. But it is a relative harmony which seems to result from an original division, to emerge from and subsist by the shock of divisions and not from an original oneness. Or at least the oneness seems to be suppressed and latent, not to

¹ *tapas, cit-śakti.*

find itself, never to put off its baffling disguises. And in fact it does not find itself till the individual being in this world-nature discovers in himself the higher divine Prakriti from whom this lesser movement is a derivation. Nevertheless, the qualities and energies at work in the world, operating variously in man, animal, plant, inanimate thing, are, whatever forms they may take, always divine qualities and energies. All energies and qualities are powers of the Godhead. Each comes from the divine Prakriti there, works for its self-expression in the lower Prakriti here, increases its potency of affirmation and actualised values under these hampering conditions, and as it reaches its heights of self-power, comes near to the visible expression of the Divinity and directs itself upward to its own absolute in the supreme, the ideal, the divine Nature. For each energy is being and power of the Godhead and the expansion and self-expression of energy is always the expansion and expression of the Godhead.

One might even say that at a certain point of intensity each force in us, force of knowledge, force of will, force of love, force of delight, can result in an explosion which breaks the shell of the lower formulation and liberates the energy from its separative action into union with the infinite freedom and power of the divine Being. A highest Godward tension liberates the mind through an absolute seeing of knowledge, liberates the heart through an absolute love and delight, liberates the whole existence through an absolute concentration of will towards a greater existence. But the percussion and the delivering shock come by the touch of the Divine on our actual nature which directs the energy away from its normal limited separative action and objects towards the Eternal, Universal and Transcendent, orientates it towards the infinite and absolute Godhead. This truth of the dynamic omnipresence of the divine Power of being is the foundation of the theory of the Vibhuti.

The infinite divine Shakti is present everywhere and secretly supports the lower formulation, *parā prakrtir me yayā dhāryate jagat*, but it holds itself back, hidden in the heart of each natural existence, *sarvabhūtānām hrddese*, until the veil of Yogamaya is rent by the light of knowledge. The spiritual being of man, the

Jiva, possesses the divine Nature. He is a manifestation of God in that Nature, *parā prakrtir jīva-bhūtā*, and he has latent in him all the divine energies and qualities, the light, the force, the power of being of the Godhead. But in this inferior Prakriti in which we live, the Jiva follows the principle of selection and finite determination, and there whatever nexus of energy, whatever quality or spiritual principle he brings into birth with him or brings forward as the seed of his self-expression, becomes an operative portion of his swabhava, his law of self-becoming, and determines his swadharma, his law of action. And if that were all, there would be no perplexity or difficulty; the life of man would be a luminous unfolding of godhead. But this lower energy of our world is a nature of ignorance, of egoism, of the three gunas. Because this is a nature of egoism, the Jiva conceives of himself as the separative ego: he works out his self-expression egoistically as a separative will to be in conflict as well as in association with the same will to be in others. He attempts to possess the world by strife and not by unity and harmony; he stresses an ego-centric discord. Because this is a nature of ignorance, a blind seeing and an imperfect or partial self-expression, he does not know himself, does not know his law of being, but follows it instinctively under the ill-understood compulsion of the world-energy, with a struggle, with much inner conflict, with a very large possibility of deviation. Because this is a nature of the three gunas, this confused and striving self-expression takes various forms of incapacity, perversion or partial self-finding. Dominated by the guna of tamas, the mode of darkness and inertia, the power of being works in a weak confusion, a prevailing incapacity, an unaspiring subjection to the blind mechanism of the forces of the Ignorance. Dominated by the guna of rajas, the mode of action, desire and possession, there is a struggle, there is an effort, there is a growth of power and capacity, but it is stumbling, painful, vehement, misled by wrong notions, methods and ideals, impelled to a misuse, corruption and perversion of right notions, methods or ideals and prone, especially, to a great, often an enormous exaggeration of the ego. Dominated by the guna of sattwa, the mode of light

and poise and peace, there is a more harmonious action, a right dealing with the nature, but right only within the limits of an individual light and a capacity unable to exceed the better forms of this lower mental will and knowledge. To escape from this tangle, to rise beyond the ignorance, the ego and the gunas is the first real step towards divine perfection. By that transcendence the Jiva finds his own divine nature and his true existence.

The liberated eye of knowledge in the spiritual consciousness does not in its outlook on the world see this struggling lower Nature alone. If we perceive only the apparent outward fact of our nature and others' nature, we are looking with the eye of the ignorance and cannot know God equally in all, in the sattvic, the rajasic, the tamasic creature, in God and Titan, in saint and sinner, in the wise man and the ignorant, in the great and in the little, in man, animal, plant and inanimate existence. The liberated vision sees three things at once as the whole occult truth of the natural being. First and foremost it sees the divine Prakriti in all, secret, present, waiting for evolution; it sees her as the real power in all things, that which gives its value to all this apparent action of diverse quality and force, and it reads the significance of these latter phenomena not in their own language of ego and ignorance, but in the light of the divine Nature. Therefore it sees too, secondly, the differences of the apparent action in Deva and Rakshasa, man and beast and bird and reptile, good and wicked, ignorant and learned, but as action of divine quality and energy under these conditions, under these masks. It is not deluded by the mask, but detects behind every mask the Godhead. It observes the perversion or the imperfection, but it pierces to the truth of the spirit behind, it discovers it even in the perversion and imperfection self-blinded, struggling to find itself, groping through various forms of self-expression and experience towards complete self-knowledge, towards its own infinite and absolute. The liberated eye does not lay undue stress on the perversion and imperfection, but is able to see all with a complete love and charity in the heart, a complete understanding in the intelligence, a complete equality in the spirit. Finally, it sees the upward urge of the striving powers of the Will to be

towards Godhead; it respects, welcomes, encourages all high manifestations of energy and quality, the flaming tongues of the Divinity, the mounting greatnesses of soul and mind and life in their intensities uplifted from the levels of the lower nature towards heights of luminous wisdom and knowledge, mighty power, strength, capacity, courage, heroism, benignant sweetness and ardour and grandeur of love and self-giving, pre-eminent virtue, noble action, captivating beauty and harmony, fine and godlike creation. The eye of the spirit sees and marks out the rising godhead of man in the great Vibhuti.

This is a recognition of the Godhead as Power, but power in its widest sense, power not only of might, but of knowledge, will, love, work, purity, sweetness, beauty. The Divine is being, consciousness and delight, and in the world all throws itself out and finds itself again by energy of being, energy of consciousness and energy of delight; this is a world of the works of the divine Shakti. That Shakti shapes herself here in innumerable kinds of beings and each of them has its own characteristic powers of her force. Each power is the Divine himself in that form, in the lion as in the hind, in the Titan as in the God, in the inconscient sun that flames through ether as in man who thinks upon earth. The deformation given by the gunas is the minor, not really the major aspect; the essential thing is the divine power that is finding self-expression. It is the Godhead who manifests himself in the great thinker, the hero, the leader of men, the great teacher, sage, prophet, religious founder, saint, lover of man, the great poet, the great artist, the great scientist, the ascetic self-tamer, the tamer of things and events and forces. The work itself, the high poem, the perfect form of beauty, the deep love, the noble act, the divine achievement is a movement of godhead; it is the Divine in manifestation.

This is a truth which all ancient cultures recognised and respected, but one side of the modern mind has singular repugnances to the idea, sees in it a worship of mere strength and power, an ignorant or self-degrading hero-worship or a doctrine of the Asuric superman. Certainly, there is an ignorant way of taking this truth, as there is an ignorant way of taking all

truths; but it has its proper place, its indispensable function in the divine economy of Nature. The Gita puts it in that right place and perspective. It must be based on the recognition of the divine self in all men and all creatures; it must be consistent with an equal heart to the great and the small, the eminent and the obscure manifestation. God must be seen and loved in the ignorant, the humble, the weak, the vile, the outcaste. In the Vibhuti himself it is not, except as a symbol, the outward individual that is to be thus recognised and set high, but the one Godhead who displays himself in the power. But this does not abrogate the fact that there is an ascending scale in manifestation and that Nature mounts upward in her degrees of self-expression from her groping, dark or suppressed symbols to the first visible expressions of the Godhead. Each great being, each great achievement is a sign of her power of self-exceeding and a promise of the final, the supreme exceeding. Man himself is a superior degree of natural manifestation to the beast and reptile, though in both there is the one equal Brahman. But man has not reached his own highest heights of self-exceeding and meanwhile every hint of a greater power of the Will to be in him must be recognised as a promise and an indication. Respect for the divinity in man, in all men, is not diminished, but heightened and given a richer significance by lifting our eyes to the trail of the great Pioneers who lead or point him by whatever step of attainment towards supermanhood.

Arjuna himself is a Vibhuti; he is a man high in the spiritual evolution, a figure marked out in the crowd of his contemporaries, a chosen instrument of the divine Narayana, the Godhead in humanity. In one place the Teacher speaking as the supreme and equal Self of all declares that there is none dear to him, none hated, but in others he says that Arjuna is dear to him and his bhakta and therefore guided and safe in his hands, chosen for the vision and the knowledge. There is here only an apparent inconsistency. The Power as the self of the cosmos is equal to all, therefore to each being he gives according to the workings of his nature; but there is also a personal relation of the Purushottama to the human being in which he is especially near to the man

who has come near to him. All these heroes and men of might who have joined in battle on the plain of Kurukshetra are vessels of the divine Will and through each he works according to his nature but behind the veil of his ego. Arjuna has reached that point when the veil can be rent and the embodied Godhead can reveal the mystery of his workings to his Vibhuti. It is even essential that there should be the revelation. He is the instrument of a great work, a work terrible in appearance but necessary for a long step forward in the march of the race, a decisive movement in its struggle towards the kingdom of the Right and the Truth, *dharmaṛājya*. The history of the cycles of man is a progress towards the unveiling of the Godhead in the soul and life of humanity; each high event and stage of it is a divine manifestation. Arjuna, the chief instrument of the hidden Will, the great protagonist, must become the divine man capable of doing the work consciously as the action of the Divine. So only can that action become psychically alive and receive its spiritual import and its light and power of secret significance. He is called to self-knowledge; he must see God as the Master of the universe and the origin of the world's creatures and happenings, all as the Godhead's self-expression in Nature, God in all, God in himself as man and as Vibhuti, God in the lownesses of being and on its heights, God on the topmost summits, man too upon heights as the Vibhuti and climbing to the last summits in the supreme liberation and union. Time in its creation and destruction must be seen by him as the figure of the Godhead in its steps, — steps that accomplish the cycles of the cosmos on whose spires of movement the divine spirit in the human body rises doing God's work in the world as his Vibhuti to the supreme transcendences. This knowledge has been given; the Time-figure of the Godhead is now to be revealed and from the million mouths of that figure will issue the command for the appointed action to the liberated Vibhuti.

The Vision of the World-Spirit Time the Destroyer

THE VISION of the universal Purusha is one of the best known and most powerfully poetic passages in the Gita, but its place in the thought is not altogether on the surface. It is evidently intended for a poetic and revelatory symbol and we must see how it is brought in and for what purpose and discover to what it points in its significant aspects before we can capture its meaning. It is invited by Arjuna in his desire to see the living image, the visible greatness of the unseen Divine, the very embodiment of the Spirit and Power that governs the universe. He has heard the highest spiritual secret of existence, that all is from God and all is the Divine and in all things God dwells and is concealed and can be revealed in every finite appearance. The illusion which so persistently holds man's sense and mind, the idea that things at all exist in themselves or for themselves apart from God or that anything subject to Nature can be self-moved and self-guided, has passed from him, — that was the cause of his doubt and bewilderment and refusal of action. Now he knows what is the sense of the birth and passing away of existences. He knows that the imperishable greatness of the divine conscious Soul is the secret of all these appearances. All is a Yoga of this great eternal Spirit in things and all happenings are the result and expression of that Yoga; all Nature is full of the secret Godhead and in labour to reveal him in her. But he would see too the very form and body of this Godhead, if that be possible. He has heard of his attributes and understood the steps and ways of his self-revelation; but now he asks of this Master of the Yoga to discover his very imperishable Self to the eye of Yoga. Not, evidently, the formless silence of his actionless immutability, but the Supreme from whom is all energy and action, of whom forms

are the masks, who reveals his force in the Vibhuti,—the Master of works, the Master of knowledge and adoration, the Lord of Nature and all her creatures. For this greatest all-comprehending vision he is made to ask because it is so, from the Spirit revealed in the universe, that he must receive the command to his part in the world-action.

What thou hast to see, replies the Avatar, the human eye cannot grasp,—for the human eye can see only the outward appearances of things or make out of them separate symbol forms, each of them significant of only a few aspects of the eternal Mystery. But there is a divine eye, an inmost seeing, by which the supreme Godhead in his Yoga can be beheld and that eye I now give to thee. Thou shalt see, he says, my hundreds and thousands of divine forms, various in kind, various in shape and hue; thou shalt see the Adityas and the Rudras and the Maruts and the Aswins; thou shalt see many wonders that none has beheld; thou shalt see today the whole world related and unified in my body and whatever else thou willest to behold. This then is the keynote, the central significance. It is the vision of the One in the many, the Many in the One,—and all are the One. It is this vision that to the eye of the divine Yoga liberates, justifies, explains all that is and was and shall be. Once seen and held, it lays the shining axe of God at the root of all doubts and perplexities and annihilates all denials and oppositions. It is the vision that reconciles and unifies. If the soul can arrive at unity with the Godhead in this vision,—Arjuna has not yet done that, therefore we find that he has fear when he sees,—all even that is terrible in the world loses its terror. We see that it too is an aspect of the Godhead and once we have found his meaning in it, not looking at it by itself alone, we can accept the whole of existence with an all-embracing joy and a mighty courage, go forward with sure steps to the appointed work and envisage beyond it the supreme consummation. The soul admitted to the divine knowledge which beholds all things in one view, not with a divided, partial and therefore bewildered seeing, can make a new discovery of the world and all else that it wills to see, *yac cānyad draṣṭum icchasi*; it can move on the basis of this all-

relating and all-unifying vision from revelation to completing revelation.

The supreme Form is then made visible. It is that of the infinite Godhead whose faces are everywhere and in whom are all the wonders of existence, who multiplies unendingly all the many marvellous revelations of his being, a world-wide Divinity seeing with innumerable eyes, speaking from innumerable mouths, armed for battle with numberless divine uplifted weapons, glorious with divine ornaments of beauty, robed in heavenly raiment of deity, lovely with garlands of divine flowers, fragrant with divine perfumes. Such is the light of this body of God as if a thousand suns had risen at once in heaven. The whole world multitudinously divided and yet unified is visible in the body of the God of Gods. Arjuna sees him, God magnificent and beautiful and terrible, the Lord of souls who has manifested in the glory and greatness of his spirit this wild and monstrous and orderly and wonderful and sweet and terrible world, and overcome with marvel and joy and fear he bows down and adores with words of awe and with clasped hands the tremendous vision. "I see" he cries "all the gods in thy body, O God, and different companies of beings, Brahma the creating lord seated in the Lotus, and the Rishis and the race of the divine Serpents. I see numberless arms and bellies and eyes and faces, I see thy infinite forms on every side, but I see not thy end nor thy middle nor thy beginning, O Lord of the universe, O Form universal. I see thee crowned and with thy mace and thy discus, hard to discern because thou art a luminous mass of energy on all sides of me, an encompassing blaze, a sun-bright fire-bright Immeasurable. Thou art the supreme Immutable whom we have to know, thou art the high foundation and abode of the universe, thou art the imperishable guardian of the eternal laws, thou art the sempiternal soul of existence."

But in the greatness of this vision there is too the terrific image of the Destroyer. This Immeasurable without end or middle or beginning is he in whom all things begin and exist and end. This Godhead who embraces the worlds with his numberless arms and destroys with his million hands, whose eyes are suns

and moons, has a face of blazing fire and is ever burning up the whole universe with the flame of his energy. The form of him is fierce and marvellous and alone it fills all the regions and occupies the whole space between earth and heaven. The companies of the gods enter it, afraid, adoring; the Rishis and the Siddhas crying "May there be peace and weal" praise it with many praises; the eyes of Gods and Titans and Giants are fixed on it in amazement. It has enormous burning eyes; it has mouths that gape to devour, terrible with many tusks of destruction; it has faces like the fires of Death and Time. The kings and the captains and the heroes on both sides of the world-battle are hastening into its tusked and terrible jaws and some are seen with crushed and bleeding heads caught between its teeth of power; the nations are rushing to destruction with helpless speed into its mouths of flame like many rivers hurrying in their course towards the ocean or like moths that cast themselves on a kindled fire. With those burning mouths the Form of Dread is licking all the regions around; the whole world is full of his burning energies and baked in the fierceness of his lustres. The world and its nations are shaken and in anguish with the terror of destruction and Arjuna shares in the trouble and panic around him; troubled and in pain is the soul within him and he finds no peace or gladness. He cries to the dreadful Godhead, "Declare to me who thou art that wearest this form of fierceness. Salutation to thee, O thou great Godhead, turn thy heart to grace. I would know who thou art who wast from the beginning, for I know not the will of thy workings."

This last cry of Arjuna indicates the double intention in the vision. This is the figure of the supreme and universal Being, the Ancient of Days who is for ever, *sanātanam puruṣam purāṇam*, this is he who for ever creates, for Brahma the Creator is one of the Godheads seen in his body, he who keeps the world always in existence, for he is the guardian of the eternal laws, but who is always too destroying in order that he may new-create, who is Time, who is Death, who is Rudra the Dancer of the calm and awful dance, who is Kali with her garland of skulls trampling naked in battle and flecked with the blood of the slaughtered

Titans, who is the cyclone and the fire and the earthquake and pain and famine and revolution and ruin and the swallowing ocean. And it is this last aspect of him which he puts forward at the moment. It is an aspect from which the mind in men willingly turns away and ostrich-like hides its head so that perchance, not seeing, it may not be seen by the Terrible. The weakness of the human heart wants only fair and comforting truths or in their absence pleasant fables; it will not have the truth in its entirety because there is much that is not clear and pleasant and comfortable, but hard to understand and harder to bear. The raw religionist, the superficial optimistic thinker, the sentimental idealist, the man at the mercy of his sensations and emotions agree in twisting away from the sterner conclusions, the harsher and fiercer aspects of universal existence. Indian religion has been ignorantly reproached for not sharing in this general game of hiding, because on the contrary it has built and placed before it the terrible as well as the sweet and beautiful symbols of the Godhead. But it is the depth and largeness of its long thought and spiritual experience that prevent it from feeling or from giving countenance to these feeble shrinkings.

Indian spirituality knows that God is Love and Peace and calm Eternity,— the Gita which presents us with these terrible images, speaks of the Godhead who embodies himself in them as the lover and friend of all creatures. But there is too the sterner aspect of his divine government of the world which meets us from the beginning, the aspect of destruction, and to ignore it is to miss the full reality of the divine Love and Peace and Calm and Eternity and even to throw on it an aspect of partiality and illusion, because the comforting exclusive form in which it is put is not borne out by the nature of the world in which we live. This world of our battle and labour is a fierce dangerous destructive devouring world in which life exists precariously and the soul and body of man move among enormous perils, a world in which by every step forward, whether we will it or no, something is crushed and broken, in which every breath of life is a breath too of death. To put away the responsibility for all that seems to us evil or terrible on the shoulders of a semi-omnipotent Devil,

or to put it aside as part of Nature, making an unbridgeable opposition between world-nature and God-Nature, as if Nature were independent of God, or to throw the responsibility on man and his sins, as if he had a preponderant voice in the making of this world or could create anything against the will of God, are clumsily comfortable devices in which the religious thought of India has never taken refuge. We have to look courageously in the face of the reality and see that it is God and none else who has made this world in his being and that so he has made it. We have to see that Nature devouring her children, Time eating up the lives of creatures, Death universal and ineluctable and the violence of the Rudra forces in man and Nature are also the supreme Godhead in one of his cosmic figures. We have to see that God the bountiful and prodigal creator, God the helpful, strong and benignant preserver is also God the devourer and destroyer. The torment of the couch of pain and evil on which we are racked is his touch as much as happiness and sweetness and pleasure. It is only when we see with the eye of the complete union and feel this truth in the depths of our being that we can entirely discover behind that mask too the calm and beautiful face of the all-blissful Godhead and in this touch that tests our imperfection the touch of the friend and builder of the spirit in man. The discords of the worlds are God's discords and it is only by accepting and proceeding through them that we can arrive at the greater concords of his supreme harmony, the summits and thrilled vastnesses of his transcendent and his cosmic Ananda.

The problem raised by the Gita and the solution it gives demand this character of the vision of the World-Spirit. It is the problem of a great struggle, ruin and massacre which has been brought about by the all-guiding Will and in which the eternal Avatar himself has descended as the charioteer of the protagonist in the battle. The seer of the vision is himself the protagonist, the representative of the battling soul of man who has to strike down tyrant and oppressive powers that stand in the path of his evolution and to establish and enjoy the kingdom of a higher right and nobler law of being. Perplexed by the terrible aspect of the catastrophe in which kindred smite at kindred, whole nations

are to perish and society itself seems doomed to sink down in a pit of confusion and anarchy, he has shrunk back, refused the task of destiny and demanded of his divine Friend and Guide why he is appointed to so dreadful a work, *kim karmani ghore mām niyojayasi*. He has been shown then how individually to rise above the apparent character of whatever work he may do, to see that Nature the executive force is the doer of the work, his natural being the instrument, God the master of Nature and of works to whom he must offer them without desire or egoistic choice as a sacrifice. He has been shown too that the Divine who is above all these things and untouched by them, yet manifests himself in man and Nature and their action and that all is a movement in the cycles of this divine manifestation. But now when he is put face to face with the embodiment of this truth, he sees in it magnified by the image of the divine greatness this aspect of terror and destruction and is appalled and can hardly bear it. For why should it be thus that the All-spirit manifests himself in Nature? What is the significance of this creating and devouring flame that is mortal existence, this world-wide struggle, these constant disastrous revolutions, this labour and anguish and travail and perishing of creatures? He puts the ancient question and breathes the eternal prayer, "Declare to me who art thou that comest to us in this form of fierceness. I would know who art thou who wast from the beginning, for I know not the will of thy workings. Turn thy heart to grace."

Destruction, replies the Godhead, is the will of my workings with which I stand here on this field of Kurukshetra, the field of the working out of the Dharma, the field of human action,—as we might symbolically translate the descriptive phrase, *dharma-kṣetre kuru-kṣetre*,—a world-wide destruction which has come in the process of the Time-Spirit. I have a foreseeing purpose which fulfils itself infallibly and no participation or abstention of any human being can prevent, alter or modify it; all is done by me already in my eternal eye of will before it can at all be done by man upon earth. I as Time have to destroy the old structures and to build up a new, mighty and splendid kingdom. Thou as a human instrument of the divine Power and Wisdom hast in this

struggle which thou canst not prevent to battle for the right and slay and conquer its opponents. Thou too, the human soul in Nature, hast to enjoy in Nature the fruit given by me, the empire of right and justice. Let this be sufficient for thee,—to be one with God in thy soul, to receive his command, to do his will, to see calmly a supreme purpose fulfilled in the world. “I am Time the waster of the peoples arisen and increased whose will in my workings is here to destroy the nations. Even without thee all these warriors shall be not, who are ranked in the opposing armies. Therefore arise, get thee glory, conquer thy enemies and enjoy an opulent kingdom. By me and none other already even are they slain, do thou become the occasion only, O Savyasachin. Slay, by me who are slain, Drona, Bhishma, Jayadratha, Karna and other heroic fighters; be not pained and troubled. Fight, thou shalt conquer the adversary in the battle.” The fruit of the great and terrible work is promised and prophesied, not as a fruit hungered for by the individual,—for to that there is to be no attachment,—but as the result of the divine will, the glory and success of the thing to be done accomplished, the glory given by the Divine to himself in his Vibhuti. Thus is the final and compelling command to action given to the protagonist of the world-battle.

It is the Timeless manifest as Time and World-Spirit from whom the command to action proceeds. For certainly the God-head when he says, “I am Time the Destroyer of beings,” does not mean either that he is the Time-Spirit alone or that the whole essence of the Time-Spirit is destruction. But it is this which is the present will of his workings, *pravṛtti*. Destruction is always a simultaneous or alternate element which keeps pace with creation and it is by destroying and renewing that the Master of Life does his long work of preservation. More, destruction is the first condition of progress. Inwardly, the man who does not destroy his lower self-formations, cannot rise to a greater existence. Outwardly also, the nation or community or race which shrinks too long from destroying and replacing its past forms of life, is itself destroyed, rots and perishes and out of its debris other nations, communities and races are formed. By destruction

of the old giant occupants man made himself a place upon earth. By destruction of the Titans the gods maintain the continuity of the divine Law in the cosmos. Whoever prematurely attempts to get rid of this law of battle and destruction, strives vainly against the greater will of the World-Spirit. Whoever turns from it in the weakness of his lower members, as did Arjuna in the beginning,— therefore was his shrinking condemned as a small and false pity, an inglorious, an un-Aryan and unheavenly feebleness of heart and impotence of spirit, *klaibyam*, *kṣudram* *ḥṛdaya-daurbalyam*,— is showing not true virtue, but a want of spiritual courage to face the sterner truths of Nature and of action and existence. Man can only exceed the law of battle by discovering the greater law of his immortality. There are those who seek this where it always exists and must primarily be found, in the higher reaches of the pure spirit, and to find it turn away from a world governed by the law of Death. That is an individual solution which makes no difference to mankind and the world, or rather makes only this difference that they are deprived of so much spiritual power which might have helped them forward in the painful march of their evolution.

What then is the master man, the divine worker, the opened channel of the universal Will to do when he finds the World-Spirit turned towards some immense catastrophe, figured before his eyes as Time the destroyer arisen and increased for the destruction of the nations, and himself put there in the forefront whether as a fighter with physical weapons or a leader and guide or an inspirer of men, as he cannot fail to be by the very force of his nature and the power within him, *svabhāvajena svena karmanā?* To abstain, to sit silent, to protest by non-intervention? But abstention will not help, will not prevent the fulfilment of the destroying Will, but rather by the lacuna it creates increase confusion. Even without thee, cries the Godhead, my will of destruction would still be accomplished, *rte'pi tvām*. If Arjuna were to abstain or even if the battle of Kurukshetra were not to be fought, that evasion would only prolong and make worse the inevitable confusion, disorder, ruin that are coming. For these things are no accident, but an inevitable seed that

has been sown and a harvest that must be reaped. They who have sown the wind, must reap the whirlwind. Nor indeed will his own nature allow him any real abstention, *prakṛtis tvāṁ niyokṣyati*. This the Teacher tells Arjuna at the close, "That which in thy egoism thou thinkest saying, I will not fight, vain is this thy resolve: Nature shall yoke thee to thy work. Bound by thy own action which is born of the law of thy being, what from delusion thou desirest not to do, that thou shalt do even perforce." Then to give another turn, to use some kind of soul force, spiritual method and power, not physical weapons? But that is only another form of the same action; the destruction will still take place, and the turn given too will be not what the individual ego, but what the World-Spirit wills. Even, the force of destruction may feed on this new power, may get a more formidable impetus and Kali arise filling the world with a more terrible sound of her laughter. No real peace can be till the heart of man deserves peace; the law of Vishnu cannot prevail till the debt to Rudra is paid. To turn aside then and preach to a still unevolved mankind the law of love and oneness? Teachers of the law of love and oneness there must be, for by that way must come the ultimate salvation. But not till the Time-Spirit in man is ready, can the inner and ultimate prevail over the outer and immediate reality. Christ and Buddha have come and gone, but it is Rudra who still holds the world in the hollow of his hand. And meanwhile the fierce forward labour of mankind tormented and oppressed by the Powers that are profiteers of egoistic force and their servants cries for the sword of the Hero of the struggle and the word of its prophet.

The highest way appointed for him is to carry out the will of God without egoism, as the human occasion and instrument of that which he sees to be decreed, with the constant supporting memory of the Godhead in himself and man, *mām anusmaran*, and in whatever ways are appointed for him by the Lord of his Nature. *Nimittamātram bhava savyasācin*. He will not cherish personal enmity, anger, hatred, egoistic desire and passion, will not hasten towards strife or lust after violence and destruction like the fierce Asura, but he will do his work, *lokasaṅgrahāya*.

Beyond the action he will look towards that to which it leads, that for which he is warring. For God the Time-Spirit does not destroy for the sake of destruction, but to make the ways clear in the cyclic process for a greater rule and a progressing manifestation, *rājyam samṛddham*. He will accept in its deeper sense, which the superficial mind does not see, the greatness of the struggle, the glory of the victory,—if need be, the glory of the victory which comes masked as defeat,—and lead man too in the enjoyment of his opulent kingdom. Not appalled by the face of the Destroyer, he will see within it the eternal Spirit imperishable in all these perishing bodies and behind it the face of the Charioteer, the Leader of man, the Friend of all creatures, *suḥṛdam sarvabhūtānām*. This formidable World-Form once seen and acknowledged, it is to that reassuring truth that the rest of the chapter is directed; it discloses in the end a more intimate face and body of the Eternal.

The Vision of the World-Spirit¹ The Double Aspect

EVEN WHILE the effects of the terrible aspect of this vision are still upon him, the first words uttered by Arjuna after the Godhead has spoken are eloquent of a greater uplifting and reassuring reality behind this face of death and this destruction. "Rightly and in good place," he cries, "O Krishna, does the world rejoice and take pleasure in thy name, the Rakshasas are fleeing from thee in terror to all the quarters and the companies of the Siddhas bow down before thee in adoration. How should they not do thee homage, O great Spirit? For thou art the original Creator and Doer of works and greater even than creative Brahma. O thou Infinite, O thou Lord of the gods, O thou abode of the universe, thou art the Immutable and thou art what is and is not and thou art that which is the Supreme. Thou art the ancient Soul and the first and original Godhead and the supreme resting-place of this All; thou art the knower and that which is to be known and the highest status; O infinite in form, by thee was extended the universe. Thou art Yama and Vayu and Agni and Soma and Varuna and Prajapati, father of creatures, and the great-grandsire. Salutation to thee a thousand times over and again and yet again salutation, in front and behind and from every side, for thou art each and all that is. Infinite in might and immeasurable in strength of action thou pervadest all and art every one."

But this supreme universal Being has lived here before him with the human face, in the mortal body, the divine Man, the embodied Godhead, the Avatar, and till now he has not known him. He has seen the humanity only and has treated the Divine as

¹ Gita, XI. 35-55.

a mere human creature. He has not pierced through the earthly mask to the Godhead of which the humanity was a vessel and a symbol, and he prays now for that Godhead's forgiveness of his unseeing carelessness and his negligent ignorance. "For whatsoever I have spoken to thee in rash vehemence, thinking of thee only as my human friend and companion, 'O Krishna, O Yadava, O comrade,' not knowing this thy greatness, in negligent error or in love, and for whatsoever disrespect was shown by me to thee in jest, on the couch and the seat and in the banquet, alone or in thy presence, I pray forgiveness from thee the immeasurable. Thou art the father of all this world of the moving and unmoving; thou art one to be worshipped and the most solemn object of veneration. None is equal to thee, how then another greater in all the three worlds, O incomparable in might? Therefore I bow down before thee and prostrate my body and I demand grace of thee the adorable Lord. As a father to his son, as a friend to his friend and comrade, as one dear with him he loves, so shouldst thou, O Godhead, bear with me. I have seen what never was seen before and I rejoice, but my mind is troubled with fear. O Godhead, show me that other form of thine. I would see thee even as before crowned and with thy mace and discus. Assume thy four-armed shape, O thousand-armed, O Form universal."

From the first words there comes the suggestion that the hidden truth behind these terrifying forms is a reassuring, a heartening and delightful truth. There is something that makes the heart of the world to rejoice and take pleasure in the name and nearness of the Divine. It is the profound sense of that which makes us see in the dark face of Kali the face of the Mother and to perceive even in the midst of destruction the protecting arms of the Friend of creatures, in the midst of evil the presence of a pure unalterable Benignity and in the midst of death the Master of Immortality. From the terror of the King of the divine action the Rakshasas, the fierce giant powers of darkness, flee destroyed, defeated and overpowered. But the Siddhas, but the complete and perfect who know and sing the names of the Immortal and live in the truth of his being, bow down before every form of

Him and know what every form enshrines and signifies. Nothing has real need to fear except that which is to be destroyed, the evil, the ignorance, the veilers in Night, the Rakshasa powers. All the movement and action of Rudra the Terrible is towards perfection and divine light and completeness.

For this Spirit, this Divine is only in outward form the Destroyer, Time who undoes all these finite forms: but in himself he is the Infinite, the Master of the cosmic Godheads, in whom the world and all its action are securely seated. He is the original and ever originating Creator, one greater than that figure of creative Power called Brahma which he shows to us in the form of things as one aspect of his trinity, creation chequered by a balance of preservation and destruction. The real divine creation is eternal; it is the Infinite manifested sempiternally in finite things, the Spirit who conceals and reveals himself for ever in his innumerable infinity of souls and in the wonder of their actions and in the beauty of their forms. He is the eternal Immutable; he is the dual appearance of the Is and Is-not, of the manifest and the never manifested, of things that were and seem to be no more, are and appear doomed to perish, shall be and shall pass. But what he is beyond all these is That, the Supreme, who holds all things mutable in the single eternity of a Time to which all is ever present. He possesses his immutable self in a timeless eternity of which Time and creation are an ever extending figure.

This is the Truth of him in which all is reconciled; a harmony of simultaneous and interdependent truths start from and amount to the one that is real. It is the truth of a supreme Soul of whose supreme nature the world is a derivation and an inferior figure of that Infinite; of the Ancient of Days who for ever presides over the long evolutions of Time; of the original Godhead of whom Gods and men and all living creatures are the children, the powers, the souls, spiritually justified in their being by his truth of existence; of the Knower who develops in man the knowledge of himself and world and God; of the one Object of all knowing who reveals himself to man's heart and mind and soul, so that every new opening form of our knowledge is a partial unfolding of him, up to the highest by which he is

intimately, profoundly and integrally seen and discovered. This is the high supreme Stability who originates and supports and receives to himself all that are in the universe. By him in his own existence the world is extended, by his omnipotent power, by his miraculous self-conception and energy and Ananda of never-ending creation. All is an infinity of his material and spiritual forms. He is all the many gods from the least to the greatest; he is the father of creatures and all are his children and his people. He is the origin of Brahma, the father to the first father of the divine creators of these different races of living things. On this truth there is a constant insistence. Again it is repeated that he is the All, he is each and every one, *sarvah*. He is the infinite Universal and he is each individual and everything that is, the one Force and Being in every one of us, the infinite Energy that throws itself out in these multitudes, the immeasurable Will and mighty Power of motion and action that forms out of itself all the courses of Time and all the happenings of the spirit in Nature.

And from that insistence the thought naturally turns to the presence of this one great Godhead in man. There the soul of the seer of the vision is impressed by three successive suggestions. First, it is borne in upon him that in the body of this son of Man who moved beside him as a transient creature upon earth and sat by his side and lay with him on the same couch and ate with him in the banquet and was the object of jest and careless word, actor in war and council and common things, in this figure of mortal man was all the time something great, concealed, of tremendous significance, a Godhead, an Avatar, a universal Power, a One Reality, a supreme Transcendence. To this occult divinity in which all the significance of man and his long race is wrapped and from which all world-existence receives its inner meaning of ineffable greatness, he had been blind. Now only he sees the universal Spirit in the individual frame, the Divine embodied in humanity, the transcendent Inhabitant of this symbol of Nature. He has seen now only this tremendous, infinite, immeasurable Reality of all these apparent things, this boundless universal Form which so exceeds every individual form and yet of whom each individual thing is a house for his dwelling. For that great Reality is equal

and infinite and the same in the individual and in the universe. And at first his blindness, his treatment of this Divine as the mere outward man, his seeing of only the mental and physical relation seems to him a sin against the Mightiness that was there. For the being whom he called Krishna, Yadava, comrade, was this immeasurable Greatness, this incomparable Might, this Spirit one in all of whom all are the creations. That and not the veiling outward humanity, *avajānan mānuṣīm tanum āśritam*, was what he should have seen with awe and with submission and veneration.

But the second suggestion is that what was figured in the human manifestation and the human relation is also a reality which accompanies and mitigates for our mind the tremendous character of the universal vision. The transcendence and cosmic aspect have to be seen, for without that seeing the limitations of humanity cannot be exceeded. In that unifying oneness all has to be included. But by itself that would set too great a gulf between the transcendent spirit and this soul bound and circumscribed in an inferior Nature. The infinite presence in its unmitigated splendour would be too overwhelming for the separate littleness of the limited, individual and natural man. A link is needed by which he can see this universal Godhead in his own individual and natural being, close to him, not only omnipotently there to govern all he is by universal and immeasurable Power, but humanly figured to support and raise him to unity by an intimate individual relation. The adoration by which the finite creature bows down before the Infinite, receives all its sweetness and draws near to a closest truth of companionship and oneness when it deepens into the more intimate adoration which lives in the sense of the fatherhood of God, the friendhood of God, the attracting love between the Divine Spirit and our human soul and nature. For the Divine inhabits the human soul and body; he draws around him and wears like a robe the human mind and figure. He assumes the human relations which the soul affects in the mortal body and they find in God their own fullest sense and greatest realisation. This is the Vaishnava bhakti of which the seed is here in the Gita's words, but which received afterwards

a more deep, ecstatic and significant extension.

And from this second suggestion a third immediately arises. The form of the transcendent and universal Being is to the strength of the liberated spirit a thing mighty, encouraging and fortifying, a source of power, an equalising, sublimating, all-justifying vision; but to the normal man it is overwhelming, appalling, incomunicable. The truth that reassures, even when known, is grasped with difficulty behind the formidable and mighty aspect of all-destructive Time and an incalculable Will and a vast immeasurable inextricable working. But there is too the gracious mediating form of divine Narayana, the God who is so close to man and in man, the Charioteer of the battle and the journey, with his four arms of helpful power, a humanised symbol of Godhead, not this million-armed universality. It is this mediating aspect which man must have for his support constantly before him. For it is this figure of Narayana which symbolises the truth that reassures. It makes close, visible, living, seizable the vast spiritual joy in which for the inner spirit and life of man the universal workings behind all their stupendous circling, retrogression, progression sovereignly culminate, their marvellous and auspicious upshot. To this humanised embodied soul their end becomes here a union, a closeness, a constant companionship of man and God, man living in the world for God, God dwelling in man and turning to his own divine ends in him the enigmatic world-process. And beyond the end is a yet more wonderful oneness and inliving in the last transfigurations of the Eternal.

The Godhead in answer to Arjuna's prayer reassumes his own normal Narayana image, *svakām rūpam*, the desired form of grace and love and sweetness and beauty. But first he declares the incalculable significance of the other mighty Image which he is about to veil. "This that thou now seest," he tells him, "is my supreme shape, my form of luminous energy, the universal, the original which none but thou amongst men has yet seen. I have shown it by my self-Yoga. For it is an image of my very Self and Spirit, it is the very Supreme self-figured in cosmic existence and the soul in perfect Yoga with me sees it without any trembling

of the nervous parts or any bewilderment and confusion of the mind, because he descries not only what is terrible and overwhelming in its appearance, but also its high and reassuring significance. And thou also shouldst so envisage it without fear, without confusion of mind, without any sinking of the members; but since the lower nature in thee is not yet prepared to look upon it with that high strength and tranquillity, I will reassume again for thee my Narayana figure in which the human mind sees isolated and toned to its humanity the calm, helpfulness and delight of a friendly Godhead. The greater Form”—and this is repeated again after it has disappeared—“is only for the rare highest souls. The gods themselves ever desire to look upon it. It cannot be won by Veda or austerities or gifts or sacrifice; it can be seen, known, entered into only by that bhakti which regards, adores and loves Me alone in all things.”

But what then is the uniqueness of this Form by which it is lifted so far beyond cognizance that all the ordinary endeavour of human knowledge and even the inmost austerity of its spiritual effort are insufficient, unaided, to reach the vision? It is this that man can know by other means this or that exclusive aspect of the one existence, its individual, cosmic or world-excluding figures, but not this greatest reconciling Oneness of all the aspects of the Divinity in which at one and the same time and in one and the same vision all is manifested, all is exceeded and all is consummated. For here transcendent, universal and individual Godhead, Spirit and Nature, Infinite and finite, space and time and timelessness, Being and Becoming, all that we can strive to think and know of the Godhead, whether of the absolute or the manifested existence, are wonderfully revealed in an ineffable oneness. This vision can be reached only by the absolute adoration, the love, the intimate unity that crowns at their summit the fullness of works and knowledge. To know, to see, to enter into it, to be one with this supreme form of the Supreme becomes then possible, and it is that end which the Gita proposes for its Yoga. There is a supreme consciousness through which it is possible to enter into the glory of the Transcendent and contain in him the immutable Self and all mutable Becoming,—

it is possible to be one with all, yet above all, to exceed world and yet embrace the whole nature at once of the cosmic and the supracosmic Godhead. This is difficult indeed for limited man imprisoned in his mind and body: but, says the Godhead, “be a doer of my works, accept me as the supreme being and object, become my bhakta, be free from attachment and without enmity to all existences; for such a man comes to me.” In other words superiority to the lower nature, unity with all creatures, oneness with the cosmic Godhead and the Transcendence, oneness of will with the Divine in works, absolute love for the One and for God in all,—this is the way to that absolute spiritual self-exceeding and that unimaginable transformation.

The Way and the Bhakta

IN THE eleventh chapter of the Gita the original object of the teaching has been achieved and brought up to a certain completeness. The command to divine action done for the sake of the world and in union with the Spirit who dwells in it and in all its creatures and in whom all its working takes place, has been given and accepted by the Vibhuti. The disciple has been led away from the old poise of the normal man and the standards, motives, outlook, egoistic consciousness of his ignorance, away from all that had finally failed him in the hour of his spiritual crisis. The very action which on that standing he had rejected, the terrible function, the appalling labour, he has now been brought to admit and accept on a new inner basis. A reconciling greater knowledge, a diviner consciousness, a high impersonal motive, a spiritual standard of oneness with the will of the Divine acting on the world from the fountain light and with the motive power of the spiritual nature,—this is the new inner principle of works which is to transform the old ignorant action. A knowledge which embraces oneness with the Divine and arrives through the Divine at conscious oneness with all things and beings, a will emptied of egoism and acting only by the command and as an instrumentation of the secret Master of works, a divine love whose one aspiration is towards a close intimacy with the supreme Soul of all existence, accomplished by the unity of these three perfected powers an inner all-comprehending unity with the transcendent and universal Spirit and Nature and all creatures are the foundation offered for his activities to the liberated man. For from that foundation the soul in him can suffer the instrumental nature to act in safety; he is lifted above all cause of stumbling, delivered from egoism and its limitations, rescued from all fear of sin and evil and consequence, exalted out of that bondage to the outward nature

and the limited action which is the knot of the Ignorance. He can act in the power of the Light, no longer in twilight or darkness, and a divine sanction upholds every step of his conduct. The difficulty which had been raised by the antinomy between the freedom of the Spirit and the bondage of the soul in Nature, has been solved by a luminous reconciliation of Spirit with Nature. That antinomy exists for the mind in the ignorance; it ceases to exist for the spirit in its knowledge.

But there is something more to be said in order to bring out all the meaning of the great spiritual change. The twelfth chapter leads up to this remaining knowledge and the last six that follow develop it to a grand final conclusion. This thing that remains still to be said turns upon the difference between the current Vedantic view of spiritual liberation and the larger comprehensive freedom which the teaching of the Gita opens to the spirit. There is now a pointed return to that difference. The current Vedantic way led through the door of an austere and exclusive knowledge. The Yoga, the oneness which it recognised as the means and the absorbing essence of the spiritual release, was a Yoga of pure knowledge and a still oneness with a supreme Immutable, an absolute Indefinable,—the unmanifested Brahman, infinite, silent, intangible, aloof, far above all this universe of relations. In the way proposed by the Gita knowledge is indeed the indispensable foundation, but an integral knowledge. Impersonal integral works are the first indispensable means; but a deep and large love and adoration, to which a relationless Unmanifest, an aloof and immovable Brahman can return no answer, since these things ask for a relation and an intimate personal closeness, are the strongest and highest power for release and spiritual perfection and the immortal Ananda. The Godhead with whom the soul of man has to enter into this closest oneness, is indeed in his supreme status a transcendent Unthinkable too great for any manifestation, Parabrahman; but he is at the same time the living supreme Soul of all things. He is the supreme Lord, the Master of works and universal nature. He at once exceeds and inhabits as its self the soul and mind and body of the creature. He is Purushottama, Parameshwara and

Paramatman and in all these equal aspects the same single and eternal Godhead. It is an awakening to this integral reconciling knowledge that is the wide gate to the utter release of the soul and an unimaginable perfection of the nature. It is this Godhead in the unity of all his aspects to whom our works and our adoration and our knowledge have to be directed as a constant inner sacrifice. It is this supreme soul, Purushottama, transcendent of the universe, but also its containing spirit, inhabitant and possessor, even as it is mightily figured in the vision of Kurukshetra, into whom the liberated spirit has to enter once it has reached to the vision and knowledge of him in all the principles and powers of his existence, once it is able to grasp and enjoy his multitudinous oneness, *jñātum draṣṭum tattvena praveṣṭum ca*.

The liberation of the Gita is not a self-oblivious abolition of the soul's personal being in the absorption of the One, *sāyujya mukti*; it is all kinds of union at once. There is an entire unification with the supreme Godhead in essence of being and intimacy of consciousness and identity of bliss, *sāyujya*, — for one object of this Yoga is to become Brahman, *brahmabhūta*. There is an eternal ecstatic dwelling in the highest existence of the Supreme, *sālokya*, — for it is said, "Thou shalt dwell in me," *nivasiṣyasi mayyeva*. There is an eternal love and adoration in a uniting nearness, there is an embrace of the liberated spirit by its divine Lover and the enveloping Self of its infinitudes, *sāmīpya*. There is an identity of the soul's liberated nature with the divine nature, *sādr̥ṣya mukti*, — for the perfection of the free spirit is to become even as the Divine, *madbhāvam āgataḥ*, and to be one with him in the law of its being and the law of its works and nature, *sādharmyam āgataḥ*. The orthodox Yoga of knowledge aims at a fathomless immersion in the one infinite existence, *sāyujya*; it looks upon that alone as the entire liberation. The Yoga of adoration envisages an eternal habitation or nearness as the greater release, *sālokya*, *sāmīpya*. The Yoga of works leads to oneness in power of being and nature, *sādr̥ṣya*. But the Gita envelops them all in its catholic integrality and fuses them all into one greatest and richest divine freedom and perfection.

Arjuna is made to raise the question of this difference. It

must be remembered that the distinction between the impersonal immutable Akshara Purusha and the supreme Soul that is at once impersonality and divine Person and much more than either—that this capital distinction implied in the later chapters and in the divine “I” of which Krishna has constantly spoken, *aham, mām*, has as yet not been quite expressly and definitely drawn. We have been throughout anticipating it in order to understand from the beginning the full significance of the Gita’s message and not have to go back again, as we would otherwise be obliged, over the same ground newly seen and prospected in the light of this greater truth. Arjuna has been enjoined first to sink his separate personality in the calm impersonality of the one eternal and immutable self, a teaching which agreed well with his previous notions and offered no difficulties. But now he is confronted with the vision of this greatest transcendent, this widest universal Godhead and commanded to seek oneness with him by knowledge and works and adoration. Therefore he asks the better to have a doubt cleared which might otherwise have arisen, “Those devotees who thus by a constant union seek after thee, *tvām*, and those who seek after the unmanifest Immutable, which of these have the greater knowledge of Yoga?” This recalls the distinction made in the beginning by such phrases as “in the self, then in me,” *ātmani atho mayi*: Arjuna points the distinction, *tvām, akṣaram avyaktam*. Thou, he says in substance, art the supreme Source and Origin of all beings, a Presence immanent in all things, a Power pervading the universe with thy forms, a Person manifest in thy Vibhutis, manifest in creatures, manifest in Nature, seated as the Lord of works in the world and in our hearts by thy mighty world-Yoga. As such I have to know, adore, unite myself with thee in all my being, consciousness, thoughts, feelings and actions, *satata-yukta*. But what then of this Immutable who never manifests, never puts on any form, stands back and apart from all action, enters into no relation with the universe or with anything in it, is eternally silent and one and impersonal and immobile? This eternal Self is the greater Principle according to all current notions and the Godhead in the manifestation is an inferior figure:

the unmanifest and not the manifest is the eternal Spirit. How then does the union which admits the manifestation, admits the lesser thing, come yet to be the greater Yoga-knowledge?

To this question Krishna replies with an emphatic decisiveness. "Those who found their mind in Me and by constant union, possessed of a supreme faith, seek after Me, I hold to be the most perfectly in union of Yoga." The supreme faith is that which sees God in all and to its eye the manifestation and the non-manifestation are one Godhead. The perfect union is that which meets the Divine at every moment, in every action and with all the integrality of the nature. But those also who seek by a hard ascent after the indefinable unmanifest Immutable alone, arrive, says the Godhead, to Me. For they are not mistaken in their aim, but they follow a more difficult and a less complete and perfect path. At the easiest, to reach the unmanifest Absolute they have to climb through the manifest Immutable here. This manifest Immutable is my own all-pervading impersonality and silence; vast, unthinkable, immobile, constant, omnipresent, it supports the action of personality but does not share in it. It offers no hold to the mind; it can only be gained by a motionless spiritual impersonality and silence and those who follow after it alone have to restrain altogether and even draw in completely the action of the mind and senses. But still by the equality of their understanding and by their seeing of one self in all things and by their tranquil benignancy of silent will for the good of all existences they too meet me in all objects and creatures. No less than those who unite themselves with the Divine in all ways of their existence, *sarva-bhāvena*, and enter largely and fully into the unthinkable living fountainhead of universal things, *divyam puruṣam acintya-rūpam*, these seekers too who climb through this more difficult exclusive oneness towards a relationless unmanifest Absolute find in the end the same Eternal. But this is a less direct and more arduous way; it is not the full and natural movement of the spiritualised human nature.

And it must not be thought that because it is more arduous, therefore it is a higher and more effective process. The easier way of the Gita leads more rapidly, naturally and normally to

the same absolute liberation. For its acceptance of the divine Person does not imply any attachment to the mental and sensuous limitations of embodied Nature. On the contrary it brings a swift and effectual unchaining from the phenomenal bondage of death and birth. The Yогin of exclusive knowledge imposes on himself a painful struggle with the manifold demands of his nature; he denies them even their highest satisfaction and cuts away from him even the upward impulses of his spirit whenever they imply relations or fall short of a negating absolute. The living way of the Gita on the contrary finds out the most intense upward trend of all our being and by turning it Godwards uses knowledge, will, feeling and the instinct for perfection as so many puissant wings of a mounting liberation. The unmanifest Brahman in its indefinable unity is a thing to which embodied souls can only arrive and that hardly by a constant mortification, a suffering of all the repressed members, a stern difficulty and anguish of the nature, *duḥkham avāpyate, kleśo 'dhikataras teṣām*. The indefinable Oneness accepts all that climb to it, but offers no help of relation and gives no foothold to the climber. All has to be done by a severe austerity and a stern and lonely individual effort. How different is it for those who seek after the Purushottama in the way of the Gita! When they meditate on him with a Yoga which sees none else, because it sees all to be Vasudeva, he meets them at every point, in every movement, at all times, with innumerable forms and faces, holds up the lamp of knowledge within and floods with its divine and happy lustre the whole of existence. Illumined, they discern the supreme Spirit in every form and face, arrive at once through all Nature to the Lord of Nature, arrive through all beings to the Soul of all being, arrive through themselves to the Self of all that they are; incontinently they break through a hundred opening issues at once into that from which everything has its origin. The other method of a difficult relationless stillness tries to get away from all action even though that is impossible to embodied creatures. Here the actions are all given up to the supreme Master of action and he as the supreme Will meets the will of sacrifice, takes from it its burden and assumes to himself the charge of the works of

the divine Nature in us. And when too in the high passion of love the devotee of the Lover and Friend of man and of all creatures casts upon him all his heart of consciousness and yearning of delight, then swiftly the Supreme comes to him as the saviour and deliverer and exalts him by a happy embrace of his mind and heart and body out of the waves of the sea of death in this mortal nature into the secure bosom of the Eternal.

This then is the swiftest, largest and greatest way. On me, says the Godhead to the soul of man, repose all thy mind and lodge all thy understanding in me: I will lift them up bathed in the supernal blaze of the divine love and will and knowledge to myself from whom these things flow. Doubt not that thou shalt dwell in me above this mortal existence. The chain of the limiting earthly nature cannot hold the immortal spirit exalted by the passion, the power and the light of the eternal love, will and knowledge. No doubt, on this way too there are difficulties; for there is the lower nature with its fierce or dull downward gravitation which resists and battles against the motion of ascent and clogs the wings of the exaltation and the upward rapture. The divine consciousness even when it has been found at first in a wonder of great moments or in calm and splendid durations, cannot at once be altogether held or called back at will; there is felt often an inability to keep the personal consciousness fixed steadily in the Divine; there are nights of long exile from the Light, there are hours or moments of revolt, doubt or failure. But still by the practice of union and by constant repetition of the experience, that highest spirit grows upon the being and takes permanent possession of the nature. Is this also found too difficult because of the power and persistence of the outward-going movement of the mind? Then the way is simple, to do all actions for the sake of the Lord of the action, so that every outward-going movement of the mind shall be associated with the inner spiritual truth of the being and called back even in the very movement to the eternal reality and connected with its source. Then the presence of the Purushottama will grow upon the natural man till he is filled with it and becomes a godhead and a spirit; all life will become a constant remembering of God

and perfection too will grow and the unity of the whole existence of the human soul with the supreme Existence.

But it may be that even this constant remembering of God and lifting up of our works to him is felt to be beyond the power of the limited mind, because in its forgetfulness it turns to the act and its outward object and will not remember to look within and lay our every movement on the divine altar of the Spirit. Then the way is to control the lower self in the act and do works without desire of the fruit. All fruit has to be renounced, to be given up to the Power that directs the work, and yet the work has to be done that is imposed by It on the nature. For by this means the obstacle steadily diminishes and easily disappears; the mind is left free to remember the Lord and to fix itself in the liberty of the divine consciousness. And here the Gita gives an ascending scale of potencies and assigns the palm of excellence to this Yoga of desireless action. *Abhyāsa*, practice of a method, repetition of an effort and experience is a great and powerful thing; but better than this is knowledge, the successful and luminous turning of the thought to the Truth behind things. This thought-knowledge too is excelled by a silent complete concentration on the Truth so that the consciousness shall eventually live in it and be always one with it. But more powerful still is the giving up of the fruit of one's works, because that immediately destroys all causes of disturbance and brings and preserves automatically an inner calm and peace, and calm and peace are the foundation on which all else becomes perfect and secure in possession by the tranquil spirit. Then the consciousness can be at ease, happily fix itself in the Divine and rise undisturbed to perfection. Then too knowledge, will and devotion can lift their pinnacles from a firm soil of solid calm into the ether of Eternity.

What then will be the divine nature, what will be the greater state of consciousness and being of the bhakta who has followed this way and turned to the adoration of the Eternal? The Gita in a number of verses rings the changes on its first insistent demand, on equality, on desirelessness, on freedom of spirit. This is to be the base always,— and that was why so much stress was laid on it in the beginning. And in that equality bhakti, the love and

adoration of the Purushottama must rear the spirit towards some greatest highest perfection of which this calm equality will be the wide foundation. Several formulas of this fundamental equal consciousness are given here. First, an absence of egoism, of I-ness and my-ness, *nirmamo nirahaṅkāraḥ*. The bhakta of the Purushottama is one who has a universal heart and mind which has broken down all the narrow walls of the ego. A universal love dwells in his heart, a universal compassion flows from it like an encompassing sea. He will have friendship and pity for all beings and hate for no living thing: for he is patient, long-suffering, enduring, a well of forgiveness. A desireless content is his, a tranquil equality to pleasure and pain, suffering and happiness, the steadfast control of self and the firm unshakable will and resolution of the Yogin and a love and devotion which gives up the whole mind and reason to the Lord, to the Master of his consciousness and knowledge. Or, simply, he will be one who is freed from the troubled agitated lower nature and from its waves of joy and fear and anxiety and resentment and desire, a spirit of calm by whom the world is not afflicted or troubled, nor is he afflicted or troubled by the world, a soul of peace with whom all are at peace.

Or he will be one who has given up all desire and action to the Master of his being, one pure and still, indifferent to whatever comes, not pained or afflicted by any result or happening, one who has flung away from him all egoistic, personal and mental initiative whether of the inner or the outer act, one who lets the divine will and divine knowledge flow through him undeflected by his own resolves, preferences and desires, and yet for that very reason is swift and skilful in all action of his nature, because this flawless unity with the supreme will, this pure instrumentation is the condition of the greatest skill in works. Again, he will be one who neither desires the pleasant and rejoices at its touch nor abhors the unpleasant and sorrows at its burden. He has abolished the distinction between fortunate and unfortunate happenings, because his devotion receives all things equally as good from the hands of his eternal Lover and Master. The God-lover dear to God is a soul of wide equality,

equal to friend and enemy, equal to honour and insult, pleasure and pain, praise and blame, grief and happiness, heat and cold, to all that troubles with opposite affections the normal nature. He will have no attachment to person or thing, place or home; he will be content and well-satisfied with whatever surroundings, whatever relation men adopt to him, whatever station or fortune. He will keep a mind firm in all things, because it is constantly seated in the highest self and fixed for ever on the one divine object of his love and adoration. Equality, desirelessness and freedom from the lower egoistic nature and its claims are always the one perfect foundation demanded by the Gita for the great liberation. There is to the end an emphatic repetition of its first fundamental teaching and original desideratum, the calm soul of knowledge that sees the one self in all things, the tranquil egoless equality that results from this knowledge, the desireless action offered in that equality to the Master of works, the surrender of the whole mental nature of man into the hands of the mightier indwelling spirit. And the crown of this equality is love founded on knowledge, fulfilled in instrumental action, extended to all things and beings, a vast absorbing and all-containing love for the divine Self who is Creator and Master of the universe, *suhṛdam sarva-bhūtānāṁ sarva-loka-maheśvaram*.

This is the foundation, the condition, the means by which the supreme spiritual perfection is to be won, and those who have it in any way are all dear to me, says the Godhead, *bhaktimān me priyah*. But exceedingly dear, *atīva me priyāḥ*, are those souls nearest to the Godhead whose love of me is completed by the still wider and greatest perfection of which I have just shown to you the way and the process. These are the bhaktas who make the Purushottama their one supreme aim and follow out with a perfect faith and exactitude the immortalising Dharma described in this teaching. Dharma in the language of the Gita means the innate law of the being and its works and an action proceeding from and determined by the inner nature, *svabhāva-niyatam karma*. In the lower ignorant consciousness of mind, life and body there are many dharmas, many rules, many standards and laws because there are many varying determinations and types

of the mental, vital and physical nature. The immortal Dharma is one; it is that of the highest spiritual divine consciousness and its powers, *parā prakṛtiḥ*. It is beyond the three gunas, and to reach it all these lower dharmas have to be abandoned, *sarva-dharmān parityajya*. Alone in their place the one liberating unifying consciousness and power of the Eternal has to become the infinite source of our action, its mould, determinant and exemplar. To rise out of our lower personal egoism, to enter into the impersonal and equal calm of the immutable eternal all-pervading Akshara Purusha, to aspire from that calm by a perfect self-surrender of all one's nature and existence to that which is other and higher than the Akshara, is the first necessity of this Yoga. In the strength of that aspiration one can rise to the immortal Dharma. There, made one in being, consciousness and divine bliss with the greatest Uttama Purusha, made one with his supreme dynamic nature-force, *svā prakṛtiḥ*, the liberated spirit can know infinitely, love illimitably, act unfalteringly in the authentic power of a highest immortality and a perfect freedom. The rest of the Gita is written to throw a fuller light on this immortal Dharma.

PART II
THE SUPREME SECRET

XIII

The Field and its Knower¹

THE GITA in its last six chapters, in order to found on a clear and complete knowledge the way of the soul's rising out of the lower into the divine nature, restates in another form the enlightenment the Teacher has already imparted to Arjuna. Essentially it is the same knowledge, but details and relations are now made prominent and assigned their entire significance, thoughts and truths brought out in their full value that were alluded to only in passing or generally stated in the light of another purpose. Thus in the first six chapters the knowledge necessary for the distinction between the immutable self and the soul veiled in nature was accorded an entire prominence. The references to the supreme Self and Purusha were summary and not at all explicit; it was assumed in order to justify works in the world and it was affirmed to be the Master of being, but there was otherwise nothing to show what it was and its relations to the rest were not even hinted at, much less developed. The remaining chapters are devoted to the bringing out of this suppressed knowledge in a conspicuous light and strong pre-eminence. It is to the Lord, the Ishwara, it is to the distinction of the higher and the lower nature and to the vision of the all-originating and all-constituting Godhead in Nature, it is to the One in all beings that prominence has been assigned in the next six Adhyayas (7-12) in order to found a root-unity of works and love with knowledge. But now it is necessary to bring out more definitely the precise relations between the supreme Purusha, the immutable self, the Jiva and Prakriti in her action and her gunas. Arjuna is therefore made to put a question which shall evoke a clearer elucidation of these still ill-lighted matters. He asks to learn of the Purusha and the Prakriti; he inquires of the

¹ Gita, XIII.

field of being and the knower of the field and of knowledge and the object of knowledge. Here is contained the sum of all the knowledge of self and the world that is still needed if the soul is to throw off its natural ignorance and staying its steps on a right use of knowledge, of life, of works and of its own relations with the Divine in these things ascend into unity of being with the eternal Spirit of existence.

The essence of the Gita's ideas in these matters has already, anticipating the final evolution of its thought, been elucidated in a certain measure; but, following its example, we may state them again from the point of view of its present preoccupation. Action being admitted, a divine action done with self-knowledge as the instrument of the divine Will in the cosmos being accepted as perfectly consistent with the Brahmic status and an indispensable part of the Godward movement, that action being uplifted inwardly as a sacrifice with adoration to the Highest, how does this way practically affect the great object of spiritual life, the rising from the lower into the higher nature, from mortal into immortal being? All life, all works are a transaction between the soul and Nature. What is the original character of that transaction? what does it become at its spiritual culminating point? to what perfection does it lead the soul that gets free from its lower and external motives and grows inwardly into the very highest poise of the Spirit and deepest motive-force of the works of its energy in the universe? These are the questions involved, — there are others which the Gita does not raise or answer, for they were not pressingly present to the human mind of that day, — and they are replied to in the sense of the solution drawn from a large-sighted combination of the Vedantic, Sankhya and Yoga views of existence which is the starting-point of the whole thought of the Gita.

The Soul which finds itself here embodied in Nature has a triple reality to its own self-experience. First it is a spiritual being apparently subjected by ignorance to the outward workings of Prakriti and represented in her mobility as an acting, thinking, mutable personality, a creature of Nature, an ego. Next when it gets behind all this action and motion, it finds its own higher

reality to be an eternal and impersonal self and immutable spirit which has no other share in the action and movement than to support it by its presence and regard it as an undisturbed equal witness. And last, when it looks beyond these two opposite selves, it discovers a greater ineffable Reality from which both proceed, the Eternal who is Self of the self and the Master of all Nature and all action, and not only the Master, but the origin and the spiritual support and scene of these workings of his own energy in Cosmos, and not only the origin and spiritual container, but the spiritual inhabitant in all forces, in all things and in all beings, and not only the inhabitant but, by the developments of this eternal energy of his being which we call Nature, himself all energies and forces, all things and all beings. This Nature itself is of two kinds, one derived and inferior, another original and supreme. There is a lower nature of the cosmic mechanism by association with which the soul in Prakriti lives in a certain ignorance born of Maya, *traiguruyamayī māyā*, conceives of itself as an ego of embodied mind and life, works under the power of the modes of Nature, thinks itself bound, suffering, limited by personality, chained to the obligation of birth and the wheel of action, a thing of desires, transient, mortal, a slave of its own nature. Above this inferior power of existence there is a higher divine and spiritual nature of its own true being in which this soul is for ever a conscious portion of the Eternal and Divine, blissful, free, superior to its mask of becoming, immortal, imperishable, a power of the Godhead. To rise by this higher nature to the Eternal through divine knowledge, love and works founded on a spiritual universality is the key of the complete spiritual liberation. This much has been made clear; and we have to see now more in detail what farther considerations this change of being involves and especially what is the difference between these two natures and how our action and our soul-status are affected by the liberation. For that purpose the Gita enters largely into certain details of the highest knowledge which it had hitherto kept in the background. Especially it dwells on the relation between Being and becoming, Soul and Nature, the action of the three gunas, the highest liberation, the largest fullest self-giving

of the human soul to the Divine Spirit. There is in all that it says in these closing six chapters much of the greatest importance, but it is the last thought with which it closes that is of supreme interest; for in it we shall find the central idea of its teaching, its great word to the soul of man, its highest message.

First, the whole of existence must be regarded as a field of the soul's construction and action in the midst of Nature. The Gita explains the *kṣetram*, field, by saying that it is this body which is called the field of the spirit, and in this body there is someone who takes cognizance of the field, *kṣetrajña*, the knower of Nature. It is evident, however, from the definitions that succeed that it is not the physical body alone which is the field, but all too that the body supports, the working of nature, the mentality, the natural action of the objectivity and subjectivity of our being.² This wider body too is only the individual field; there is a larger, a universal, a world-body, a world-field of the same Knower. For in each embodied creature there is this one Knower: in each existence he uses mainly and centrally this single outward result of the power of his nature which he has formed for his habitation, *īśā vāsyam sarvam yat kiñca*, makes each separate sustained knot of his mobile Energy the first base and scope of his developing harmonies. In Nature he knows the world as it affects and is reflected by the consciousness in this one limited body; the world exists to us as it is seen in our single mind,—and in the end, even, this seemingly small embodied consciousness can so enlarge itself that it contains in itself the whole universe, *ātmani viśva-darśanam*. But, physically, it is a microcosm in a macrocosm, and the macrocosm too, the large world too, is a body and field inhabited by the spiritual knower.

That becomes evident when the Gita proceeds to state the character, nature, source, deformations, powers of this sensible embodiment of our being. We see then that it is the whole working of the lower Prakṛiti that is meant by the *kṣetra*. That totality is the field of action of the embodied spirit here within us, the

² The Upanishad speaks of a fivefold body or sheath of Nature, a physical, vital, mental, ideal and divine body; this may be regarded as the totality of the field, *kṣetram*.

field of which it takes cognizance. For a varied and detailed knowledge of all this world of Nature in its essential action as seen from the spiritual view-point we are referred to the verses of the ancient seers, the seers of the Veda and Upanishads, in which we get the inspired and intuitive account of these creations of the Spirit, and to the Brahma Sutras which will give us the rational and philosophic analysis. The Gita contents itself with a brief practical statement of the lower nature of our being in the terms of the Sankhya thinkers. First there is the indiscriminate unmanifest Energy; out of that has come the objective evolution of the five elemental states of matter; as also the subjective evolution of the senses, intelligence and ego; there are too five objects of the senses, or rather five different ways of sense cognizance of the world, powers evolved by the universal energy in order to deal with all the forms of things she has created from the five elemental states assumed by her original objective substance,— organic relations by which the ego endowed with intelligence and sense acts on the formations of the cosmos: this is the constitution of the kshetra. Then there is a general consciousness that first informs and then illumines the Energy in its works; there is a faculty of that consciousness by which the Energy holds together the relations of objects; there is too a continuity, a persistence of the subjective and objective relations of our consciousness with its objects. These are the necessary powers of the field; all these are common and universal powers at once of the mental, vital and physical Nature. Pleasure and pain, liking and disliking are the principal deformations of the kshetra. From the Vedantic point of view we may say that pleasure and pain are the vital or sensational deformations given by the lower energy to the spontaneous Ananda or delight of the spirit when brought into contact with her workings. And we may say from the same view-point that liking and disliking are the corresponding mental deformations given by her to the reactive Will of the spirit that determines its response to her contacts. These dualities are the positive and negative terms in which the ego soul of the lower nature enjoys the universe. The negative terms, pain, dislike, sorrow, repulsion and the rest, are

perverse or at the best ignorantly reverse responses: the positive terms, liking, pleasure, joy, attraction, are ill-guided responses or at the best insufficient and in character inferior to those of the true spiritual experience.

All these things taken together constitute the fundamental character of our first transactions with the world of Nature, but it is evidently not the whole description of our being; it is our actuality but not the limit of our possibilities. There is something beyond to be known, *jñeyam*, and it is when the knower of the field turns from the field itself to learn of himself within it and of all that is behind its appearances that real knowledge begins, *jñānam*, — the true knowledge of the field no less than of the knower. That turning inward alone delivers from ignorance. For the farther we go inward, the more we seize on greater and fuller realities of things and grasp the complete truth both of God and the soul and of the world and its movements. Therefore, says the divine Teacher, it is the knowledge at once of the field and its knower, *kṣetra-kṣetrajñayor jñānam*, a united and even unified self-knowledge and world-knowledge, which is the real illumination and the only wisdom. For both soul and nature are the Brahman, but the true truth of the world of Nature can only be discovered by the liberated sage who possesses also the truth of the spirit. One Brahman, one reality in Self and Nature is the object of all knowledge.

The Gita then tells us what is the spiritual knowledge or rather it tells us what are the conditions of knowledge, the marks, the signs of the man whose soul is turned towards the inner wisdom. These signs are the recognised and traditional characteristics of the sage,— his strong turning away of the heart from attachment to outward and worldly things, his inward and brooding spirit, his steady mind and calm equality, the settled fixity of his thought and will upon the greatest inmost truths, upon the things that are real and eternal. First, there comes a certain moral condition, a sattwic government of the natural being. There is fixed in him a total absence of worldly pride and arrogance, a candid soul, a tolerant, long-suffering and benignant heart, purity of mind and body, tranquil firmness

and steadfastness, self-control and a masterful government of the lower nature and the heart's worship given to the Teacher, whether to the divine Teacher within or to the human Master in whom the divine Wisdom is embodied,— for that is the sense of the reverence given to the Guru. Then there is a nobler and freer attitude towards the outward world, an attitude of perfect detachment and equality, a firm removal of the natural being's attraction to the objects of the senses and a radical freedom from the claims of that constant clamorous ego-sense, ego-idea, ego-motive which tyrannises over the normal man. There is no longer any clinging to the attachment and absorption of family and home. There is instead of these vital and animal movements an unattached will and sense and intelligence, a keen perception of the defective nature of the ordinary life of physical man with its aimless and painful subjection to birth and death and disease and age, a constant equalness to all pleasant or unpleasant happenings,— for the soul is seated within and impervious to the shocks of external events,— and a meditative mind turned towards solitude and away from the vain noise of crowds and the assemblies of men. Finally, there is a strong turn within towards the things that really matter, a philosophic perception of the true sense and large principles of existence, a tranquil continuity of inner spiritual knowledge and light, the Yoga of an unswerving devotion, love of God, the heart's deep and constant adoration of the universal and eternal Presence.

The one object to which the mind of spiritual knowledge must be turned is the Eternal by fixity in whom the soul clouded here and swathed in the mists of Nature recovers and enjoys its native and original consciousness of immortality and transcendence. To be fixed on the transient, to be limited in the phenomenon is to accept mortality; the constant truth in things that perish is that in them which is inward and immutable. The soul when it allows itself to be tyrannised over by the appearances of Nature, misses itself and goes whirling about in the cycle of the births and deaths of its bodies. There, passionately following without end the mutations of personality and its interests, it cannot draw back to the possession of its

impersonal and unborn self-existence. To be able to do that is to find oneself and get back to one's true being, that which assumes these births but does not perish with the perishing of its forms. To enjoy the eternity to which birth and life are only outward circumstances, is the soul's true immortality and transcendence. That Eternal or that Eternity is the Brahman. Brahman is That which is transcendent and That which is universal: it is the free spirit who supports in front the play of soul with nature and assures behind their imperishable oneness; it is at once the mutable and the immutable, the All that is the One. In his highest supracosmic status Brahman is a transcendent Eternity without origin or change far above the phenomenal oppositions of existence and non-existence, persistence and transience between which the outward world moves. But once seen in the substance and light of this eternity, the world also becomes other than it seems to the mind and senses; for then we see the universe no longer as a whirl of mind and life and matter or a mass of the determinations of energy and substance, but as no other than this eternal Brahman. A spirit who immeasurably fills and surrounds all this movement with himself—for indeed the movement too is himself—and who throws on all that is finite the splendour of his garment of infinity, a bodiless and million-bodied spirit whose hands of strength and feet of swiftness are on every side of us, whose heads and eyes and faces are those innumerable visages which we see wherever we turn, whose ear is everywhere listening to the silence of eternity and the music of the worlds, is the universal Being in whose embrace we live.

All relations of Soul and Nature are circumstances in the eternity of Brahman; sense and quality, their reflectors and constituents, are this supreme Soul's devices for the presentation of the workings that his own energy in things constantly liberates into movement. He is himself beyond the limitation of the senses, sees all things but not with the physical eye, hears all things but not with the physical ear, is aware of all things but not with the limiting mind—mind which represents but cannot truly know. Not determined by any qualities, he possesses and determines in his substance all qualities and enjoys this qualitative action of

his own Nature. He is attached to nothing, bound by nothing, fixed to nothing that he does; calm, he supports in a large and immortal freedom all the action and movement and passion of his universal Shakti. He becomes all that is in the universe; that which is in us is he and all that we experience outside ourselves is he. The inward and the outward, the far and the near, the moving and the unmoving, all this he is at once. He is the subtlety of the subtle which is beyond our knowledge, even as he is the density of force and substance which offers itself to the grasp of our minds. He is indivisible and the One, but seems to divide himself in forms and creatures and appears as all these separate existences. All things can get back in him, can return in the Spirit to the indivisible unity of their self-existence. All is eternally born from him, upborne in his eternity, taken eternally back into his oneness. He is the light of all lights and luminous beyond all the darkness of our ignorance. He is knowledge and the object of knowledge. The spiritual supramental knowledge that floods the illumined mind and transfigures it is this spirit manifesting himself in light to the force-obscured soul which he has put forth into the action of Nature. This eternal Light is in the heart of every being; it is he who is the secret knower of the field, *kṣetrajña*, and presides as the Lord in the heart of things over this province and over all these kingdoms of his manifested becoming and action. When man sees this eternal and universal Godhead within himself, when he becomes aware of the soul in all things and discovers the spirit in Nature, when he feels all the universe as a wave mounting in this Eternity and all that is as the one existence, he puts on the light of Godhead and stands free in the midst of the worlds of Nature. A divine knowledge and a perfect turning with adoration to this Divine is the secret of the great spiritual liberation. Freedom, love and spiritual knowledge raise us from mortal nature to immortal being.

The Soul and Nature are only two aspects of the eternal Brahman, an apparent duality which founds the operations of his universal existence. The Soul is without origin and eternal, Nature too is without origin and eternal; but the modes of Nature and the lower forms she assumes to our conscious

experience have an origin in the transactions of these two entities. They come from her, wear by her the outward chain of cause and effect, doing and the results of doing, force and its workings, all that is here transient and mutable. Constantly they change and the soul and Nature seem to change with them, but in themselves these two powers are eternal and always the same. Nature creates and acts, the Soul enjoys her creation and action; but in this inferior form of her action she turns this enjoyment into the obscure and petty figures of pain and pleasure. Forcibly the soul, the individual Purusha, is attracted by her qualitative workings and this attraction of her qualities draws him constantly to births of all kinds in which he enjoys the variations and vicissitudes, the good and evil of birth in Nature. But this is only the outward experience of the soul mutable in conception by identification with mutable Nature. Seated in this body is her and our Divinity, the supreme Self, Paramatman, the supreme Soul, the mighty Lord of Nature, who watches her action, sanctions her operations, upholds all she does, commands her manifold creation, enjoys with his universal delight this play of her figures of his own being. That is the self-knowledge to which we have to accustom our mentality before we can truly know ourselves as an eternal portion of the Eternal. Once that is fixed, no matter how the soul in us may comport itself outwardly in its transactions with Nature, whatever it may seem to do or however it may seem to assume this or that figure of personality and active force and embodied ego, it is in itself free, no longer bound to birth because one through impersonality of self with the inner unborn spirit of existence. That impersonality is our union with the supreme egoless I of all that is in cosmos.

This knowledge comes by an inner meditation through which the eternal self becomes apparent to us in our own self-existence. Or it comes by the Yoga of the Sankhyas, the separation of the soul from nature. Or it comes by the Yoga of works in which the personal will is dissolved through the opening up of our mind and heart and all our active forces to the Lord who assumes to himself the whole of our works in nature. The spiritual knowledge may be awakened by the

urging of the spirit within us, its call to this or that Yoga, this or that way of oneness. Or it may come to us by hearing of the truth from others and the moulding of the mind into the sense of that to which it listens with faith and concentration. But however arrived at, it carries us beyond death to immortality. Knowledge shows us high above the mutable transactions of the soul with the mortality of nature our highest Self as the supreme Lord of her actions, one and equal in all objects and creatures, not born in the taking up of a body, not subject to death in the perishing of all these bodies. That is the true seeing, the seeing of that in us which is eternal and immortal. As we perceive more and more this equal spirit in all things, we pass into that equality of the spirit; as we dwell more and more in this universal being, we become ourselves universal beings; as we grow more and more aware of this eternal, we put on our own eternity and are for ever. We identify ourselves with the eternity of the self and no longer with the limitation and distress of our mental and physical ignorance. Then we see that all our works are an evolution and operation of Nature and our real self not the executive doer, but the free witness and lord and unattached enjoyer of the action. All this surface of cosmic movement is a diverse becoming of natural existences in the one eternal Being, all is extended, manifested, rolled out by the universal Energy from the seeds of her Idea deep in his existence; but the spirit even though it takes up and enjoys her workings in this body of ours, is not affected by its mortality because it is eternal beyond birth and death, is not limited by the personalities which it multiply assumes in her because it is the one supreme self of all these personalities, is not changed by the mutations of quality because it is itself undetermined by quality, does not act even in action, *kartāram api akartāram*, because it supports natural action in a perfect spiritual freedom from its effects, is the originator indeed of all activities, but in no way changed or affected by the play of its Nature. As the all-pervading ether is not affected or changed by the multiple forms it assumes, but remains always the same pure subtle original substance, even so this spirit when it has done and become all

possible things, remains through it all the same pure immutable subtle infinite essence. That is the supreme status of the soul, *parā gatiḥ*, that is the divine being and nature, *madbhāva*, and whoever arrives at spiritual knowledge, rises to that supreme immortality of the Eternal.

This Brahman, this eternal and spiritual knower of the field of his own natural becoming, this Nature, his perpetual energy, which converts herself into that field, this immortality of the soul in mortal nature,—these things together make the whole reality of our existence. The spirit within, when we turn to it, illuminates the entire field of Nature with its own truth in all the splendour of its rays. In the light of that sun of knowledge the eye of knowledge opens in us and we live in that truth and no longer in this ignorance. Then we perceive that our limitation to our present mental and physical nature was an error of the darkness, then we are liberated from the law of the lower Prakriti, the law of the mind and body, then we attain to the supreme nature of the spirit. That splendid and lofty change is the last, the divine and infinite becoming, the putting off of mortal nature, the putting on of an immortal existence.

XIV

Above the Gunas¹

THE DISTINCTIONS between the Soul and Nature rapidly drawn in the verses of the thirteenth chapter by a few decisive epithets, a few brief but packed characterisations of their separate power and functioning, and especially the distinction between the embodied soul subjected to the action of Nature by its enjoyment of her gunas, qualities or modes and the Supreme Soul which dwells enjoying the gunas, but not subject because it is itself beyond them, are the basis on which the Gita rests its whole idea of the liberated being made one in the conscious law of its existence with the Divine. That liberation, that oneness, that putting on of the divine nature, *sādharmya*, it declares to be the very essence of spiritual freedom and the whole significance of immortality. This supreme importance assigned to *sādharmya* is a capital point in the teaching of the Gita.

To be immortal was never held in the ancient spiritual teaching to consist merely in a personal survival of the death of the body: all beings are immortal in that sense and it is only the forms that perish. The souls that do not arrive at liberation, live through the returning aeons; all exist involved or secret in the Brahman during the dissolution of the manifest worlds and are born again in the appearance of a new cycle. Pralaya, the end of a cycle of aeons, is the temporary disintegration of a universal form of existence and of all the individual forms which move in its rounds, but that is only a momentary pause, a silent interval followed by an outburst of new creation, reintegration and reconstruction in which they reappear and recover the impetus of their progression. Our physical death is also a pralaya,—the Gita will presently use the word in the sense of this death,

¹ Gita, XIV.

pralayam yāti deha-bhṛt, “the soul bearing the body comes to a pralaya,” to a disintegration of that form of matter with which its ignorance identified its being and which now dissolves into the natural elements. But the soul itself persists and after an interval resumes in a new body formed from those elements its round of births in the cycle, just as after the interval of pause and cessation the universal Being resumes his endless round of the cyclic aeons. This immortality in the rounds of Time is common to all embodied spirits.

To be immortal in the deeper sense is something different from this survival of death and this constant recurrence. Immortality is that supreme status in which the Spirit knows itself to be superior to death and birth, not conditioned by the nature of its manifestation, infinite, imperishable, immutably eternal, — immortal, because never being born it never dies. The divine Purushottama, who is the supreme Lord and supreme Brahman, possesses for ever this immortal eternity and is not affected by his taking up a body or by his continuous assumption of cosmic forms and powers because he exists always in this self-knowledge. His very nature is to be unchangeably conscious of his own eternity; he is self-aware without end or beginning. He is here the Inhabitant of all bodies, but as the unborn in every body, not limited in his consciousness by that manifestation, not identified with the physical nature which he assumes; for that is only a minor circumstance of his universal activised play of existence. Liberation, immortality is to live in this unchangeably conscious eternal being of the Purushottama.² But to arrive here at this greater spiritual immortality the embodied soul must cease to live according to the law of the lower nature; it must

² Mark that nowhere in the Gita is there any indication that dissolution of the individual spiritual being into the unmanifest, indefinable or absolute Brahman, *avyaktam anirdeśyam*, is the true meaning or condition of immortality or the true aim of Yoga. On the contrary it describes immortality later on as an indwelling in the Ishwara in his supreme status, *mayi nivasiṣyasi, parāṁ dhāma*, and here as *sādharmya, parāṁ siddhim*, a supreme perfection, a becoming of one law of being and nature with the Supreme, persistent still in existence and conscious of the universal movement but above it, as all the sages still exist, *munayah sarve*, not bound to birth in the creation, not troubled by the dissolution of the cycles.

put on the law of the Divine's supreme way of existence which is in fact the real law of its own eternal essence. In the spiritual evolution of its becoming, no less than in its secret original being, it must grow into the likeness of the Divine.

And this great thing, to rise from the human into the divine nature, we can only do by an effort of Godward knowledge, will and adoration. For the soul sent forth by the Supreme as his eternal portion, his immortal representative into the workings of universal Nature is yet obliged by the character of those workings, *avaśam prakṛter vaśat*, to identify itself in its external consciousness with her limiting conditions, to identify itself with a life, mind and body that are oblivious of their inner spiritual reality and of the innate Godhead. To get back to self-knowledge and to the knowledge of the real as distinct from the apparent relations of the soul with Nature, to know God and ourselves and the world with a spiritual and no longer with a physical or externalised experience, through the deepest truth of the inner soul-consciousness and not through the misleading phenomenal significances of the sense-mind and the outward understanding, is an indispensable means of this perfection. Perfection cannot come without self-knowledge and God-knowledge and a spiritual attitude towards our natural existence, and that is why the ancient wisdom laid so much stress on salvation by knowledge, — not an intellectual cognizance of things, but a growing of man the mental being into a greater spiritual consciousness. The soul's salvation cannot come without the soul's perfection, without its growing into the divine nature; the impartial Godhead will not effect it for us by an act of caprice or an arbitrary *sanad* of his favour. Divine works are effective for salvation because they lead us towards this perfection and to a knowledge of self and nature and God by a growing unity with the inner Master of our existence. Divine love is effective because by it we grow into the likeness of the sole and supreme object of our adoration and call down the answering love of the Highest to flood us with the light of his knowledge and the uplifting power and purity of his eternal spirit. Therefore, says the Gita, this is the supreme knowledge and the highest of all knowings because it leads to

the highest perfection and spiritual status, *parām siddhim*, and brings the soul to likeness with the Divine, *sādharmya*. It is the eternal wisdom, the great spiritual experience by which all the sages attained to that highest perfection, grew into one law of being with the Supreme and live for ever in his eternity, not born in the creation, not troubled by the anguish of the universal dissolution. This perfection, then, this *sādharmya* is the way of immortality and the indispensable condition without which the soul cannot consciously live in the Eternal.

The soul of man could not grow into the likeness of the Divine, if it were not in its secret essence imperishably one with the Divine and part and parcel of his divinity: it could not be or become immortal if it were merely a creature of mental, vital and physical Nature. All existence is a manifestation of the divine Existence and that which is within us is spirit of the eternal Spirit. We have come indeed into the lower material nature and are under its influence, but we have come there from the supreme spiritual nature: this inferior imperfect status is our apparent, but that our real being. The Eternal puts all this movement forth as his self-creation. He is at once the Father and Mother of the universe; the substance of the infinite Idea, *vijñāna*, the Mahad Brahman, is the womb into which he casts the seed of his self-conception. As the Over-Soul he casts the seed; as the Mother, the Nature-Soul, the Energy filled with his conscious power, he receives it into this infinite substance of being made pregnant with his illimitable, yet self-limiting Idea. He receives into this Vast of self-conception and develops there the divine embryo into mental and physical form of existence born from the original act of conceptional creation. All we see springs from that act of creation; but that which is born here is only finite idea and form of the unborn and infinite. The Spirit is eternal and superior to all its manifestation: Nature, eternal without beginning in the Spirit, proceeds for ever with the rhythm of the cycles by unending act of creation and unconcluding act of cessation; the Soul too which takes on this or that form in Nature, is no less eternal than she, *anādī ubhāv api*. Even while in Nature it follows the unceasing round of the cycles, it is, in the Eternal

from which it proceeds into them, for ever raised above the terms of birth and death, and even in its apparent consciousness here it can become aware of that innate and constant transcendence.

What is it then that makes the difference, what is it that gets the soul into the appearance of birth and death and bondage,—for this is patent that it is only an appearance? It is a subordinate act or state of consciousness, it is a self-oblivious identification with the modes of Nature in the limited workings of this lower motivity and with this self-wrapped ego-bounded knot of action of the mind, life and body. To rise above the modes of Nature, to be *traigunyātīta*, is indispensable, if we are to get back into our fully conscious being away from the obsessing power of the lower action and to put on the free nature of the spirit and its eternal immortality. That condition of the *sādharmya* is what the Gita next proceeds to develop. It has already alluded to it and laid it down with a brief emphasis in a previous chapter; but it has now to indicate more precisely what are these modes, these gunas, how they bind the soul and keep it back from spiritual freedom and what is meant by rising above the modes of Nature.

The modes of Nature are all qualitative in their essence and are called for that reason its gunas or qualities. In any spiritual conception of the universe this must be so, because the connecting medium between spirit and matter must be psyche or soul power and the primary action psychological and qualitative, not physical and quantitative; for quality is the immaterial, the more spiritual element in all the action of the universal Energy, her prior dynamics. The predominance of physical Science has accustomed us to a different view of Nature, because there the first thing that strikes us is the importance of the quantitative aspect of her workings and her dependence for the creation of forms on quantitative combinations and dispositions. And yet even there the discovery that matter is rather substance or act of energy than energy a motive power of self-existent material substance or an inherent power acting in matter has led to some revival of an older reading of universal Nature. The analysis of the ancient Indian thinkers allowed for the quantitative action of Nature, *mātrā*; but that it regarded as proper to its more objective and

formally executive working, while the innately ideative executive power which disposes things according to the quality of their being and energy, *guna, svabhāva*, is the primary determinant and underlies all the outer quantitative dispositions. In the basis of the physical world this is not apparent only because there the underlying ideative spirit, the Mahad Brahman, is overlaid and hidden up by the movement of matter and material energy. But even in the physical world the miraculous varying results of different combinations and quantities of elements otherwise identical with each other admits of no conceivable explanation if there is not a superior power of variative quality of which these material dispositions are only the convenient mechanical devices. Or let us say at once, there must be a secret ideative capacity of the universal energy, *vijñāna*,—even if we suppose that energy and its instrumental idea, *buddhi*, to be themselves mechanical in their nature,—which fixes the mathematics and decides the resultants of these outer dispositions: it is the omnipotent Idea in the spirit which invents and makes use of these devices. And in the vital and mental existence quality at once openly appears as the primary power and amount of energy is only a secondary factor. But in fact the mental, the vital, the physical existence are all subject to the limitations of quality, all are governed by its determinations, even though that truth seems more and more obscured as we descend the scale of existence. Only the Spirit, which by the power of its idea-being and its idea-force called *mahat* and *vijñāna* fixes these conditions, is not so determined, not subject to any limitations either of quality or quantity because its immeasurable and indeterminable infinity is superior to the modes which it develops and uses for its creation.

But, again, the whole qualitative action of Nature, so infinitely intricate in its detail and variety, is figured as cast into the mould of three general modes of quality everywhere present, intertwined, almost inextricable, *sattva, rajas, tamas*. These modes are described in the Gita only by their psychological action in man, or incidentally in things such as food according as they produce a psychological or vital effect on human beings. If we look for a more general definition, we shall perhaps catch a

glimpse of it in the symbolic idea of Indian religion which attributes each of these qualities respectively to one member of the cosmic Trinity, sattwa to the preserver Vishnu, rajas to the creator Brahma, tamas to the destroyer Rudra. Looking behind this idea for the rationale of the triple ascription, we might define the three modes or qualities in terms of the motion of the universal Energy as Nature's three concomitant and inseparable powers of equilibrium, kinesis and inertia. But that is only their appearance in terms of the external action of Force. It is otherwise if we regard consciousness and force as twin terms of the one Existence, always coexistent in the reality of being, however in the primal outward phenomenon of material Nature light of consciousness may seem to disappear in a vast action of nescient unillumined energy, while at an opposite pole of spiritual quiescence action of force may seem to disappear in the stillness of the observing or witness consciousness. These two conditions are the two extremes of an apparently separated Purusha and Prakriti, but each at its extreme point does not abolish but at the most only conceals its eternal mate in the depths of its own characteristic way of being. Therefore, since consciousness is always there even in an apparently inconscient Force, we must find a corresponding psychological power of these three modes which informs their more outward executive action. On their psychological side the three qualities may be defined, tamas as Nature's power of nescience, rajas as her power of active seeking ignorance enlightened by desire and impulsion, sattwa as her power of possessing and harmonising knowledge.

The three qualitative modes of Nature are inextricably intertwined in all cosmic existence. Tamas, the principle of inertia, is a passive and inert nescience which suffers all shocks and contacts without any effort of mastering response and by itself would lead to a disintegration of the whole action of the energy and a radical dispersion of substance. But it is driven by the kinetic power of rajas and even in the nescience of Matter is met and embraced by an innate though unpossessed preserving principle of harmony and balance and knowledge. Material energy appears to be tamasic in its basic action, *jada*, nescient,

mechanic and in movement disintegrative. But it is dominated by a huge force and impulsion of mute rajasic kinesis which drives it, even in and even by its dispersion and disintegration, to build and create and again by a sattvic ideative element in its apparently inconscient force which is always imposing a harmony and preservative order on the two opposite tendencies. Rajas, the principle of creative endeavour and motion and impulsion in Prakriti, kinesis, *pravṛtti*, so seen in Matter, appears more evidently as a conscious or half-conscious passion of seeking and desire and action in the dominant character of Life,—for that passion is the nature of all vital existence. And it would lead by itself in its own nature to a persistent but always mutable and unstable life and activity and creation without any settled result. But met on one side by the disintegrating power of tamas with death and decay and inertia, its ignorant action is on the other side of its functioning settled and harmonised and sustained by the power of sattwa, subconscious in the lower forms of life, more and more conscious in the emergence of mentality, most conscious in the effort of the evolved intelligence figuring as will and reason in the fully developed mental being. Sattwa, the principle of understanding knowledge and of according assimilation, measure and equilibrium, which by itself would lead only to some lasting concord of fixed and luminous harmonies, is in the motions of this world impelled to follow the mutable strife and action of the eternal kinesis and constantly overpowered or hedged in by the forces of inertia and nescience. This is the appearance of a world governed by the interlocked and mutually limited play of the three qualitative modes of Nature.

The Gita applies this generalised analysis of the universal Energy to the psychological nature of man in relation to his bondage to Prakriti and the realisation of spiritual freedom. Sattwa, it tells us, is by the purity of its quality a cause of light and illumination and by virtue of that purity it produces no disease or morbidity or suffering in the nature. When into all the doors in the body there comes a flooding of light, as if the doors and windows of a closed house were opened to sunshine, a light of understanding, perception and knowledge,

—when the intelligence is alert and illumined, the senses quickened, the whole mentality satisfied and full of brightness and the nervous being calmed and filled with an illumined ease and clarity, *prasāda*, one should understand that there has been a great increase and uprising of the sattwic guna in the nature. For knowledge and a harmonious ease and pleasure and happiness are the characteristic results of sattwa. The pleasure that is sattwic is not only that contentment which an inner clarity of satisfied will and intelligence brings with it, but all delight and content produced by the soul's possession of itself in light or by an accord or an adequate and truthful adjustment between the regarding soul and the surrounding Nature and her offered objects of desire and perception.

Rajas, again, the Gita tells us, has for its essence attraction of liking and longing. Rajas is a child of the attachment of the soul to the desire of objects; it is born from the nature's thirst for an unpossessed satisfaction. It is therefore full of unrest and fever and lust and greed and excitement, a thing of seeking impulsions, and all this mounts in us when the middle guna increases. It is the force of desire which motives all ordinary personal initiative of action and all that movement of stir and seeking and propulsion in our nature which is the impetus towards action and works, *pravṛtti*. Rajas, then, is evidently the kinetic force in the modes of Nature. Its fruit is the lust of action, but also grief, pain, all kinds of suffering; for it has no right possession of its object—desire in fact implies non-possession—and even its pleasure of acquired possession is troubled and unstable because it has not clear knowledge and does not know how to possess nor can it find the secret of accord and right enjoyment. All the ignorant and passionate seeking of life belongs to the rajasic mode of Nature.

Tamas, finally, is born of inertia and ignorance and its fruit too is inertia and ignorance. It is the darkness of tamas which obscures knowledge and causes all confusion and delusion. Therefore it is the opposite of sattwa, for the essence of sattwa is enlightenment, *prakāśa*, and the essence of tamas is absence of light, nescience, *aprakāśa*. But tamas brings incapacity and

negligence of action as well as the incapacity and negligence of error, inattention and misunderstanding or non-understanding; indolence, languor and sleep belong to this guna. Therefore it is the opposite too of rajas; for the essence of rajas is movement and impulsion and kinesis, *pravrtti*, but the essence of tamas is inertia, *apravrtti*. Tamas is inertia of nescience and inertia of inaction, a double negative.

These three qualities of Nature are evidently present and active in all human beings and none can be said to be quite devoid of one and another or free from any one of the three; none is cast in the mould of one guna to the exclusion of the others. All men have in them in whatever degree the rajasic impulse of desire and activity and the sattwic boon of light and happiness, some balance, some adjustment of mind to itself and its surroundings and objects, and all have their share of tamasic incapacity and ignorance or nescience. But these qualities are not constant in any man in the quantitative action of their force or in the combination of their elements; for they are variable and in a continual state of mutual impact, displacement and interaction. Now one leads, now another increases and predominates, and each subjects us to its characteristic action and consequences. Only by a general and ordinary predominance of one or other of the qualities can a man be said to be either sattwic or rajasic or tamasic in his nature; but this can only be a general and not an exclusive or absolute description. The three qualities are a triple power which by their interaction determine the character and disposition and through that and its various motions the actions of the natural man. But this triple power is at the same time a triple cord of bondage. "The three gunas born of Prakriti" says the Gita "bind in the body the imperishable dweller in the body." In a certain sense we can see at once that there must be this bondage in following the action of the gunas; for they are all limited by their finite of quality and operation and cause limitation. Tamas is on both its sides an incapacity and therefore very obviously binds to limitation. Rajasic desire as an initiator of action is a more positive power, but still we can see well enough that desire with its limiting and engrossing hold on man

must always be a bondage. But how does sattwa, the power of knowledge and happiness, become a chain? It so becomes because it is a principle of mental nature, a principle of limited and limiting knowledge and of a happiness which depends upon right following or attainment of this or that object or else on particular states of the mentality, on a light of mind which can be only a more or less clear twilight. Its pleasure can only be a passing intensity or a qualified ease. Other is the infinite spiritual knowledge and the free self-existent delight of our spiritual being.

But then there is the question, how does our infinite and imperishable spirit, even involved in Nature, come thus to confine itself to the lower action of Prakriti and undergo this bondage and how is it not, like the supreme spirit of which it is a portion, free in its infinity even while enjoying the self-limitations of its active evolution? The reason, says the Gita, is our attachment to the gunas and to the result of their workings. Sattwa, it says, attaches to happiness, rajas attaches to action, tamas covers up the knowledge and attaches to negligence of error and inaction. Or again, "sattwa binds by attachment to knowledge and attachment to happiness, rajas binds the embodied spirit by attachment to works, tamas binds by negligence and indolence and sleep." In other words, the soul by attachment to the enjoyment of the gunas and their results concentrates its consciousness on the lower and outward action of life, mind and body in Nature, imprisons itself in the form of these things and becomes oblivious of its own greater consciousness behind in the spirit, unaware of the free power and scope of the liberating Purusha. Evidently, in order to be liberated and perfect, we must get back from these things, away from the gunas and above them and return to the power of that free spiritual consciousness above Nature.

But this would seem to imply a cessation of all doing, since all natural action is done by the gunas, by Nature through her modes. The soul cannot act by itself, it can only act through Nature and her modes. And yet the Gita, while it demands freedom from the modes, insists upon the necessity of action. Here comes in the importance of its insistence on the abandonment

of the fruits; for it is the desire of the fruits which is the most potent cause of the soul's bondage and by abandoning it the soul can be free in action. Ignorance is the result of tamasic action, pain the consequence of rajasic works, pain of reaction, disappointment, dissatisfaction or transience, and therefore in attachment to the fruits of this kind of activity attended as they are with these undesirable accompaniments there is no profit. But of works rightly done the fruit is pure and sattwic, the inner result is knowledge and happiness. Yet attachment even to these pleasurable things must be entirely abandoned, first, because in the mind they are limited and limiting forms and, secondly, because, since sattwa is constantly entangled with and besieged by rajas and tamas which may at any moment overcome it, there is a perpetual insecurity in their tenure. But, even if one is free from any clinging to the fruit, there may be an attachment to the work itself, either for its own sake, the essential rajasic bond, or owing to a lax subjection to the drive of Nature, the tamasic, or for the sake of the attracting rightness of the thing done, which is the sattwic attaching cause powerful on the virtuous man or the man of knowledge. And here evidently the resource is in that other injunction of the Gita, to give up the action itself to the Lord of works and be only a desireless and equal-minded instrument of his will. To see that the modes of Nature are the whole agency and cause of our works and to know and turn to that which is supreme above the gunas, is the way to rise above the lower nature. Only so can we attain to the movement and status of the Divine, *mad-bhāva*, by which free from subjection to birth and death and their concomitants, decay, old age and suffering, the liberated soul shall enjoy in the end immortality and all that is eternal.

But what, asks Arjuna, are the signs of such a man, what his action and how is he said even in action to be above the three gunas? The sign, says Krishna, is that equality of which I have so constantly spoken; the sign is that inwardly he regards happiness and suffering alike, gold and mud and stone as of equal value and that to him the pleasant and the unpleasant, praise and blame, honour and insult, the faction of his friends

and the faction of his enemies are equal things. He is steadfast in a wise imperturbable and immutable inner calm and quietude. He initiates no action, but leaves all works to be done by the gunas of Nature. Sattwa, rajas or tamas may rise or cease in his outer mentality and his physical movements with their results of enlightenment, of impulsion to works or of inaction and the clouding over of the mental and nervous being, but he does not rejoice when this comes or that ceases, nor on the other hand does he abhor or shrink from the operation or the cessation of these things. He has seated himself in the conscious light of another principle than the nature of the gunas and that greater consciousness remains steadfast in him, above these powers and unshaken by their motions like the sun above clouds to one who has risen into a higher atmosphere. He from that height sees that it is the gunas that are in process of action and that their storm and calm are not himself but only a movement of Prakriti; his self is immovable above and his spirit does not participate in that shifting mutability of things unstable. This is the impersonality of the Brahmic status; for that higher principle, that greater wide high-seated consciousness, *kūṭastha*, is the immutable Brahman.

But still there is evidently here a double status, there is a scission of the being between two opposites; a liberated spirit in the immutable Self or Brahman watches the action of an unliberated mutable Nature,—Akshara and Kshara. Is there no greater status, no principle of more absolute perfection, or is this division the highest consciousness possible in the body, and is the end of Yoga to drop the mutable nature and the gunas born of the embodiment in Nature and disappear into the impersonality and everlasting peace of the Brahman? Is that *laya* or dissolution of the individual Purusha the greatest liberation? There is, it would seem, something else; for the Gita says at the close, always returning to this one final note, "He also who loves and strives after Me with an undeviating love and adoration, passes beyond the three gunas and he too is prepared for becoming the Brahman." This "I" is the Purushottama who is the foundation of the silent Brahman and of immortality and imperishable spiritual existence and of the eternal dharma and

of an utter bliss of happiness. There is a status then which is greater than the peace of the Akshara as it watches unmoved the strife of the gunas. There is a highest spiritual experience and foundation above the immutability of the Brahman, there is an eternal dharma greater than the rajasic impulsion to works, *pravṛtti*, there is an absolute delight which is untouched by rajasic suffering and beyond the sattwic happiness, and these things are found and possessed by dwelling in the being and power of the Purushottama. But since it is acquired by bhakti, its status must be that divine delight, Ananda, in which is experienced the union of utter love³ and possessing oneness, the crown of bhakti. And to rise into that Ananda, into that imperishable oneness must be the completion of spiritual perfection and the fulfilment of the eternal immortalising dharma.

³ *niratiśayapremāspadatvam ānandatattvam.*

XV

The Three Purushas¹

THE DOCTRINE of the Gita from the beginning to the end converges on all its lines and through all the flexibility of its turns towards one central thought, and to that it is arriving in all its balancing and reconciliation of the disagreements of various philosophic systems and its careful synthetising of the truths of spiritual experience, lights often conflicting or at least divergent when taken separately and exclusively pursued along their outer arc and curve of radiation, but here brought together into one focus of grouping vision. This central thought is the idea of a triple consciousness, three and yet one, present in the whole scale of existence.

There is a spirit here at work in the world that is one in innumerable appearances. It is the developer of birth and action, the moving power of life, the inhabiting and associating consciousness in the myriad mutabilities of Nature; it is the constituting reality of all this stir in Time and Space; it is itself Time and Space and Circumstance. It is this multitude of souls in the worlds; it is the gods and men and creatures and things and forces and qualities and quantities and powers and presences. It is Nature, which is power of the Spirit, and objects, which are its phenomena of name and idea and form, and existences, who are portions and births and becomings of this single self-existent spiritual entity, the One, the Eternal. But what we see obviously at work before us is not this Eternal and his conscious Shakti, but a Nature which in the blind stress of her operations is ignorant of the spirit within her action. Her work is a confused, ignorant and limiting play of certain fundamental modes, qualities, principles of force in mechanical operation and the fixity or the flux of their consequences. And whatever soul comes to the

¹ Gita, XV.

surface in her action, is itself in appearance ignorant, suffering, bound to the incomplete and unsatisfying play of this inferior Nature. The inherent Power in her is yet other than what it thus seems to be; for, hidden in its truth, manifest in its appearances, it is the Kshara, the universal Soul, the spirit in the mutability of cosmic phenomenon and becoming, one with the Immutable and the Supreme. We have to arrive at the hidden truth behind its manifest appearances; we have to discover the Spirit behind these veils and to see all as the One, *vāsudevalḥ sarvam iti*, individual, universal, transcendent. But this is a thing impossible to achieve with any completeness of inner reality, so long as we live concentrated in the inferior Nature. For in this lesser movement Nature is an ignorance, a Maya; she shelters the Divine within its folds and conceals him from herself and her creatures. The Godhead is hidden by the Maya of his own all-creating Yoga, the Eternal figured in transience, Being absorbed and covered up by its own manifesting phenomena. In the Kshara taken alone as a thing in itself, the mutable universal apart from the undivided Immutable and the Transcendent, there is no completeness of knowledge, no completeness of our being and therefore no liberation.

But then there is another spirit of whom we become aware and who is none of these things, but self and self only. This Spirit is eternal, always the same, never changed or affected by manifestation, the one, the stable, a self-existence undivided and not even seemingly divided by the division of things and powers in Nature, inactive in her action, immobile in her motion. It is the Self of all and yet unmoved, indifferent, intangible, as if all these things which depend upon it were not-self, not its own results and powers and consequences, but a drama of action developed before the eye of an unmoved unparticipating spectator. For the mind that stages and shares in the drama is other than the Self which indifferently contains the action. This spirit is timeless, though we see it in Time; it is unextended in space, though we see it as if pervading space. We become aware of it in proportion as we draw back from out inward, or look behind the action and motion for something that is eternal and stable, or get away from time and its creation to the uncreated, away from phenomenon

to being, from the personal to impersonality, from becoming to unalterable self-existence. This is the Akshara, the immutable in the mutable, the immobile in the mobile, the imperishable in things perishable. Or rather, since there is only an appearance of pervasion, it is the immutable, immobile and imperishable in which proceeds all the mobility of mutable and perishable things.

The Kshara spirit visible to us as all natural existence and the totality of all existences moves and acts pervadingly in the immobile and eternal Akshara. This mobile Power of Self acts in that fundamental stability of Self, as the second principle of material Nature, Vayu, with its contactual force of aggregation and separation, attraction and repulsion, supporting the formative force of the fiery (radiant, gaseous and electric) and other elemental movements, ranges pervadingly in the subtly massive stability of ether. This Akshara is the self higher than the buddhi — it exceeds even that highest subjective principle of Nature in our being, the liberating intelligence, through which man returning beyond his restless mobile mental to his calm eternal spiritual self is at last free from the persistence of birth and the long chain of action, of Karma. This self in its highest status, *param dhāma*, is an unmanifest beyond even the unmanifest principle of the original cosmic Prakriti, Avyakta, and, if the soul turns to this Immutable, the hold of cosmos and Nature falls away from it and it passes beyond birth to an unchanging eternal existence. These two then are the two spirits we see in the world; one emerges in front in its action, the other remains behind it steadfast in that perpetual silence from which the action comes and in which all actions cease and disappear into timeless being, Nirvana. *Dvāv imau puruṣau loke kṣaraś cāksara eva ca.*

The difficulty which baffles our intelligence is that these two seem to be irreconcilable opposites with no real nexus between them or any transition from the one to the other except by an intolerant movement of separation. The Kshara acts, or at least motivates action, separately in the Akshara; the Akshara stands apart, self-centred, separate in its inactivity from the Kshara. At first sight it would almost seem better, more logical, more easy

of comprehension, if we admitted with the Sankhyas an original and eternal duality of Purusha and Prakriti, if not even an eternal plurality of souls. Our experience of the Akshara would then be simply the withdrawal of each Purusha into himself, his turning away from Nature and therefore from all contact with other souls in the relations of existence; for each is self-sufficient and infinite and complete in his own essence. But after all the final experience is that of a unity of all beings which is not merely a community of experience, a common subjection to one force of Nature, but a oneness in the spirit, a vast identity of conscious being beyond all this endless variety of determination, behind all this apparent separativism of relative existence. The Gita takes its stand in that highest spiritual experience. It appears indeed to admit an eternal plurality of souls subject to and sustained by their eternal unity, for cosmos is for ever and manifestation goes on in unending cycles; nor does it affirm anywhere or use any expression that would indicate an absolute disappearance, *laya*, the annulation of the individual soul in the Infinite. But at the same time it affirms with a strong insistence that the Akshara is the one self of all these many souls, and it is therefore evident that these two spirits are a dual status of one eternal and universal existence. That is a very ancient doctrine; it is the whole basis of the largest vision of the Upanishads,—as when the Isha tells us that Brahman is both the mobile and the immobile, is the One and the Many, is the Self and all existences, *ātman, sarvabhūtāni*, is the Knowledge and the Ignorance, is the eternal unborn status and also the birth of existences, and that to dwell only on one of these things to the rejection of its eternal counterpart is a darkness of exclusive knowledge or a darkness of ignorance. It too insists like the Gita that man must know and must embrace both and learn of the Supreme in his entirety—*samagram mām*, as the Gita puts it—in order to enjoy immortality and live in the Eternal. The teaching of the Gita and this side of the teaching of the Upanishads are so far at one; for they look at and admit both sides of the reality and still arrive at identity as the conclusion and the highest truth of existence.

But this greater knowledge and experience, however true

and however powerful in its appeal to our highest seeing, has still to get rid of a very real and pressing difficulty, a practical as well as a logical contradiction which seems at first sight to persist up to the highest heights of spiritual experience. The Eternal is other than this mobile subjective and objective experience, there is a greater consciousness, *na idam yad upāsate*:² and yet at the same time all this is the Eternal, all this is the perennial self-seeing of the Self, *sarvam khalu idam brahma*,³ *ayam ātmā brahma*.⁴ The Eternal has become all existences, *ātmā abhūt sarvāṇi bhūtāni*;⁵ as the Swetasvatara puts it, "Thou art this boy and yonder girl and that old man walking supported on his staff,"—even as in the Gita the Divine says that he is Krishna and Arjuna and Vyasa and Ushanas, and the lion and the aswattha tree, and consciousness and intelligence and all qualities and the self of all creatures. But how are these two the same, when they seem not only so opposite in nature, but so difficult to unify in experience? For when we live in the mobility of the becoming, we may be aware of but hardly live in the immortality of timeless self-existence. And when we fix ourselves in timeless being, Time and Space and circumstance fall away from us and begin to appear as a troubled dream in the Infinite. The most persuasive conclusion would be, at first sight, that the mobility of the spirit in Nature is an illusion, a thing real only when we live in it, but not real in essence, and that is why, when we go back into self, it falls away from our incorruptible essence. That is the familiar cutting of the knot of the riddle, *brahma satyam jagan mithyā*.

The Gita does not take refuge in this explanation which has enormous difficulties of its own, besides its failure to account for the illusion,—for it only says that it is all a mysterious and incomprehensible Maya, and then we might just as well say that it is all a mysterious and incomprehensible double reality, spirit concealing itself from spirit. The Gita speaks of Maya, but only as a bewildering partial consciousness which loses hold of the

² *Kena Upanishad*.

³ *Chhandogya Upanishad*: Verily all this that is is the Brahman.

⁴ *Mandukya Upanishad*: The Self is the Brahman.

⁵ *Isha Upanishad*.

complete reality, lives in the phenomenon of mobile Nature and has no sight of the Spirit of which she is the active Power, *me prakṛtiḥ*. When we transcend this Maya, the world does not disappear, it only changes its whole heart of meaning. In the spiritual vision we find not that all this does not really exist, but rather that all is, but with a sense quite other than its present mistaken significance: all is self and soul and nature of the God-head, all is Vasudeva. The world for the Gita is real, a creation of the Lord, a power of the Eternal, a manifestation from the Parabrahman, and even this lower nature of the triple Maya is a derivation from the supreme divine Nature. Nor can we take refuge altogether in this distinction that there is a double, an inferior active and temporal and a superior calm, still and eternal reality beyond action and that our liberation is to pass from this partiality to that greatness, from the action to the silence. For the Gita insists that we can and should, while we live, be conscious in the self and its silence and yet act with power in the world of Nature. And it gives the example of the Divine himself who is not bound by necessity of birth, but free, superior to the cosmos, and yet abides eternally in action, *varta eva ca karmani*. Therefore it is by putting on a likeness of the divine nature in its completeness that the unity of this double experience becomes entirely possible. But what is the principle of that oneness?

The Gita finds it in its supreme vision of the Purushottama; for that is the type, according to its doctrine, of the complete and the highest experience, it is the knowledge of the whole-knowers, *kṛtsnavidah*. The Akshara is *para*, supreme in relation to the elements and action of cosmic Nature. It is the immutable Self of all, and the immutable Self of all is the Purushottama. The Akshara is he in the freedom of his self-existence unaffected by the action of his own power in Nature, not impinged on by the urge of his own becoming, undisturbed by the play of his own qualities. But this is only one aspect though a great aspect of the integral knowledge. The Purushottama is at the same time greater than the Akshara, because he is more than this immutability and he is not limited even by the highest eternal status of his being, *param*

dhāma. Still, it is through whatever is immutable and eternal in us that we arrive at that highest status from which there is no returning to birth, and that was the liberation which was sought by the wise of old, the ancient sages. But when pursued through the Akshara alone, this attempt at liberation becomes the seeking of the Indefinable, a thing hard for our nature embodied as we are here in Matter. The Indefinable, to which the Akshara, the pure intangible self here in us rises in its separative urge, is some supreme Unmanifest, *paro avyaktah*, and that highest unmanifest Akshara is still the Purushottama. Therefore, the Gita has said, those also who follow after the Indefinable, come to me, the eternal Godhead. But yet is he more even than a highest unmanifest Akshara, more than any negative Absolute, *neti neti*, because he is to be known also as the supreme Purusha who extends this whole universe in his own existence. He is a supreme mysterious All, an ineffable positive Absolute of all things here. He is the Lord in the Kshara, Purushottama not only there, but here in the heart of every creature, Ishwara. And there too even in his highest eternal status, *paro avyaktah*, he is the supreme Lord, Parameshwara, no aloof and unrelated Indefinable, but the origin and father and mother and first foundation and eternal abode of self and cosmos and Master of all existences and enjoyer of askesis and sacrifice. It is by knowing him at once in the Akshara and the Kshara, it is by knowing him as the Unborn who partially manifests himself in all birth and even himself descends as the constant Avatar, it is by knowing him in his entirety, *samagran mām*, that the soul is easily released from the appearances of the lower Nature and returns by a vast sudden growth and broad immeasurable ascension into the divine being and supreme Nature. For the truth of the Kshara too is a truth of the Purushottama. The Purushottama is in the heart of every creature and is manifested in his countless Vibhutis; the Purushottama is the cosmic spirit in Time and it is he that gives the command to the divine action of the liberated human spirit. He is both Akshara and Kshara, and yet he is other because he is more and greater than either of these opposites. *Uttamah puruṣas tvanyah paramātmetyudāhṛtaḥ, yo lokatrayam āviśya*

bibhartyavyaya īśvarah, “But other than these two is that highest spirit called the supreme Self, who enters the three worlds and upbears them, the imperishable Lord.” This verse is the keyword of the Gita’s reconciliation of these two apparently opposite aspects of our existence.

The idea of the Purushottama has been prepared, alluded to, adumbrated, assumed even from the beginning, but it is only now in the fifteenth chapter that it is expressly stated and the distinction illuminated by a name. And it is instructive to see how it is immediately approached and developed. To ascend into the divine nature, we have been told, one must first fix oneself in a perfect spiritual equality and rise above the lower nature of the three gunas. Thus transcending the lower Prakriti we fix ourselves in the impersonality, the imperturbable superiority to all action, the purity from all definition and limitation by quality which is one side of the manifested nature of the Purushottama, his manifestation as the eternity and unity of the self, the Akshara. But there is also an ineffable eternal multiplicity of the Purushottama, a highest truest truth behind the primal mystery of soul manifestation. The Infinite has an eternal power, an unbeginning and unending action of his divine Nature, and in that action the miracle of soul personality emerges from a play of apparently impersonal forces, *prakṛtir jīvabhūtā*. This is possible because personality too is a character of the Divine and finds in the Infinite its highest spiritual truth and meaning. But the Person in the Infinite is not the egoistic, separative, oblivious personality of the lower Prakriti; it is something exalted, universal and transcendent, immortal and divine. That mystery of the supreme Person is the secret of love and devotion. The spiritual person, *puruṣa*, the eternal soul in us offers itself and all it has and is to the eternal Divine, the supreme Person and Godhead of whom it is a portion, *āṁśa*. The completeness of knowledge finds itself in this self-offering, this uplifting of our personal nature by love and adoration to the ineffable Master of our personality and its acts; the sacrifice of works receives by it its consummation and perfect sanction. It is then through these things that the soul of man fulfils itself most completely

in this other and dynamic secret, this other great and intimate aspect of the divine nature and possesses by that fulfilment the foundation of immortality, the supreme felicity and the eternal Dharma. And having so stated this double requisite, equality in the one self, adoration of the one Lord, at first separately as if they were two different ways of arriving at the Brahmic status, *brahmabhūyāya*, — one taking the form of quietistic *sannyāsa*, the other a form of divine love and divine action, — the Gita proceeds now to unite the personal and the impersonal in the Purushottama and to define their relations. For the object of the Gita is to get rid of exclusions and separative exaggerations and fuse these two sides of knowledge and spiritual experience into a single and perfect way to the supreme perfection.

First there comes a description of cosmic existence in the Vedantic image of the asvattha tree. This tree of cosmic existence has no beginning and no end, *nānto na cādiḥ*, in space or in time; for it is eternal and imperishable, *avyaya*. The real form of it cannot be perceived by us in this material world of man's embodiment, nor has it any apparent lasting foundation here; it is an infinite movement and its foundation is above in the supreme of the Infinite. Its principle is the ancient sempiternal urge to action, *pravṛtti*, which for ever proceeds without beginning or end from the original Soul of all existence, *ādyam puruṣam yataḥ pravṛtih prasṛtā purāṇī*. Therefore its original source is above, beyond Time in the Eternal, but its branches stretch down below and it extends and plunges its other roots, well-fixed and clinging roots of attachment and desire with their consequences of more and more desire and an endlessly developing action, plunges them downward here into the world of men. The hymns of the Veda are compared to its leaves and the man who knows this tree of the cosmos is the Veda-knower. And here we see the sense of that rather disparaging view of the Veda or at least of the Vedavada, which we had to notice at the beginning. For the knowledge the Veda gives us is a knowledge of the gods, of the principles and powers of the cosmos, and its fruits are the fruits of a sacrifice which is offered with desire, fruits of enjoyment and lordship in the nature of the three worlds, in earth and

heaven and the world between earth and heaven. The branches of this cosmic tree extend both below and above, below in the material, above in the supraphysical planes; they grow by the gunas of Nature, for the triple guna is all the subject of the Vedas, *traigunya-viṣayā vedāḥ*. The Vedic rhythms, *chandāṁsi*, are the leaves and the sensible objects of desire supremely gained by a right doing of sacrifice are the constant budding of the foliage. Man, therefore, so long as he enjoys the play of the gunas and is attached to desire, is held in the coils of Pravritti, in the movement of birth and action, turns about constantly between the earth and the middle planes and the heavens and is unable to get back to his supreme spiritual infinitudes. This was perceived by the sages. To achieve liberation they followed the path of Nivritti or cessation from the original urge to action, and the consummation of this way is the cessation of birth itself and a transcendent status in the highest supracosmic reach of the Eternal. But for this purpose it is necessary to cut these long-fixed roots of desire by the strong sword of detachment and then to seek for that highest goal whence, once having reached it, there is no compulsion of return to mortal life. To be free from the bewilderment of this lower Maya, without egoism, the great fault of attachment conquered, all desires stilled, the duality of joy and grief cast away, always to be fixed in wide equality, always to be firm in a pure spiritual consciousness, these are the steps of the way to that supreme Infinite. There we find the timeless being which is not illumined by sun or moon or fire, but is itself the light of the presence of the eternal Purusha. I turn away, says the Vedantic verse, to seek that original Soul alone and to reach him in the great passage. That is the highest status of the Purushottama, his supracosmic existence.

But it would seem that this can be attained very well, best even, pre-eminently, directly, by the quiescence of Sannyasa. Its appointed path would seem to be the way of the Akshara, a complete renunciation of works and life, an ascetic seclusion, an ascetic inaction. Where is the room here, or at least where is the call, the necessity, for the command to action, and what has all this to do with the maintenance of the cosmic existence,

lokasaṅgraha, the slaughter of Kurukshetra, the ways of the Spirit in Time, the vision of the million-bodied Lord and his high-voiced bidding, “Arise, slay the foe, enjoy a wealthy kingdom”? And what then is this soul in Nature? This spirit too, this Kshara, this enjoyer of our mutable existence, is the Purushottama; it is he in his eternal multiplicity, that is the Gita’s answer. “It is an eternal portion of me that becomes the Jiva in a world of Jivas.” This is an epithet, a statement of immense bearing and consequence. For it means that each soul, each being in its spiritual reality is the very Divine, however partial its actual manifestation of him in Nature. And it means too, if words have any sense, that each manifesting spirit, each of the many, is an eternal individual, an eternal unborn and undying power of the one Existence. We call this manifesting spirit the Jiva, because it appears here as if a living creature in a world of living creatures, and we speak of this spirit in man as the human soul and think of it in the terms of humanity only. But in truth it is something greater than its present appearance and not bound to its humanity: it was a lesser manifestation than the human in its past, it can become something much greater than mental man in its future. And when this soul rises above all ignorant limitation, then it puts on its divine nature of which its humanity is only a temporary veil, a thing of partial and incomplete significance. The individual spirit exists and ever existed beyond in the Eternal, for it is itself everlasting, *sanātana*. It is evidently this idea of the eternal individual which leads the Gita to avoid any expression at all suggestive of a complete dissolution, *laya*, and to speak rather of the highest state of the soul as a dwelling in the Purushottama, *nivasiyasi mayyeva*. If when speaking of the one Self of all it seems to use the language of Adwaita, yet this enduring truth of the eternal individual, *mamāṁśah sanātanah*, adds something which brings in a qualification and appears almost to accept the seeing of the Visishtadwaita,—though we must not therefore leap at once to the conclusion that that alone is the Gita’s philosophy or that its doctrine is identical with the later doctrine of Ramanuja. Still this much is clear that there is an eternal, a real and not only an illusive

principle of multiplicity in the spiritual being of the one divine Existence.

This eternal individual is not other than or in any way really separate from the Divine Purusha. It is the Lord himself, the Ishwara who by virtue of the eternal multiplicity of his oneness — is not all existence a rendering of that truth of the Infinite? — exists for ever as the immortal soul within us and has taken up this body and goes forth from the transient framework when it is cast away to disappear into the elements of Nature. He brings in with him and cultivates for the enjoyment of the objects of mind and sense the subjective powers of Prakriti, mind and the five senses, and in his going forth too he goes taking them as the wind takes the perfumes from a vase. But the identity of the Lord and the soul in mutable Nature is hidden from us by outward appearance and lost in the crowding mobile deceptions of that Nature. And those who allow themselves to be governed by the figures of Nature, the figure of humanity or any other form, will never see it, but will ignore and despise the Divine lodged in the human body. Their ignorance cannot perceive him in his coming in and his going forth or in his staying and enjoying and assumption of quality, but sees only what is there visible to the mind and senses, not the greater truth which can only be glimpsed by the eye of knowledge. Never can they have sight of him, even if they strive to do so, until they learn to put away the limitations of the outward consciousness and build in themselves their spiritual being, create for it, as it were, a form in their nature. Man, to know himself, must be *kṛtātmā*, formed and complete in the spiritual mould, enlightened in the spiritual vision. The Yogins who have this eye of knowledge, see the Divine Being we are in their own endless reality, their own eternity of spirit. Illumined, they see the Lord in themselves and are delivered from the crude material limitation, from the form of mental personality, from the transient life formulation: they dwell immortal in the truth of the self and spirit. But they see him too not only in themselves, but in all the cosmos. In the light of the sun that illuminates all this world they witness the light of the Godhead which is in us; the light in the moon and in fire is

the light of the Divine. It is the Divine who has entered into this form of earth and is the spirit of its material force and sustains by his might these multitudes. The Divine is the godhead of Soma who by the *rasa*, the sap in the Earth-mother, nourishes the plants and trees that clothe her surface. The Divine and no other is the flame of life that sustains the physical body of living creatures and turns its food into sustenance of their vital force. He is lodged in the heart of every breathing thing; from him are memory and knowledge and the debates of the reason. He is that which is known by all the Vedas and by all forms of knowing; he is the knower of Veda and the maker of Vedanta. In other words, the Divine is at once the Soul of matter and the Soul of life and the Soul of mind as well as the Soul of the supramental light that is beyond mind and its limited reasoning intelligence.

Thus the Divine is manifest in a double soul of his mystery, a twofold power, *dvāv imau puruṣau*; he supports at once the spirit of mutable things that is all these existences, *kṣarāḥ sarvāṇī bhūtāni*, and the immutable spirit that stands above them in his imperturbable immobility of eternal silence and calm. And it is by the force of the Divine in them that the mind and heart and will of man are so powerfully drawn in different directions by these two spirits as if by opposing and incompatible attractions one insistent to annul the other. But the Divine is neither wholly the Kshara, nor wholly the Akshara. He is greater than the immutable Self and he is much greater than the Soul of mutable things. If he is capable of being both at once, it is because he is other than they, *anyah*, the Purushottama above all cosmos and yet extended in the world and extended in the Veda, in self-knowledge and in cosmic experience. And whoever thus knows and sees him as the Purushottama, is no longer bewildered whether by the world-appearance or by the separate attraction of these two apparent contraries. These at first confront each other here in him as a positive of the cosmic action and as its negative in the Self who has no part in an action that belongs or seems to belong entirely to the ignorance of Nature. Or again they challenge his consciousness as

a positive of pure, indeterminable, stable, eternal self-existence and as its negative of a world of elusive determinations and relations, ideas and forms, perpetual unstable becoming and the creating and uncreating tangle of action and evolution, birth and death, appearance and disappearance. He embraces and escapes them, overcomes their opposition and becomes all-knowing, *sarvavid*, a whole-knower. He sees the entire sense both of the self and of things; he restores the integral reality of the Divine;⁶ he unites the Kshara and the Akshara in the Purushottama. He loves, worships, cleaves to and adores the supreme Self of his and all existence, the one Lord of his and all energies, the close and far-off Eternal in and beyond the world. And he does this too with no single side or portion of himself, exclusive spiritualised mind, blinding light of the heart intense but divorced from largeness, or sole aspiration of the will in works, but in all the perfectly illumined ways of his being and his becoming, his soul and his nature. Divine in the equality of his imperturbable self-existence, one in it with all objects and creatures, he brings that boundless equality, that deep oneness down into his mind and heart and life and body and founds on it in an indivisible integrality the trinity of divine love, divine works and divine knowledge. This is the Gita's way of salvation.

And is that not too after all the real Adwaita which makes no least scission in the one eternal Existence? This utmost undividing Monism sees the one as the one even in the multiplicities of Nature, in all aspects, as much in the reality of self and of cosmos as in that greatest reality of the supracosmic which is the source of self and the truth of the cosmos and is not bound either by any affirmation of universal becoming or by any universal or absolute negation. That at least is the Adwaita of the Gita. This is the most secret Shastra, says the Teacher to Arjuna; this is the supreme teaching and science which leads us into the heart of the highest mystery of existence. Absolutely to know it, to seize it in knowledge and feeling and force and experience is to

⁶ *samagramā mām.*

be perfected in the transformed understanding, divinely satisfied in heart and successful in the supreme sense and objective of all will and action and works. It is the way to be immortal, to rise towards the highest divine nature and to assume the eternal Dharma.

The Fullness of Spiritual Action

THE DEVELOPMENT of the idea of the Gita has reached a point at which one question alone remains for solution, — the question of our nature bound and defective and how it is to effect, not only in principle but in all its movements, its evolution from the lower to the higher being and from the law of its present action to the immortal Dharma. The difficulty is one which is implied in certain of the positions laid down in the Gita, but has to be brought out into greater prominence than it gets there and to be put into a clearer shape before our intelligence. The Gita proceeded on a psychological knowledge which was familiar to the mind of the time, and in the steps of its thought it was well able to abridge its transitions, to take much for granted and to leave many things unexpressed which we need to have put strongly into light and made precise to us. Its teaching sets out at the beginning to propose a new source and level for our action in the world; that was the starting-point and that motives also the conclusion. Its initial object was not precisely to propose a way of liberation, *mokṣa*, but rather to show the compatibility of works with the soul's effort towards liberation and of spiritual freedom itself when once attained with continued action in the world, *muktasya karma*. Incidentally, a synthetic Yoga or psychological method of arriving at spiritual liberation and perfection has been developed and certain metaphysical affirmations have been put forward, certain truths of our being and nature on which the validity of this Yoga reposes. But the original preoccupation remains throughout, the original difficulty and problem, how Arjuna, dislodged by a strong revulsion of thought and feeling from the established natural and rational foundations and standards of action, is to find a new and satisfying spiritual norm of works, or how he is to live in the truth of the Spirit — since he can

no longer act according to the partial truths of the customary reason and nature of man — and yet to do his appointed work on the battle-field of Kurukshetra. To live inwardly calm, detached, silent in the silence of the impersonal and universal Self and yet do dynamically the works of dynamic Nature, and more largely, to be one with the Eternal within us and to do all the will of the Eternal in the world expressed through a sublimated force, a divine height of the personal nature uplifted, liberated, universalised, made one with God-nature, — this is the Gita's solution.

Let us see what this comes to in the most plain and positive terms and from the standpoint of the problem which is at the root of Arjuna's difficulty and refusal. His duty as a human being and a social being is the discharge of the high function of the Kshatriya without which the frame of society cannot be maintained, the ideals of the race cannot be vindicated, the harmonious order of right and justice cannot be upheld against the anarchic violence of oppression, wrong and injustice. And yet the appeal to duty by itself can no longer satisfy the protagonist of the struggle because in the terrible actuality of Kurukshetra it presents itself in harsh, perplexed and ambiguous terms. The discharge of his social duty has suddenly come to signify assent to an enormous result of sin and sorrow and suffering; the customary means of maintaining social order and justice is found to lead instead to a great disorder and chaos. The rule of just claim and interest, that which we call rights, will not serve him here; for the kingdom he has to win for himself and his brothers and his side in the war is indeed rightly theirs and its assertion an overthrow of Asuric tyranny and a vindication of justice, but a blood-bespattered justice and a kingdom possessed in sorrow and with the stain on it of a great sin, a monstrous harm done to society, a veritable crime against the race. Nor will the rule of Dharma, of ethical right, serve any better; for there is here a conflict of dharmas. A new and greater yet unguessed rule is needed to solve the problem, but what is that rule?

For to withdraw from his work, to take refuge in a saintly inactivity and leave the imperfect world with its unsatisfying

methods and motives to take care of itself is one possible solution easy to envisage, easy to execute, but this is the very cutting of the knot that has been insistently forbidden by the Teacher. Action is demanded of man by the Master of the world who is the master of all his works and whose world is a field of action, whether done through the ego and in the ignorance or partial light of the limited human reason or initiated from a higher and more largely seeing plane of vision and motive. Again, to abandon this particular action as evil would be another kind of solution, the ready resort of the shortsighted moralising mind, but to this evasion too the Teacher refuses his assent. Arjuna's abstention would work a much greater sin and evil: it would mean, if it had any effect at all, the triumph of wrong and injustice and the rejection of his own mission as an instrument of the divine workings. A violent crisis in the destinies of the race has been brought about not by any blind motion of forces or solely by the confused clash of human ideas, interests, passions, egoisms, but by a Will which is behind these outward appearances. This truth Arjuna must be brought to see; he must learn to act impersonally, imperturbably as the instrument not of his little personal desires and weak human shrinkings, but of a vaster and more luminous Power, a greater all-wise divine and universal Will. He must act impersonally and universally in a high union of his soul with the inner and outer Godhead, *yukta*, in a calm Yoga with his own supreme Self and the informing Self of the universe.

But this truth cannot be rightly seen and this kind of action cannot be rightly undertaken, cannot become real as long as man is governed by the ego, even by the half-enlightened unilluminated sattvic ego of the reason and the mental intelligence. For this is a truth of the spirit, this is an action from a spiritual basis. A spiritual, not an intellectual knowledge is the indispensable requisite for this way of works, its sole possible light, medium, incentive. First, therefore, the Teacher points out that all these ideas and feelings which trouble, perplex and baffle Arjuna, joy and sorrow, desire and sin, the mind's turn towards governing action by the outward results of action, the human shrinking from what seems terrible and formidable in the dealings of the

universal Spirit with the world, are things born of the subjection of our consciousness to a natural ignorance, the way of working of a lower nature in which the soul is involved and sees itself as a separate ego returning to the action of things upon it dual reactions of pain and pleasure, virtue and vice, right and wrong, good happening and evil fortune. These reactions create a tangled web of perplexity in which the soul is lost and bewildered by its own ignorance; it has to guide itself by partial and imperfect solutions that serve ordinarily with a stumbling sufficiency in the normal life, but fail when brought to the test of a wider seeing and a profounder experience. To understand the real sense of action and existence one must retreat behind all these appearances into the truth of the spirit; one must found self-knowledge before one can have the basis of a right world-knowledge.

The first requisite is to shake the wings of the soul free from desire and passion and troubling emotion and all this perturbed and distorting atmosphere of human mind and arrive into an ether of dispassionate equality, a heaven of impersonal calm, an egoless feeling and vision of things. For only in that lucid upper air, reaches free from all storm and cloud, can self-knowledge come and the law of the world and the truth of Nature be seen steadily and with an embracing eye and in an undisturbed and all-comprehending and all-penetrating light. Behind this little personality which is a helpless instrument, a passive or vainly resistant puppet of Nature and a form figured in her creations, there is an impersonal self one in all which sees and knows all things; there is an equal, impartial, universal presence and support of creation, a witnessing consciousness that suffers Nature to work out the becoming of things in their own type, *svabhāva*, but does not involve and lose itself in the action she initiates. To draw back from the ego and the troubled personality into this calm, equal, eternal, universal, impersonal Self is the first step towards a seeing action in Yoga done in conscious union with the divine Being and the infallible Will that, however obscure now to us, manifests itself in the universe.

When we live tranquilly poised in this self of impersonal wideness, then because that is vast, calm, quiescent, impersonal,

our other little false self, our ego of action disappears into its largeness and we see that it is Nature that acts and not we, that all action is the action of Nature and can be nothing else. And this thing we call Nature is a universal executive Power of eternal being in motion which takes different shapes and forms in this or that class of its creatures and in each individual of the species according to its type of natural existence and the resultant function and law of its works. According to its nature each creature must act and it cannot act by anything else. Ego and personal will and desire are nothing more than vividly conscious forms and limited natural workings of a universal Force that is itself formless and infinite and far exceeds them; reason and intelligence and mind and sense and life and body, all that we vaunt or take for our own, are Nature's instruments and creations. But the impersonal Self does not act and is not part of Nature: it observes the action from behind and above and remains lord of itself and a free and impassive knower and witness. The soul that lives in this impersonality is not affected by the actions of which our nature is an instrument; it does not reply to them or their effects by grief and joy, desire and shrinking, attraction and repulsion or any of the hundred dualities that draw and shake and afflict us. It regards all men and all things and all happenings with equal eyes, watches the modes or qualities of Nature acting on the modes or qualities, sees the whole secret of the mechanism, but is itself beyond these modes and qualities, a pure absolute essential being, impassive, free, at peace. Nature works out her action and the soul impersonal and universal supports her but is not involved, is not attached, is not entangled, is not troubled, is not bewildered. If we can live in this equal self, we too are at peace; our works continue so long as Nature's impulsion prolongs itself in our instruments, but there is a spiritual freedom and quiescence.

This duality of Self and Nature, quiescent Purusha, active Prakriti, is not, however, the whole of our being; these are not really the two last words in the matter. If it were so, either all works would be quite indifferent to the soul and this or that action or refraining from action would take place by some ungoverned

turn of the mobile variations of the gunas,—Arjuna would be moved to battle by rajasic impulse in the instruments or withheld from it by tamasic inertia or sattwic indifference,—or else, if it so is that he must act and act only in this way, it would be by some mechanical determinism of Nature. Moreover, since the soul in its retreat would come to live in the impersonal quiescent Self and cease to live at all in active Nature, the final result would be quiescence, cessation, inertia, not the action imposed by the Gita. And, finally, this duality gives no real explanation why the soul is at all called to involve itself in Nature and her works; for it cannot be that the one ever uninvolved self-conscious spirit gets itself involved and loses its self-knowledge and has to return to that knowledge. This pure Self, this Atman is on the contrary always there, always the same, always the one self-conscious impersonal aloof Witness or impartial supporter of the action. It is this lacuna, this impossible vacuum that compels us to suppose two Purushas or two poses of the one Purusha, one secret in the Self that observes all from its self-existence—or perhaps observes nothing, another self-projected into Nature that lends itself to her action and identifies itself with her creations. But even this dualism of Self and Prakriti or Maya corrected by the dualism of the two Purushas is not the whole philosophic creed of the Gita. It goes beyond them to the supreme all-embracing oneness of a highest Purusha, Purushottama.

The Gita affirms that there is a supreme Mystery, a highest Reality that upholds and reconciles the truth of these two different manifestations. There is an utmost supreme Self, Lord and Brahman, one who is both the impersonal and the personal, but other and greater than either of them and other and greater than both of them together. He is Purusha, Self and soul of our being, but he is also Prakriti; for Prakriti is the power of the All-Soul, the power of the Eternal and Infinite self-moved to action and creation. The supreme Ineffable, the universal Person, he becomes by his Prakriti all these creatures. The supreme Atman and Brahman, he manifests by his Maya of self-knowledge and his Maya of ignorance the double truth of the cosmic riddle. The supreme Lord, master of his Force, his Shakti, he creates, impels

and governs all this Nature and all the personality, power and works of these innumerable existences. Each soul is a partial being of this self-existent One, an eternal soul of this All-Soul, a partial manifestation of this supreme Lord and his universal Nature. All here is this Divine, this Godhead, Vasudeva; for by Nature and the soul in Nature he becomes all that is and everything proceeds from him and lives in or by him, though he himself is greater than any widest manifestation, any deepest spirit, any cosmic figure. This is the complete truth of existence and this all the secret of the universal action that we have seen disengaging itself from the later chapters of the Gita.

But how does this greater truth modify or how affect the principle of spiritual action? It modifies it to begin with in this fundamental matter that the whole meaning of the relation of Self and soul and Nature gets changed, opens out to a new vision, fills in the blanks that were left, acquires a greater amplitude, assumes a true and spiritually positive, a flawlessly integral significance. The world is no longer a purely mechanical qualitative action and determination of Nature set over against the quiescence of an impersonal self-existence which has no quality or power of self-determination, no ability or impulse to create. The chasm left by this unsatisfactory dualism is bridged and an uplifting unity revealed between knowledge and works, the soul and Nature. The quiescent impersonal Self is a truth,—it is the truth of the calm of the Godhead, the silence of the Eternal, the freedom of the Lord of all birth and becoming and action and creation, his calm infinite freedom of self-existence not bound, troubled or affected by his creation, not touched by the action and reaction of his Nature. Nature itself is now no inexplicable illusion, no separated and opposite phenomenon, but a movement of the Eternal, all her stir and activity and multiplicity founded and supported on the detached and observing tranquillity of an immutable self and spirit. The Lord of Nature remains that immutable self even while he is at the same time the one and multiple soul of the universe and becomes in a partial manifestation all these forces, powers, consciousnesses, gods, animals, things, men. Nature of the gunas is a lower self-

limited action of his power; it is nature of imperfectly conscious manifestation and therefore of a certain ignorance. The truth of the self, even as the truth of the Divine, is held back from her surface force absorbed here in its outer action — much as man's deeper being is held back from the knowledge of his surface consciousness — until the soul in her turns to find out this hidden thing, gets inside itself and discovers its own real verities, its heights and its depths. That is why it has to draw back from its little personal and egoistic to its large and impersonal, immutable and universal Self in order to become capable of self-knowledge. But the Lord is there, not only in that self, but in Nature. He is in the heart of every creature and guides by his presence the turnings of this great natural mechanism. He is present in all, all lives in him, all is himself because all is a becoming of his being, a portion or a figure of his existence. But all proceeds here in a lower partial working that has come out of a secret, a higher and greater and completer nature of Divinity, the eternal infinite nature or absolute self-power of the Godhead, *devātmaśakti*. The perfect, integrally conscious soul hidden in man, an eternal portion of Deity, a spiritual being of the eternal Divine Being, can open in us and can too open us to him if we live constantly in this true truth of his action and our existence. The seeker of Godhead has to get back to the reality of his immutable and eternal impersonal self and at the same time he has to see everywhere the Divine from whom he proceeds, to see him as all, to see him in the whole of this mutable Nature and in every part and result of her and in all her workings, and there too to make himself one with God, there too to live in him, to enter there too into the divine oneness. He unites in that integrality the divine calm and freedom of his deep essential existence with a supreme power of instrumental action in his divinised self of Nature.

But how is this to be done? It can be done first by a right spirit in our will of works. The seeker has to regard all his action as a sacrifice to the Lord of works who is the eternal and universal Being and his own highest Self and the Self of all others and the supreme all-inhabiting, all-containing, all-governing

Godhead in the universe. The whole action of Nature is such a sacrifice,—offered at first indeed to the divine Powers that move her and move in her, but these powers are only limited forms and names of the One and Illimitable. Man ordinarily offers his sacrifice openly or under a disguise to his own ego; his oblation is the false action of his own self-will and ignorance. Or he offers his knowledge, action, aspiration, works of energy and effort to the gods for partial, temporal and personal aims. The man of knowledge, the liberated soul offers on the contrary all his activities to the one eternal Godhead without any attachment to their fruit or to the satisfaction of his lower personal desires. He works for God, not for himself, for the universal welfare, for the Soul of the world and not for any particular object which is of his own personal creation or for any construction of his mental will or object of his vital longings, as a divine agent, not as a principal and separate profiteer in the world-commerce. And this, it must be noted, is a thing that cannot be really done except in proportion as the mind arrives at equality, universality, wide impersonality, and a clear freedom from every disguise of the insistent ego: for without these things the claim to be thus acting is a pretension or an illusion. The whole action of the world is the business of the Lord of the universe, the concern of the self-existent Spirit of whom it is the unceasing creation, the progressive becoming, the significant manifestation and living symbol in Nature. The fruits are his, the results are those determined by him and our personal action is only a minor contribution ruled or overruled, so far as its motive is an egoistic claim, by this Self and Spirit in us who is the Self and Spirit in all and governs things for the universal end and good and not for the sake of our ego. To work impersonally, desirelessly and without attachment to the fruits of our work, for the sake of God and the world and the greater Self and the fulfilment of the universal will,—this is the first step towards liberation and perfection.

But beyond this step there lies that other greater motion, the inner surrender of all our actions to the Divinity within us. For it is infinite Nature that impels our works and a divine

Will in and above her that demands action of us; the choice and turn our ego gives to it is a contribution of our tamasic, rajasic, sattwic quality, a deformation in the lower Nature. The deformation comes by the ego thinking of itself as the doer; the character of the act takes the form of the limited personal nature and the soul is bound up with that and its narrow figures and does not allow the act to proceed freely and purely from the infinite power within it. And the ego is chained to the act and its outcome; it must suffer the personal consequence and reaction even as it claims the responsible origination and personal will of the doing. The free perfect working comes first by referring and finally by surrendering altogether the action and its origination to the divine Master of our existence; for we feel it progressively taken up by a supreme Presence within us, the soul drawn into deep intimacy and close unity with an inner Power and Godhead and the work originated directly from the greater Self, from the all-wise, infinite, universal force of an eternal being and not from the ignorance of the little personal ego. The action is chosen and shaped according to the nature, but entirely by the divine Will in the nature, and it is therefore free and perfect within, whatever its outward appearance; it comes stamped with the inward spiritual seal of the Infinite as the thing to be done, the movement and the step of the movement decreed in the ways of the omniscient Master of action, *kartavyam karma*. The soul of the liberated man is free in its impersonality, even while he contributes to the action as its means and its occasion his instrumental personal self-creation and the special will and power in his nature. That will and power is now not separately, egoistically his own, but a force of the suprapersonal Divine who acts in this becoming of his own self, this one of his myriad personalities by means of the characteristic form of the natural being, the swabhava. This is the high secret and mystery, *uttamam rahasyam*, of the action of the liberated man. It is the result of a growing of the human soul into a divine Light and of the union of its nature with a highest universal nature.

This change cannot come about except by knowledge. There is necessary a right knowledge of self and God and world and a

living and growing into the greater consciousness to which that knowledge admits us. We know now what the knowledge is. It is sufficient to remember that it reposes on another and wider vision than the human mental, a changed vision and experience by which one is first of all liberated from the limitations of the ego sense and its contacts and feels and sees the one self in all, all in God, all beings as Vasudeva, all as vessels of the Godhead and one's self too as a significant being and soul-power of that one Godhead; it treats in a spiritual uniting consciousness all the happenings of the lives of others as if they were happenings of one's own life; it allows no wall of separation and lives in a universal sympathy with all existences, while amidst the world-movement one still does the work that has to be done for the good of all, *sarva-bhūta-hite*, according to the way appointed by the Divine and in the measures imposed by the command of the Spirit who is Master of Time. Thus living and acting in this knowledge the soul of man becomes united with the Eternal in personality and in impersonality, lives in the Eternal though acting in Time, even as the Eternal acts, and is free, perfect and blissful whatever may be the form and determination of the work done in Nature.

The liberated man has the complete and total knowledge, *kṛtsnavid*, and does all works without any of the restrictions made by the mind, *kṛtsna-karma-kṛt*, according to the force and freedom and infinite power of the divine will within him. And since he is united with the Eternal, he has too the pure spiritual and illimitable joy of his eternal existence. He turns with adoration to the Self of whom he is a portion, the Master of his works and divine Lover of his soul and nature. He is not an impassive calm spectator only; he lifts not only his knowledge and will to the Eternal, but his heart also of love and adoration and passion. For without that uplifting of the heart his whole nature is not fulfilled and united with God; the ecstasy of the spirit's calm needs to be transformed by the ecstasy of the soul's Ananda. Beyond the personal Jiva and the impersonal Brahman or Atman he reaches the supracosmic Purushottama who is immutable in impersonality and fulfils himself in personality and draws us to

him through these two different attractions. The liberated seeker rises personally to that highest Numen by his soul's love and joy in God and the adoration of the will in him for the Master of its works; the peace and largeness of his impersonal universal knowledge is perfected by delight in the self-existent integral close and intimate reality of this surpassing and universal God-head. This delight glorifies his knowledge and unites it with the eternal delight of the Spirit in its self and its manifestation; this perfects too his personality in the superperson of the divine Purusha and makes his natural being and action one with eternal beauty, eternal harmony, eternal love and Ananda.

But all this change means a total passing from the lower human to the higher divine nature. It is a lifting of our whole being or at least of the whole mental being that wills, knows and feels beyond what we are into some highest spiritual consciousness, some satisfying fullest power of existence, some deepest widest delight of the spirit. And this may well be possible by a transcendence of our present natural life, it may well be possible in some celestial state beyond the earthly existence or still beyond in a supracosmic superconsciousness; it may happen by transition to an absolute and infinite power and status of the Spirit. But while we are here in the body, here in life, here in action, what in this change becomes of the lower nature? For at present all our activities are determined in their trend and shape by the nature, and this Nature here is the nature of the three gunas, and in all natural being and in all natural activities there is the triple guna, tamas with its ignorance and inertia, rajas with its kinesis and action, its passion and grief and perversion, sattwa with its light and happiness, and the bondage of these things. And granted that the soul becomes superior in the self to the three gunas, how does it escape in its instrumental nature from their working and result and bondage? For even the man of knowledge, says the Gita, must act according to his nature. To feel and bear the reactions of the gunas in the outer manifestation, but to be free from them and superior in the observing conscious self behind is not sufficient; for it leaves still a dualism of freedom and subjection, a contradiction between what we are within and

what we are without, between our self and our power, what we know ourselves to be and what we will and do. Where is the release here, where the full elevation and transformation to the higher spiritual nature, the immortal Dharma, the law proper to the infinite purity and power of a divine being? If this change cannot be effected while in the body, then so it must be said, that the whole nature cannot be transformed and there must remain an unreconciled duality until the mortal type of existence drops off like a discarded shell from the spirit. But in that case the gospel of works cannot well be the right or at least cannot be the ultimate gospel: a perfect quiescence or at least as perfect a quiescence as possible, a progressive Sannyasa and renunciation of works would seem still to be the true counsel of perfection, — as indeed the Mayavadin contends, who says that the Gita's way is no doubt the right way so long as we remain in action, but still all works are an illusion and quiescence the highest path. To act in this spirit is well, but only as a transition to a renunciation of all works, to cessation, to an absolute quiescence.

This is the difficulty which the Gita has still to meet in order to justify works to the seeker after the Spirit. Otherwise it must say to Arjuna, "Act temporarily in this fashion, but afterwards seek the higher way of renunciation of works." But on the contrary it has said that not the cessation of works, but renunciation of desire is the better way; it has spoken of the action of the liberated man, *muktasya karma*. It has even insisted on doing all actions, *sarvāṇi karmāṇi, kṛtsna-karma-kṛt*; it has said that in whatever way the perfected Yогin lives and acts, he lives and acts in God. This can only be, if the nature also in its dynamics and workings becomes divine, a power imperturbable, intangible, inviolate, pure and untroubled by the reactions of the inferior Prakriti. How and by what steps is this most difficult transformation to be effected? What is this last secret of the soul's perfection? what the principle or the process of this transmutation of our human and earthly nature?

XVII

Deva and Asura¹

THE PRACTICAL difficulty of the change from the ignorant and shackled normal nature of man to the dynamic freedom of a divine and spiritual being will be apparent if we ask ourselves, more narrowly, how the transition can be effected from the fettered embarrassed functioning of the three qualities to the infinite action of the liberated man who is no longer subject to the gunas. The transition is indispensable; for it is clearly laid down that he must be above or else without the three gunas, *trigunātīta, nistraigunya*. On the other hand it is no less clearly, no less emphatically laid down that in every natural existence here on earth the three gunas are there in their inextricable working and it is even said that all action of man or creature or force is merely the action of these three modes upon each other, a functioning in which one or other predominates and the rest modify its operation and results, *gunā gunęsu vartante*. How then can there be another dynamic and kinetic nature or any other kind of works? To act is to be subject to the three qualities of Nature; to be beyond these conditions of her working is to be silent in the Spirit. The Ishwara, the Supreme who is master of all her works and functions and guides and determines them by his divine will, is indeed above this mechanism of quality, not touched or limited by her modes, but still it would seem that he acts always through them, always shapes by the power of the swabhava and through the psychological machinery of the gunas. These three are fundamental properties of Prakriti, necessary operations of the executive Nature-force which takes shape here in us, and the Jiva himself is only a portion of the Divine in this Prakriti. If then the liberated man still does works, still moves in the kinetic movement, it must be

¹ Gita, XVI.

so that he moves and acts, in Nature and by the limitation of her qualities, subject to their reactions, not, in so far as the natural part of him persists, in the freedom of the Divine. But the Gita has said exactly the opposite, that the liberated Yогin is delivered from the guna reactions and whatever he does, however he lives, moves and acts in God, in the power of his freedom and immortality, in the law of the supreme eternal Infinite, *sarvathā vartamāno'pi sa yogī mayi vartate*. There seems here to be a contradiction, an impasse.

But this is only when we knot ourselves up in the rigid logical oppositions of the analytic mind, not when we look freely and subtly at the nature of spirit and at the spirit in Nature. What moves the world is not really the modes of Prakriti,—these are only the lower aspect, the mechanism of our normal nature. The real motive power is a divine spiritual Will which uses at present these inferior conditions, but is itself not limited, not dominated, not mechanised, as is the human will, by the gunas. No doubt, since these modes are so universal in their action, they must proceed from something inherent in the power of the Spirit; there must be powers in the divine Will-force from which these aspects of Prakriti have their origin. For everything in the lower normal nature is derived from the higher spiritual power of being of the Purushottama, *mattah pravartate*; it does not come into being *de novo* and without a spiritual cause. Something in the essential power of the spirit there must be from which the sattwic light and satisfaction, the rajasic kinesis, the tamasic inertia of our nature are derivations and of which they are the imperfect or degraded forms. But once we get back to these sources in their purity above this imperfection and degradation of them in which we live, we shall find that these motions put on a quite different aspect as soon as we begin to live in the spirit. Being and action and the modes of being and action become altogether different things, far above their present limited appearance.

For what is behind this troubled kinesis of the cosmos with all its clash and struggle? What is it that when it touches the mind, when it puts on mental values, creates the reactions of desire, striving, straining, error of will, sorrow, sin, pain? It is a

will of the spirit in movement, it is a large divine will in action which is not touched by these things; it is a power² of the free and infinite conscious Godhead which has no desire because it exercises a universal possession and a spontaneous Ananda of its movements. Wearied by no striving and straining, it enjoys a free mastery of its means and its objects; misled by no error of the will, it holds a knowledge of self and things which is the source of its mastery and its Ananda; overcome by no sorrow, sin or pain, it has the joy and purity of its being and the joy and purity of its power. The soul that lives in God acts by this spiritual will and not by the normal will of the unliberated mind: its kinesis takes place by this spiritual force and not by the rajasic mode of Nature, precisely because it no longer lives in the lower movement to which that deformation belongs, but has got back in the divine nature to the pure and perfect sense of the kinesis.

And again what is behind the inertia of Nature, behind this Tamas which, when complete, makes her action like the blind driving of a machine, a mechanical impetus unobservant of anything except the groove in which it is set to spin and not conscious even of the law of that motion,—this Tamas that turns cessation of the accustomed action into death and disintegration and becomes in the mind a power for inaction and ignorance? This tamas is an obscurity which mistranslates, we may say, into inaction of power and inaction of knowledge the Spirit's eternal principle of calm and repose—the repose which the Divine never loses even while he acts, the eternal repose which supports his integral action of knowledge and the force of his creative will both there in its own infinities and here in an apparent limitation of its working and self-awareness. The peace of the Godhead is not a disintegration of energy or a vacant inertia; it would keep all that Infinity has known and done gathered up and concentratedly conscious in an omnipotent silence even if the Power everywhere ceased for a time actively to know and create. The Eternal does not need to sleep or rest; he does not get tired and flag; he has no need

² *tapas, cit-śakti.*

of a pause to refresh and recreate his exhausted energies; for his energy is inexhaustibly the same, indefatigable and infinite. The Godhead is calm and at rest in the midst of his action; and on the other hand his very cessation of action would retain in it the full power and all the potentialities of his kinesis. The liberated soul enters into this calm and participates in the eternal repose of the spirit. This is known to everyone who has had any taste at all of the joy of liberation, that it contains an eternal power of calm. And that profound tranquillity can remain in the very heart of action, can persevere in the most violent motion of forces. There may be an impetuous flood of thought, doing, will, movement, an overflowing rush of love, the emotion of the self-existent spiritual ecstasy at its strongest intensity, and that may extend itself to a fiery and forceful spiritual enjoyment of things and beings in the world and in the ways of Nature, and yet this tranquillity and repose would be behind the surge and in it, always conscious of its depths, always the same. The calm of the liberated man is not an indolence, incapacity, insensibility, inertia; it is full of immortal power, capable of all action, attuned to deepest delight, open to profoundest love and compassion and to every manner of intensest Ananda.

And so too beyond the inferior light and happiness of that purest quality of Nature, Sattwa, the power that makes for assimilation and equivalence, right knowledge and right dealing, fine harmony, firm balance, right law of action, right possession and brings so full a satisfaction to the mind, beyond this highest thing in the normal nature, admirable in itself so far as it goes and while it can be maintained, but precarious, secured by limitation, dependent on rule and condition, there is at its high and distant source a greater light and bliss free in the free spirit. That is not limited nor dependent on limitation or rule or condition but self-existent and unalterable, not the result of this or that harmony amid the discords of our nature but the fount of harmony and able to create whatever harmony it will. That is a luminous spiritual and in its native action a direct supramental force of knowledge, *jyotiḥ*, not our modified and derivative mental light, *prakāśa*. That is the light and bliss

of widest self-existence, spontaneous self-knowledge, intimate universal identity, deepest self-interchange, not of acquisition, assimilation, adjustment and laboured equivalence. That light is full of a luminous spiritual will and there is no gulf or disparateness between its knowledge and its action. That delight is not our paler mental happiness, *sukham*, but a profound concentrated intense self-existent bliss extended to all that our being does, envisages, creates, a fixed divine rapture, Ananda. The liberated soul participates more and more profoundly in this light and bliss and grows the more perfectly into it, the more integrally it unites itself with the Divine. And while among the gunas of the lower Nature there is a necessary disequilibrium, a shifting inconstancy of measures and a perpetual struggle for domination, the greater light and bliss, calm, will of kinesis of the Spirit do not exclude each other, are not at war, are not even merely in equilibrium, but each an aspect of the two others and in their fullness all are inseparable and one. Our mind when it approaches the Divine may seem to enter into one to the exclusion of another, may appear for instance to achieve calm to the exclusion of kinesis of action, but that is because we approach him first through the selecting spirit in the mind. Afterwards when we are able to rise above even the spiritual mind, we can see that each divine power contains all the rest and can get rid of this initial error.³

We see then that action is possible without the subjection of the soul to the normal degraded functioning of the modes of Nature. That functioning depends on the mental, vital and physical limitation into which we are cast; it is a deformation, an incapacity, a wrong or depressed value imposed on us by the mind and life in matter. When we grow into the spirit, this

³ The account given here of the supreme spiritual and supramental forms of highest Nature action corresponding to the gunas is not derived from the Gita, but introduced from spiritual experience. The Gita does not describe in any detail the action of the highest Nature, *rahasyam uttamam*; it leaves that for the seeker to discover by his own spiritual experience. It only points out the nature of the high sattvic temperament and action through which this supreme mystery has to be reached and insists at the same time on the overpassing of Sattwa and transcendence of the three gunas.

dharma or inferior law of Nature is replaced by the immortal dharma of the spirit; there is the experience of a free immortal action, a divine illimitable knowledge, a transcendent power, an unfathomable repose. But still there remains the question of the transition; for there must be a transition, a proceeding by steps, since nothing in God's workings in this world is done by an abrupt action without procedure or basis. We have the thing we seek in us, but we have in practice to evolve it out of the inferior forms of our nature.⁴ Therefore in the action of the modes itself there must be some means, some leverage, some *point d'appui*, by which we can effect this transformation. The Gita finds it in the full development of the sattwic guna till that in its potent expansion reaches a point at which it can go beyond itself and disappear into its source. The reason is evident, because sattwa is a power of light and happiness, a force that makes for calm and knowledge, and at its highest point it can arrive at a certain reflection, almost a mental identity with the spiritual light and bliss from which it derives. The other two gunas cannot get this transformation, rajas into the divine kinetic will or tamas into the divine repose and calm, without the intervention of the sattwic power in Nature. The principle of inertia will always remain an inert inaction of power or an incapacity of knowledge until its ignorance disappears in illumination and its torpid incapacity is lost in the light and force of the omnipotent divine will of repose. Then only can we have the supreme calm. Therefore tamas must be dominated by sattwa. The principle of rajas for the same reason must remain always a restless, troubled, feverish or unhappy working because it has not right knowledge; its native movement is a wrong and perverse action, perverse through ignorance. Our will must purify itself by knowledge; it must get more and more to a right and luminously informed action before it can be converted into the divine kinetic will. That again means

⁴ This is from the point of view of our nature ascending upwards by self-conquest, effort and discipline. There must also intervene more and more a descent of the divine Light, Presence and Power into the being to transform it; otherwise the change at the point of culmination and beyond it cannot take place. That is why there comes in as the last movement the necessity of an absolute self-surrender.

the necessity of the intervention of sattwa. The sattwic quality is a first mediator between the higher and the lower nature. It must indeed at a certain point transform or escape from itself and break up and dissolve into its source; its conditioned derivative seeking light and carefully constructed action must change into the free direct dynamics and spontaneous light of the spirit. But meanwhile a high increase of sattwic power delivers us largely from the tamasic and the rajasic disqualification; and its own disqualification, once we are not pulled too much downward by rajas and tama, can be surmounted with a greater ease. To develop sattwa till it becomes full of spiritual light and calm and happiness is the first condition of this preparatory discipline of the nature.

That, we shall find, is the whole intention of the remaining chapters of the Gita. But first it prefaces the consideration of this enlightening movement by a distinction between two kinds of being, the Deva and the Asura; for the Deva is capable of a high self-transforming sattwic action, the Asura incapable. We must see what is the object of this preface and the precise bearing of this distinction. The general nature of all human beings is the same, it is a mixture of the three gunas; it would seem then that in all there must be the capacity to develop and strengthen the sattwic element and turn it upward towards the heights of the divine transformation. That our ordinary turn is actually towards making our reason and will the servants of our rajasic or tamasic egoism, the ministers of our restless and ill-balanced kinetic desire or our self-indulgent indolence and static inertia, can only be, one would imagine, a temporary characteristic of our undeveloped spiritual being, a rawness of its imperfect evolution and must disappear when our consciousness rises in the spiritual scale. But we actually see that men, at least men above a certain level, fall very largely into two classes, those who have a dominant force of sattwic nature turned towards knowledge, self-control, beneficence, perfection and those who have a dominant force of rajasic nature turned towards egoistic greatness, satisfaction of desire, the indulgence of their own strong will and personality which they seek to impose on the

world, not for the service of man or God, but for their own pride, glory and pleasure. These are the human representatives of the Devas and Danavas or Asuras, the Gods and the Titans. This distinction is a very ancient one in Indian religious symbolism. The fundamental idea of the Rig Veda is a struggle between the Gods and their dark opponents, between the Masters of Light, sons of Infinity, and the children of Division and Night, a battle in which man takes part and which is reflected in all his inner life and action. This was also a fundamental principle of the religion of Zoroaster. The same idea is prominent in later literature. The Ramayana is in its ethical intention the parable of an enormous conflict between the Deva in human form and the incarnate Rakshasa, between the representative of a high culture and Dharma and a huge unbridled force and gigantic civilisation of the exaggerated Ego. The Mahabharata, of which the Gita is a section, takes for its subject a lifelong clash between human Devas and Asuras, the men of power, sons of the Gods, who are governed by the light of a high ethical Dharma and others who are embodied Titans, the men of power who are out for the service of their intellectual, vital and physical ego. The ancient mind, more open than ours to the truth of things behind the physical veil, saw behind the life of man great cosmic Powers or beings representative of certain turns or grades of the universal Shakti, divine, titanic, gigantic, demoniac, and men who strongly represented in themselves these types of nature were themselves considered as Devas, Asuras, Rakshasas, Pisachas. The Gita for its own purposes takes up this distinction and develops the difference between these two kinds of beings, *dvau bhūtasargau*. It has spoken previously of the nature which is Asuric and Rakshasic and obstructs God-knowledge, salvation and perfection; it now contrasts it with the Daivic nature which is turned to these things.

Arjuna, says the Teacher, is of the Deva nature. He need not grieve with the thought that by acceptance of battle and slaughter he will be yielding to the impulses of the Asura. The action on which all turns, the battle which Arjuna has to fight with the incarnate Godhead as his charioteer at the bidding of

the Master of the world in the form of the Time-Spirit, is a struggle to establish the kingdom of the Dharma, the empire of Truth, Right and Justice. He himself is born in the Deva kind; he has developed in himself the sattwic being, until he has now come to a point at which he is capable of a high transformation and liberation from the *traigunya* and therefore even from the sattwic nature. The distinction between the Deva and the Asura is not comprehensive of all humanity, not rigidly applicable to all its individuals, neither is it sharp and definite in all stages of the moral or spiritual history of the race or in all phases of the individual evolution. The tamasic man who makes so large a part of the whole, falls into neither category as it is here described, though he may have both elements in him in a low degree and for the most part serves tepidly the lower qualities. The normal man is ordinarily a mixture; but one or the other tendency is more pronounced, tends to make him predominantly rajaso-tamasic or sattwo-rajasic and can be said to be preparing him for either culmination, for the divine clarity or the titanic turbulence. For here what is in question is a certain culmination in the evolution of the qualitative nature, as will be evident from the descriptions given in the text. On one side there can be a sublimation of the sattwic quality, the culmination or manifestation of the unborn Deva, on the other a sublimation of the rajasic turn of the soul in nature, the entire birth of the Asura. The one leads towards that movement of liberation on which the Gita is about to lay stress; it makes possible a high self-exceeding of the sattwa quality and a transformation into the likeness of the divine being, *vimokṣaya*. The other leads away from that universal potentiality and precipitates towards an exaggeration of our bondage to the ego. This is the point of the distinction.

The Deva nature is distinguished by an acme of the sattwic habits and qualities; self-control, sacrifice, the religious habit, cleanliness and purity, candour and straightforwardness, truth, calm and self-denial, compassion to all beings, modesty, gentleness, forgivingness, patience, steadfastness, a deep sweet and serious freedom from all restlessness, levity and inconstancy are its native attributes. The Asuric qualities, wrath, greed, cunning,

treachery, wilful doing of injury to others, pride and arrogance and excessive self-esteem have no place in its composition. But its gentleness and self-denial and self-control are free too from all weakness: it has energy and soul force, strong resolution, the fearlessness of the soul that lives in the right and according to the truth as well as its harmlessness, *tejah*, *abhayam*, *dhrtih*, *ahimsā*, *satyam*. The whole being, the whole temperament is integrally pure; there is a seeking for knowledge and a calm and fixed abiding in knowledge. This is the wealth, the plenitude of the man born into the Deva nature.

The Asuric nature has too its wealth, its plenitude of force, but it is of a very different, a powerful and evil kind. Asuric men have no true knowledge of the way of action or the way of abstention, the fulfilling or the holding in of the nature. Truth is not in them, nor clean doing, nor faithful observance. They see naturally in the world nothing but a huge play of the satisfaction of self; theirs is a world with Desire for its cause and seed and governing force and law, a world of Chance, a world devoid of just relation and linked Karma, a world without God, not true, not founded in Truth. Whatever better intellectual or higher religious dogma they may possess, this alone is the true creed of their mind and will in action; they follow always the cult of Desire and Ego. On that way of seeing life they lean in reality and by its falsehood they ruin their souls and their reason. The Asuric man becomes the centre or instrument of a fierce, Titanic, violent action, a power of destruction in the world, a fount of injury and evil. Arrogant, full of self-esteem and the drunkenness of their pride, these misguided souls delude themselves, persist in false and obstinate aims and pursue the fixed impure resolution of their longings. They imagine that desire and enjoyment are all the aim of life and in their inordinate and insatiable pursuit of it they are the prey of a devouring, a measurelessly unceasing care and thought and endeavour and anxiety till the moment of their death. Bound by a hundred bonds, devoured by wrath and lust, unweariedly occupied in amassing unjust gains which may serve their enjoyment and the satisfaction of their craving, always they think, "Today I have gained this object of desire, tomorrow I

shall have that other; today I have so much wealth, more I will get tomorrow. I have killed this my enemy, the rest too I will kill. I am a lord and king of men, I am perfect, accomplished, strong, happy, fortunate, a privileged enjoyer of the world; I am wealthy, I am of high birth; who is there like unto me? I will sacrifice, I will give, I will enjoy." Thus occupied by many egoistic ideas, deluded, doing works, but doing them wrongly, acting mightily, but for themselves, for desire, for enjoyment, not for God in themselves and God in man, they fall into the unclean hell of their own evil. They sacrifice and give, but from a self-regarding ostentation, from vanity and with a stiff and foolish pride. In the egoism of their strength and power, in the violence of their wrath and arrogance they hate, despise and belittle the God hidden in themselves and the God in man. And because they have this proud hatred and contempt of good and of God, because they are cruel and evil, the Divine casts them down continually into more and more Asuric births. Not seeking him, they find him not, and at last, losing the way to him altogether, sink down into the lowest status of soul-nature, *adhamām gatim*.

This graphic description, even giving its entire value to the distinction it implies, must not be pressed to carry more in it than it means. When it is said that there are two creations of beings in this material world, Deva and Asura,⁵ it is not meant that human souls are so created by God from the beginning each with its own inevitable career in Nature, nor is it meant that there is a rigid spiritual predestination and those rejected from the beginning by the Divine are blinded by him so that they may be thrust down to eternal perdition and the impurity of Hell. All souls are eternal portions of the Divine, the Asura as well as the Deva, all can come to salvation: even the greatest sinner can turn to the Divine. But the evolution of the soul in Nature

⁵ The distinction between the two creations has its full truth in supraphysical planes where the law of spiritual evolution does not govern the movement. There are worlds of the Devas, worlds of the Asuras, and there are in these worlds behind us constant types of beings which support the complex divine play of creation indispensable to the march of the universe and cast their influence also on the earth and on the life and nature of man in this physical plane of existence.

is an adventure of which Swabhava and the Karma governed by the swabhava are ever the chief powers; and if an excess in the manifestation of the swabhava, the self-becoming of the soul, a disorder in its play turns the law of being to the perverse side, if the rajasic qualities are given the upper hand, cultured to the diminution of sattwa, then the trend of Karma and its results necessarily culminate not in the sattwic height which is capable of the movement of liberation, but in the highest exaggeration of the perversities of the lower nature. The man, if he does not stop short and abandon his way of error, has eventually the Asura full-born in him, and once he has taken that enormous turn away from the Light and Truth, he can no more reverse the fatal speed of his course because of the very immensity of the misused divine power in him until he has plumbed the depths to which it falls, found bottom and seen where the way has led him, the power exhausted and misspent, himself down in the lowest state of the soul nature, which is Hell. Only when he understands and turns to the Light, does that other truth of the Gita come in, that even the greatest sinner, the most impure and violent evil-doer is saved the moment he turns to adore and follow after the Godhead within him. Then, simply by that turn, he gets very soon into the sattwic way which leads to perfection and freedom.

The Asuric Prakriti is the rajasic at its height; it leads to the slavery of the soul in Nature, to desire, wrath and greed, the three powers of the rajasic ego, and these are the three-fold doors of Hell, the Hell into which the natural being falls when it indulges the impurity and evil and error of its lower or perverted instincts. These three are again the doors of a great darkness, they fold back into tamas, the characteristic power of the original Ignorance; for the unbridled force of the rajasic nature, when exhausted, falls back into the weakness, collapse, darkness, incapacity of the worst tamasic soul-status. To escape from this downfall one must get rid of these three evil forces and turn to the light of the sattwic quality, live by the right, in the true relations, according to the Truth and the Law; then one follows one's own higher good and arrives at the highest soul-

status. To follow the law of desire is not the true rule of our nature; there is a higher and juster standard of its works. But where is it embodied or how is it to be found? In the first place, the human race has always been seeking for this just and high Law and whatever it has discovered is embodied in its Shastra, its rule of science and knowledge, rule of ethics, rule of religion, rule of best social living, rule of one's right relations with man and God and Nature. Shastra does not mean a mass of customs, some good, some bad, unintelligently followed by the customary routine mind of the tamasic man. Shastra is the knowledge and teaching laid down by intuition, experience and wisdom, the science and art and ethic of life, the best standards available to the race. The half-awakened man who leaves the observance of its rule to follow the guidance of his instincts and desires, can get pleasure but not happiness; for the inner happiness can only come by right living. He cannot move to perfection, cannot acquire the highest spiritual status. The law of instinct and desire seems to come first in the animal world, but the manhood of man grows by the pursuit of truth and religion and knowledge and a right life. The Shastra, the recognised Right that he has set up to govern his lower members by his reason and intelligent will, must therefore first be observed and made the authority for conduct and works and for what should or should not be done, till the instinctive desire nature is schooled and abated and put down by the habit of self-control and man is ready first for a freer intelligent self-guidance and then for the highest supreme law and supreme liberty of the spiritual nature.

For the Shastra in its ordinary aspect is not that spiritual law, although at its loftiest point, when it becomes a science and art of spiritual living, Adhyatma-shastra,—the Gita itself describes its own teaching as the highest and most secret Shastra,—it formulates a rule of the self-transcendence of the sattwic nature and develops the discipline which leads to spiritual transmutation. Yet all Shastra is built on a number of preparatory conditions, dharmas; it is a means, not an end. The supreme end is the freedom of the spirit when abandoning all dharmas the soul turns to God for its sole law of action, acts straight from the

divine will and lives in the freedom of the divine nature, not in the Law, but in the Spirit. This is the development of the teaching which is prepared by the next question of Arjuna.

XVIII

The Gunas, Faith and Works¹

THE GITA has made a distinction between action according to the licence of personal desire and action done according to the Shastra. We must understand by the latter the recognised science and art of life which is the outcome of mankind's collective living, its culture, religion, science, its progressive discovery of the best rule of life,—but mankind still walking in the ignorance and proceeding in a half light towards knowledge. The action of personal desire belongs to the unregenerated state of our nature and is dictated by ignorance or false knowledge and an unregulated or ill-regulated kinetic or rajasic egoism. The action controlled by Shastra is an outcome of intellectual, ethical, aesthetic, social and religious culture; it embodies an attempt at a certain right living, harmony and right order and is evidently an effort, more or less advanced according to circumstances, of the sattvic element in man to overtop, regulate and control or guide, where it must be admitted, his rajasic and tamasic egoism. It is the means to a step in advance, and therefore mankind must first proceed through it and make this Shastra its law of action rather than obey the impulsion of its personal desires. This is a general rule which humanity has always recognised wherever it has arrived at any kind of established and developed society; it has an idea of an order, a law, a standard of its perfection, something other than the guidance of its desires or the crude direction of its raw impulses. This greater rule the individual finds usually outside himself in some more or less fixed outcome of the experience and wisdom of the race, which he accepts, to which his mind and the leading parts of his being give their assent or sanction and which he tries to make his own by living it in his mind, will and action.

¹ Gita, XVII.

And this assent of the being, its conscious acceptance and will to believe and realise, may be called by the name which the Gita gives to it, his faith, *śraddhā*. The religion, the philosophy, the ethical law, the social idea, the cultural idea in which I put my faith, gives me a law for my nature and its works, an idea of relative right or an idea of relative or absolute perfection and in proportion as I have a sincerity and completeness of faith in it and an intensity of will to live according to that faith, I can become what it proposes to me, I can shape myself into an image of that right or an exemplar of that perfection.

But we see also that there is a freer tendency in man other than the leading of his desires and other than his will to accept the Law, the fixed idea, the safe governing rule of the Shastra. The individual frequently enough, the community at any moment of its life is seen to turn away from the Shastra, becomes impatient of it, loses that form of its will and faith and goes in search of another law which it is now more disposed to accept as the right rule of living and regard as a more vital or higher truth of existence. This may happen when the established Shastra ceases to be a living thing and degenerates or stiffens into a mass of customs and conventions. Or it may come because it is found that the Shastra is imperfect or no longer useful for the progress demanded; a new truth, a more perfect law of living has become imperative. If that does not exist, it has to be discovered by the effort of the race or by some great and illumined individual mind who embodies the desire and seeking of the race. The Vedic law becomes a convention and a Buddha appears with his new rule of the eightfold path and the goal of Nirvana; and it may be remarked that he propounds it not as a personal invention, but as the true rule of Aryan living constantly rediscovered by the Buddha, the enlightened mind, the awakened spirit. But this practically means that there is an ideal, an eternal Dharma which religion, philosophy, ethics and all other powers in man that strive after truth and perfection are constantly endeavouring to embody in new statements of the science and art of the inner and outer life, a new Shastra. The Mosaic law of religious, ethical and social righteousness is

convicted of narrowness and imperfection and is now besides a convention; the law of Christ comes to replace it and claims at once to abrogate and to fulfil, to abrogate the imperfect form and fulfil in a deeper and broader light and power the spirit of the thing which it aimed at, the divine rule of living. And the human search does not stop there, but leaves these formulations too, goes back to some past truth it had rejected or breaks forward to some new truth and power, but is always in search of the same thing, the law of its perfection, its rule of right living, its complete, highest and essential self and nature.

This movement begins with the individual, who is no longer satisfied with the law because he finds that it no longer corresponds to his idea and largest or intensest experience of himself and existence and therefore he can no longer bring to it the will to believe and practise. It does not correspond to his inner way of being, it is not to him *sat*, the thing that truly is, the right, the highest or best or real good; it is not the truth and law of his or of all being. The Shastra is something impersonal to the individual, and that gives it its authority over the narrow personal law of his members; but at the same time it is personal to the collectivity and is the outcome of its experience, its culture or its nature. It is not in all its form and spirit the ideal rule of fulfilment of the Self or the eternal law of the Master of our nature, although it may contain in itself in small or larger measure indications, preparations, illuminating glimpses of that far greater thing. And the individual may have gone beyond the collectivity and be ready for a greater truth, a wider walk, a deeper intention of the Life-Spirit. The leading in him that departs from the Shastra may not indeed be always a higher movement; it may take the form of a revolt of the egoistic or rajasic nature seeking freedom from the yoke of something which it feels to be cramping to its liberty of self-fulfilment and self-finding. But even then it is often justified by some narrowness or imperfection of the Shastra or by the degradation of the current rule of living into a merely restricting or lifeless convention. And so far it is legitimate, it appeals to a truth, it has a good and just reason for existence: for though it misses the right path, yet the free action of the rajasic

ego, because it has more in it of liberty and life, is better than the dead and hidebound tamasic following of a convention. The rajasic is always stronger, always more forcefully inspired and has more possibilities in it than the tamasic nature. But also this leading may be sattvic at its heart; it may be a turn to a larger and greater ideal which will carry us nearer to a more complete and ample truth of our self and universal existence than has yet been seen and nearer therefore to that highest law which is one with the divine freedom. And in effect this movement is usually an attempt to lay hold on some forgotten truth or to move on to a yet undiscovered or unlived truth of our being. It is not a mere licentious movement of the unregulated nature; it has its spiritual justification and is a necessity of our spiritual progress. And even if the Shastra is still a living thing and the best rule for the human average, the exceptional man, spiritual, inwardly developed, is not bound by that standard. He is called upon to go beyond the fixed line of the Shastra. For this is a rule for the guidance, control and relative perfection of the normal imperfect man and he has to go on to a more absolute perfection: this is a system of fixed dharmas and he has to learn to live in the liberty of the Spirit.

But what then shall be the secure base of an action which departs both from the guidance of desire and from the normal law? For the rule of desire has an authority of its own, no longer safe or satisfactory to us as it is to the animal or as it might have been to a primitive humanity, but still, so far as it goes, founded on a very living part of our nature and fortified by its strong indications; and the law, the Shastra has behind it all the authority of long established rule, old successful sanctions and a secure past experience. But this new movement is of the nature of a powerful adventure into the unknown or partly known, a daring development and a new conquest, and what then is the clue to be followed, the guiding light on which it can depend or its strong basis in our being? The answer is that the clue and support is to be found in man's *śraddhā*, his faith, his will to believe, to live what he sees or thinks to be the truth of himself and of existence. In other words this movement is man's appeal

to himself or to something potent and compelling in himself or in universal existence for the discovery of his truth, his law of living, his way to fullness and perfection. And everything depends on the nature of his faith, the thing in himself or in the universal soul — of which he is a portion or manifestation — to which he directs it and on how near he gets by it to his real self and the Self or true being of the universe. If he is tamasic, obscure, clouded, if he has an ignorant faith, an inept will, he will reach nothing true and will fall away to his lower nature. If he is lured by false rajasic lights, he can be carried away by self-will into bypaths that may lead to morass or precipice. In either case his only chance of salvation lies in a return of sattwa upon him to impose a new enlightened order and rule upon his members which will liberate him from the violent error of his self-will or the dull error of his clouded ignorance. If on the other hand he has the sattwic nature and a sattwic faith and direction for his steps, he will arrive in sight of a higher yet unachieved ideal rule which may lead him even in rare instances beyond the sattwic light some way at least towards a highest divine illumination and divine way of being and living. For if the sattwic light is so strong in him as to bring him to its own culminating point, then he will be able advancing from that point to make out his gate of entrance into some first ray of that which is divine, transcendent and absolute. In all effort at self-finding these possibilities are there; they are the conditions of this spiritual adventure.

Now we have to see how the Gita deals with this question on its own line of spiritual teaching and self-discipline. For Arjuna puts immediately a suggestive query from which the problem or one aspect of it arises. When men, he says, sacrifice to God or the gods with faith, *śraddhā*, but abandon the rule of the Shastra, what is that concentrated will of devotion in them, *nīṣṭhā*, which gives them this faith and moves them to this kind of action? Is it sattwa, rajas or tamas? to which strand of our nature does it belong? The answer of the Gita first states the principle that the faith in us is of a triple kind like all things in Nature and varies according to the dominating quality of our nature. The faith of each man takes the shape, hue, quality given to it by his

stuff of being, his constituting temperament, his innate power of existence, *sattvānurūpā sarvasya śraddhā*. And then there comes a remarkable line in which the Gita tells us that this Purusha, this soul in man, is, as it were, made of *śraddhā*, a faith, a will to be, a belief in itself and existence, and whatever is that will, faith or constituting belief in him, he is that and that is he. *Śraddhāmayaḥ yam puruṣo yo yac-chraddhah sa eva saḥ*. If we look into this pregnant saying a little closely, we shall find that this single line contains implied in its few forceful words almost the whole theory of the modern gospel of pragmatism. For if a man or the soul in a man consists of the faith which is in him, taken in this deeper sense, then it follows that the truth which he sees and wills to live is for him the truth of his being, the truth of himself that he has created or is creating and there can be for him no other real truth. This truth is a thing of his inner and outer action, a thing of his becoming, of the soul's dynamics, not of that in him which never changes. He is what he is today by some past will of his nature sustained and continued by a present will to know, to believe and to be in his intelligence and vital force, and whatever new turn is taken by this will and faith active in his very substance, that he will tend to become in the future. We create our own truth of existence in our own action of mind and life, which is another way of saying that we create our own selves, are our own makers.

But very obviously this is only one aspect of the truth, and all one-aspected statements are suspect to the thinker. Truth is not merely whatever our own personality is or creates; that is only the truth of our becoming, one point or line of emphasis in a movement of widest volume. Beyond our personality there is, first, a universal being as well as a universal becoming of which ours is a little movement; and beyond that too there is the eternal Being out of which all becoming derives and to which it owes its potentialities, elements, original and final motives. We may say indeed that all becoming is only an act of universal consciousness, is Maya, is a creation of the will to become, and the only other reality, if there is any, is a pure eternal existence beyond consciousness, featureless, unexpressed and

inexpressible. That is practically the standpoint taken by the Mayavadin's Adwaita and the sense of the distinction he makes between pragmatic truth which to his mind is illusory or at least only temporarily and partly real—while modern pragmatism takes it to be the true truth or at least the only recognisable reality because the only reality that we can act and know,—between that pragmatic illusion and on the other side of creative Maya the lonely Absolute featureless and inexpressible. But for the Gita absolute Brahman is also supreme Purusha, and Purusha is always conscious Soul, though its highest consciousness, its superconsciousness, if we will,—as, one may add, its lowest which we call the Inconscient,—is something very different from our mind consciousness to which alone we are accustomed to give the name. There is in that highest superconsciousness a highest truth and dharma of immortality, a greatest divine way of being, a way of the eternal and infinite. That eternal way of existence and divine manner of being exists already in the eternity of the Purushottama, but we are now attempting to create it here too in our becoming by Yoga; our endeavour is to become the Divine, to be as He, *madbhāva*. That also depends on *śraddhā*. It is by an act of our conscious substance and a belief in its truth, an inmost will to live it or be it that we come by it; but this does not mean that it does not already exist beyond us. Though it may not exist for our outward mind until we see and create ourselves anew into it, it is still there in the Eternal and we may say even that it is already there in our own secret self; for in us also, in our depths the Purushottama always is. Our growing into that, our creation of it is his and its manifestation in us. All creation indeed since it proceeds from the conscious substance of the Eternal, is a manifestation of him and proceeds by a faith, acceptance, will to be in the originating consciousness, Chit-Shakti.

We are concerned at present, however, not with the metaphysical issue, but with the relation of this will or faith in our being to our possibility of growth into the perfection of the divine nature. This power, this *śraddhā* is in any case our basis. When we live, when we are and do according to our desires, that

is a persistent act of *śraddhā* belonging mostly to our vital and physical, our tamasic and rajasic nature. And when we try to be, to live and to do according to the Shastra, we proceed by a persistent act of *śraddhā* which belongs, supposing it to be not a routine faith, to a sattwic tendency that is constantly labouring to impose itself on our rajasic and tamasic parts. When we leave both these things and try to be, to live and to do according to some ideal or novel conception of truth of our own finding or our own individual acceptance, that too is a persistent act of *śraddhā* which may be dominated by any one of these three qualities that constantly govern our every thought, will, feeling and act. And again when we try to be, to live and to do according to the divine nature, then too we must proceed by a persistent act of *śraddhā*, which must be according to the Gita the faith of the sattwic nature when it culminates and is preparing to exceed its own clear-cut limits. But all and any of these things implies some kinesis or displacement of nature, all suppose an inner or outer or ordinarily both an inner and an outer action. And what then will be the character of this action? The Gita states three main elements of the work we have to do, *kartavyam karma*, and these three are sacrifice, giving and askesis. For when questioned by Arjuna on the difference between the outer and inner renunciation, *sannyāsa* and *tyāga*, Krishna insists that these three things ought not to be renounced at all but ought altogether to be done, for they are the work before us, *kartavyam karma*, and they purify the wise. In other words these acts constitute the means of our perfection. But at the same time they may be done unwisely or less wisely by the unwise. All dynamic action may be reduced in its essential parts to these three elements. For all dynamic action, all kinesis of the nature involves a voluntary or an involuntary tapasya or askesis, an energism and concentration of our forces or capacities or of some capacity which helps us to achieve, to acquire or to become something, *tapas*. All action involves a giving of what we are or have, an expenditure which is the price of that achievement, acquisition or becoming, *dāna*. All action involves too a sacrifice to elemental or to universal powers or to the supreme Master of our works. The question

is whether we do these things unconsciously, passively, or at best with an unintelligent ignorant half-conscious will, or with an unwisely or perversely conscient energism, or with a wisely conscient will rooted in knowledge, in other words, whether our sacrifice, giving and askesis are tamasic, rajasic or sattvic in nature.

For everything here, including physical things, partakes of this triple character. Our food, for example, the Gita tells us, is either sattvic, rajasic or tamasic according to its character and effect on the body. The sattvic temperament in the mental and physical body turns naturally to the things that increase the life, increase the inner and outer strength, nourish at once the mental, vital and physical force and increase the pleasure and satisfaction and happy condition of mind and life and body, all that is succulent and soft and firm and satisfying. The rajasic temperament prefers naturally food that is violently sour, pungent, hot, acrid, rough and strong and burning, the aliments that increase ill-health and the distempers of the mind and body. The tamasic temperament takes a perverse pleasure in cold, impure, stale, rotten or tasteless food or even accepts like the animals the remnants half-eaten by others. All-pervading is the principle of the three gunas. The gunas apply at the other end in the same way to the things of the mind and spirit, to sacrifice, giving and askesis, and the Gita distinguishes under each of these three heads between the three kinds in the customary terms of these things as they were formulated by the symbolism of the old Indian culture. But, remembering the very wide sense which the Gita itself gives to the idea of sacrifice, we may well enlarge the surface meaning of these hints and open them to a freer significance. And it will be convenient to take them in the reverse order, from tamas to sattwa, since we are considering how we go upward out of our lower nature through a certain sattvic culmination and self-exceeding to a divine nature and action beyond the three gunas.

The tamasic sacrifice is work which is done without faith, without, that is to say, any full conscious idea and acceptance and will towards the thing Nature yet compels us to execute. It is

done mechanically, because the act of living demands it, because it comes in our way, because others do it, to avoid some other greater difficulty which may arise from not doing it, or from any other tamasic motive. And it is apt to be done, if we have in the full this kind of temperament, carelessly, perfunctorily, in the wrong way. It will not be performed by the *vidhi* or right rule of the Shastra, will not be led in its steps according to the right method laid down by the art and science of life and the true science of the thing to be done. There will be no giving of food in the sacrifice,—and that act in the Indian ritual is symbolic of the element of helpful giving inherent in every action that is real sacrifice, the indispensable giving to others, the fruitful help to others, to the world, without which our action becomes a wholly self-regarding thing and a violation of the true universal law of solidarity and interchange. The work will be done without the dakshina, the much-needed giving or self-giving to the leaders of the sacrificial action, whether to the outward guide and helper of our work or to the veiled or manifest godhead within us. It will be done without the mantra, without the dedicating thought which is the sacred body of our will and knowledge lifted upwards to the godheads we serve by our sacrifice. The tamasic man does not offer his sacrifice to the gods, but to inferior elemental powers or to those grosser spirits behind the veil who feed upon his works and dominate his life with their darkness.

The rajasic man offers his sacrifice to lower godheads or to perverse powers, the Yakshas, the keepers of wealth, or to the Asuric and the Rakshasic forces. His sacrifice may be performed outwardly according to the Shastra, but its motive is ostentation, pride or a strong lust after the fruit of his action, a vehement demand for the reward of his works. All work therefore that proceeds from violent or egoistic personal desire or from an arrogant will intent to impose itself on the world for personal objects is of the rajasic nature, even if it mask itself with the insignia of the light, even if it be done outwardly as a sacrifice. Although it is ostensibly given to God or to the gods, it remains essentially an Asuric action. It is the inner state, motive and

direction which give their value to our works, and not merely the apparent outer direction, the divine names we may call to sanction them or even the sincere intellectual belief which seems to justify us in the performance. Wherever there is a dominating egoism in our acts, there our work becomes a rajasic sacrifice. The true sattwic sacrifice on the other hand is distinguished by three signs that are the quiet seal of its character. First, it is dictated by the effective truth, executed according to the *vidhi*, the right principle, the exact method and rule, the just rhythm and law of our works, their true functioning, their dharma; that means that the reason and enlightened will are the guides and determinants of their steps and their purpose. Secondly, it is executed with a mind concentrated and fixed on the idea of the thing to be done as a true sacrifice imposed on us by the divine law that governs our life and therefore performed out of a high inner obligation or imperative truth and without desire for the personal fruit,—the more impersonal the motive of the action and the temperament of the force put out in it, the more sattwic is its nature. And finally it is offered to the gods without any reservation; it is acceptable to the divine powers by whom—for they are his masks and personalities—the Master of existence governs the universe.

This sattwic sacrifice comes then very near to the ideal and leads directly towards the kind of action demanded by the Gita; but it is not the last and highest ideal, it is not yet the action of the perfected man who lives in the divine nature. For it is carried out as a fixed dharma, and it is offered as a sacrifice or service to the gods, to some partial power or aspect of the Divine manifested in ourselves or in the universe. Work done with a disinterested religious faith or selflessly for humanity or impersonally from devotion to the Right or the Truth is of this nature, and action of that kind is necessary for our perfection; for it purifies our thought and will and our natural substance. The culmination of the sattwic action at which we have to arrive is of a still larger and freer kind; it is the high last sacrifice offered by us to the supreme Divine in his integral being and with a seeking for the Purushottama or with the vision of Vasudeva in all that

is, the action done impersonally, universally, for the good of the world, for the fulfilment of the divine will in the universe. That culmination leads to its own transcending, to the immortal Dharma. For then comes a freedom in which there is no personal action at all, no sattwic rule of dharma, no limitation of Shastra; the inferior reason and will are themselves overpassed and it is not they but a higher wisdom that dictates and guides the work and commands its objective. There is no question of personal fruit; for the will that works is not our own but a supreme Will of which the soul is the instrument. There is no self-regarding and no selflessness; for the Jiva, the eternal portion of the Divine, is united with the highest Self of his existence and he and all are one in that Self and Spirit. There is no personal action, for all actions are given up to the Master of our works and it is he that does the action through the divinised Prakriti. There is no sacrifice,—unless we can say that the Master of sacrifice is offering the works of his energy in the Jiva to himself in his own cosmic form. This is the supreme self-surpassing state arrived at by the action that is sacrifice, this the perfection of the soul that has come to its full consciousness in the divine nature.

Tamasic tapasya is that which is pursued under a clouded and deluded idea hard and obstinate in its delusion, maintained by an ignorant faith in some cherished falsehood, performed with effort and suffering imposed on oneself in pursuit of some narrow and vulgar egoistic object empty of relation to any true or great aim or else with a concentration of the energy in a will to do hurt to others. That which makes this kind of energism tamasic is not any principle of inertia, for inertia is foreign to tapasya, but a darkness in the mind and nature, a vulgar narrowness and ugliness in the doing or a brutish instinct or desire in the aim or in the motive feeling. Rajasic energisms of askesis are those which are undertaken to get honour and worship from men, for the sake of personal distinction and outward glory and greatness or from some other of the many motives of egoistic will and pride. This kind of askesis is devoted to fleeting particular objects which add nothing to the heavenward growth and perfection of the soul; it is a thing without fixed

and helpful principle, an energy bound up with changeful and passing occasion and itself of that nature. Or even if there is ostensibly a more inward and noble object and the faith and will are of a higher kind, yet if any kind of arrogance or pride or any great strength of violent self-will or desire enters into the askesis or if it drives some violent, lawless or terrible action contrary to the Shastra, opposed to the right rule of life and works and afflicting to oneself and to others, or if it is of the nature of self-torture and hurts the mental, vital and physical elements or violates the God within us who is seated in the inner subtle body, then too it is an unwise, an Asuric, a rajasic or rajo-tamasic tapasya.

Sattwic tapasya is that which is done with a highest enlightened faith, as a duty deeply accepted or for some ethical or spiritual or other higher reason and with no desire for any external or narrowly personal fruit in the action. It is of the character of self-discipline and asks for self-control and a harmonising of one's nature. The Gita describes three kinds of sattwic askesis. First comes the physical, the askesis of the outward act; under this head are especially mentioned worship and reverence of those deserving reverence, cleanliness of the person, the action and the life, candid dealing, sexual purity and avoidance of killing and injury to others. Next is askesis of speech, and that consists in the study of Scripture, kind, true and beneficent speech and a careful avoidance of words that may cause fear, sorrow and trouble to others. Finally there is the askesis of mental and moral perfection, and that means the purifying of the whole temperament, gentleness and a clear and calm gladness of mind, self-control and silence. Here comes in all that quiets or disciplines the rajasic and egoistic nature and all that replaces it by the happy and tranquil principle of good and virtue. This is the askesis of the sattwic dharma so highly prized in the system of the ancient Indian culture. Its greater culmination will be a high purity of the reason and will, an equal soul, a deep peace and calm, a wide sympathy and preparation of oneness, a reflection of the inner soul's divine gladness in the mind, life and body. There at that lofty point the ethical is already passing away

into the spiritual type and character. And this culmination too can be made to transcend itself, can be raised into a higher and freer light, can pass away into the settled godlike energy of the supreme nature. And what will remain then will be the spirit's immaculate Tapas, a highest will and luminous force in all the members acting in a wide and solid calm and a deep and pure spiritual delight, Ananda. There will then be no farther need of askesis, no tapasya, because all is naturally and easily divine, all is that Tapas. There will be no separate labour of the lower energism, because the energy of Prakriti will have found its true source and base in the transcendent will of the Purushottama. Then, because of this high initiation, the acts of this energy on the lower planes also will proceed naturally and spontaneously from an innate perfect will and by an inherent perfect guidance. There will be no limitation by any of the present dharmas; for there will be a free action far above the rajasic and tamasic nature, but also far beyond the too careful and narrow limits of the sattwic rule of action.

As with tapasya, all giving also is of an ignorant tamasic, an ostentatious rajasic or a disinterested and enlightened sattwic character. The tamasic gift is offered ignorantly with no consideration of the right conditions of time, place and object; it is a foolish, inconsiderate and in reality a self-regarding movement, an ungenerous and ignoble generosity, the gift offered without sympathy or true liberality, without regard for the feelings of the recipient and despised by him even in the acceptance. The rajasic kind of giving is that which is done with regret, unwillingness or violence to oneself or with a personal and egoistic object or in the hope of a return of some kind from whatever quarter or a corresponding or greater benefit to oneself from the receiver. The sattwic way of giving is to bestow with right reason and goodwill and sympathy in the right conditions of time and place and on the right recipient who is worthy or to whom the gift can be really helpful. Its act is performed for the sake of the giving and the beneficence, without any view to a benefit already done or yet to be done to oneself by the receiver of the benefit and without any personal object in the action.

The culmination of the sattwic way of *dāna* will bring into the action an increasing element of that wide self-giving to others and to the world and to God, *ātma-dāna*, *ātma-samarpana*, which is the high consecration of the sacrifice of works enjoined by the Gita. And the transcendence in the divine nature will be a greatest completeness of self-offering founded on the largest meaning of existence. All this manifold universe comes into birth and is constantly maintained by God's giving of himself and his powers and the lavish outflow of his self and spirit into all these existences; universal being, says the Veda, is the sacrifice of the Purusha. All the action of the perfected soul will be even such a constant divine giving of itself and its powers, an outflowing of the knowledge, light, strength, love, joy, helpful shakti which it possesses in the Divine and by his influence and effluence on all around it according to their capacity of reception or on all this world and its creatures. That will be the complete result of the complete self-giving of the soul to the Master of our existence.

The Gita closes this chapter with what seems at first sight a recondite utterance. The formula OM, Tat, Sat, is, it says, the triple definition of the Brahman, by whom the Brahmanas, the Vedas and sacrifices were created of old and in it resides all their significance. Tat, That, indicates the Absolute. Sat indicates the supreme and universal existence in its principle. OM is the symbol of the triple Brahman, the outward-looking, the inward or subtle and the superconscious causal Purusha. Each letter A, U, M indicates one of these three in ascending order and the syllable as a whole brings out the fourth state, Turiya, which rises to the Absolute. OM is the initiating syllable pronounced at the outset as a benedictory prelude and sanction to all act of sacrifice, all act of giving and all act of askesis; it is a reminder that our work should be made an expression of the triple Divine in our inner being and turned towards him in the idea and motive. The seekers of liberation indeed do these actions without desire of fruit and only with the idea, feeling, Ananda of the absolute Divine behind their nature. It is that which they seek by this purity and impersonality in their works, this high desirelessness, this vast emptiness of ego and plenitude of Spirit. Sat means

good and it means existence. Both these things, the principle of good and the principle of reality, must be there behind all the three kinds of action. All good works are Sat, for they prepare the soul for the higher reality of our being; all firm abiding in sacrifice, giving and askesis and all works done with that central view, as sacrifice, as giving, as askesis, are Sat, for they build the basis for the highest truth of our spirit. And because *śraddhā* is the central principle of our existence, any of these things done without *śraddhā* is a falsity and has no true meaning or true substance on earth or beyond, no reality, no power to endure or create in life here or after the mortal life in greater regions of our conscious spirit. The soul's faith, not a mere intellectual belief, but its concordant will to know, to see, to believe and to do and be according to its vision and knowledge, is that which determines by its power the measure of our possibilities of becoming, and it is this faith and will turned in all our inner and outer self, nature and action towards all that is highest, most divine, most real and eternal that will enable us to reach the supreme perfection.

XIX

The Gunas, Mind and Works¹

THE GITA has not yet completed its analysis of action in the light of this fundamental idea of the three gunas and the transcendence of them by a self-exceeding culmination of the highest sattwic discipline. Faith, *śraddhā*, the will to believe and to be, know, live and enact the Truth that we have seen is the principal factor, the indispensable force behind a self-developing action, most of all behind the growth of the soul by works into its full spiritual stature. But there are also the mental powers, the instruments and the conditions which help to constitute the momentum, direction and character of the activity and are therefore of importance for a full understanding of this psychological discipline. The Gita enters into a summary psychological analysis of these things before it proceeds to its great finale, the culmination of all it teaches, the highest secret which is that of a spiritual exceeding of all dharmas, a divine transcendence. And we have to follow it in its brief descriptions, summarily, expanding just enough to seize fully the main idea; for these are secondary things, but yet each of great consequence in its own place and for its own purpose. It is their action cast in the type of the gunas that we have to bring out from the brief descriptions in the text; the nature of the culmination of any or each of them beyond the gunas will automatically follow from the character of the general transcendence.

This part of the subject is introduced by a last question of Arjuna regarding the principle of Sannyasa and the principle of Tyaga and their difference. The frequent harping, the reiterated emphasis of the Gita on this crucial distinction has been amply justified by the subsequent history of the later Indian mind, its

¹ Gita, XVIII. 1-39.

constant confusion of these two very different things and its strong bent towards belittling any activity of the kind taught by the Gita as at best only a preliminary to the supreme inaction of Sannyasa. As a matter of fact, when people talk of Tyaga, of renunciation, it is always the physical renunciation of the world which they understand by the word or at least on which they lay emphasis, while the Gita takes absolutely the opposite view that the real Tyaga has action and living in the world as its basis and not a flight to the monastery, the cave or the hill-top. The real Tyaga is action with a renunciation of desire and that too is the real Sannyasa.

The liberating activity of the sattwic self-discipline must no doubt be pervaded by a spirit of renunciation,—that is an essential element: but what renunciation and in what manner of the spirit? Not the renunciation of work in the world, not any outward asceticism or any ostentation of a visible giving up of enjoyment, but a renunciation, a leaving, *tyāga*, of vital desire and ego, a total laying aside, *sannyāsa*, of the separate personal life of the desire soul and ego-governed mind and rajasic vital nature. That is the true condition for entering into the heights of Yoga whether through the impersonal self and Brahmic oneness or through universal Vasudeva or inwardly into the supreme Purushottama. More conventionally taken, Sannyasa in the standing terminology of the sages means the physical depositing or laying aside of desirable actions: Tyaga —this is the Gita's distinction—is the name given by the wise to a mental and spiritual renunciation, an entire abandonment of all attached clinging to the fruit of our works, to the action itself or to its personal initiation or rajasic impulse. In that sense Tyaga, not Sannyasa, is the better way. It is not the desirable actions that must be laid aside, but the desire which gives them that character has to be put away from us. The fruit of the action may come in the dispensation of the Master of works, but there is to be no egoistic demand for that as a reward and condition of doing works. Or the fruit may not at all come and still the work has to be performed as the thing to be done, *kartavyam karma*, the thing which the Master within demands

of us. The success, the failure are in his hands and he will regulate them according to his omniscient will and inscrutable purpose. Action, all action has indeed to be given up in the end, not physically by abstention, by immobility, by inertia, but spiritually to the Master of our being by whose power alone can any action be accomplished. There has to be a renunciation of the false idea of ourselves as the doer; for in reality it is the universal Shakti that works through our personality and our ego. The spiritual transference of all our works to the Master and his Shakti is the real Sannyasa in the teaching of the Gita.

The question still arises, what works are to be done? Those even who stand for a final physical renunciation are not at one in this difficult matter. Some would have it that all works must be excised from our life, as if that were possible. But it is not possible so long as we are in the body and alive; nor can salvation consist in reducing our active selves by trance to the lifeless immobility of the clod and the pebble. The silence of Samadhi does not abrogate the difficulty, for as soon as the breath comes again into the body, we are once more in action and have toppled down from the heights of this salvation by spiritual slumber. But the true salvation, the release by an inner renunciation of the ego and union with the Purushottama remains steady in whatever state, persists in this world or out of it or in whatever world or out of all world, is self-existent, *sarvathā vartamāno'pi*, and does not depend upon inaction or action. What then are the actions to be done? The thoroughgoing ascetic answer, not noted by the Gita — it was perhaps not altogether current at the time — might be that solely begging, eating and meditation are to be permitted among voluntary activities and otherwise only the necessary actions of the body. But the more liberal and comprehensive solution was evidently to continue the three most sattwic activities, sacrifice, giving and askesis. And these certainly are to be done, says the Gita, for they purify the wise. But more generally, and understanding these three things in their widest sense, it is the rightly regulated action, *niyatam karma*, that has to be done, action regulated by the Shastra, the

science and art of right knowledge, right works, right living, or regulated by the essential nature, *svabhāva-niyatam karma*, or, finally and best of all, regulated by the will of the Divine within and above us. The last is the true and only action of the liberated man, *muktasya karma*. To renounce these works is not a right movement—the Gita lays that down plainly and trenchantly in the end, *niyatasya tu sannyāsaḥ karmano nopaladyate*. To renounce them from an ignorant confidence in the sufficiency of that withdrawal for the true liberation is a tamasic renunciation. The gunas follow us, we see, into the renunciation of works as well as into works. A renunciation with attachment to inaction, *sāṅgo akarmani*, would be equally a tamasic withdrawal. And to give them up because they bring sorrow or are a trouble to the flesh and a weariness to the mind or in the feeling that all is vanity and vexation of spirit, is a rajasic renunciation and does not bring the high spiritual fruit; that too is not the true Tyaga. It is a result of intellectual pessimism or vital weariness, it has its roots in ego. No freedom can come from a renunciation governed by this self-regarding principle.

The sattwic principle of renunciation is to withdraw not from action, but from the personal demand, the ego factor behind it. It is to do works not dictated by desire but by the law of right living or by the essential nature, its knowledge, its ideal, its faith in itself and the Truth it sees, its *śraddhā*. Or else, on a higher spiritual plane, they are dictated by the will of the Master and done with the mind in Yoga, without any personal attachment either to the action or to the fruit of the action. There must be a complete renunciation of all desire and of all self-regarding egoistic choice and impulse and finally of that much subtler egoism of the will which either says, “The work is mine, I am the doer”, or even “The work is God’s, but I am the doer.” There must be no attachment to pleasant, desirable, lucrative or successful work and no doing of it because it has that nature; but that kind of work too has to be done,—done totally, selflessly, with the assent of the spirit,—when it is the action demanded from above and from within us, *kartavyam*

karma. There must be no aversion to unpleasant, undesirable or ungratifying action or work that brings or is likely to bring with it suffering, danger, harsh conditions, inauspicious consequences; for that too has to be accepted, totally, selflessly, with a deep understanding of its need and meaning, when it is the work that should be done, *kartavyam karma*. The wise man puts away the shrinkings and hesitations of the desire-soul and the doubts of the ordinary human intelligence, that measure by little personal, conventional or otherwise limited standards. He follows in the light of the full sattvic mind and with the power of an inner renunciation lifting the soul to impersonality, towards God, towards the universal and eternal the highest ideal law of his nature or the will of the Master of works in his secret spirit. He will not do action for the sake of any personal result or for any reward in this life or with any attachment to success, profit or consequence: neither will his works be undertaken for the sake of a fruit in the invisible hereafter or ask for a reward in other births or in worlds beyond us, the prizes for which the half-baked religious mind hungers. The three kinds of result, pleasant, unpleasant and mixed, in this or other worlds, in this or another life are for the slaves of desire and ego; these things do not cling to the free spirit. The liberated worker who has given up his works by the inner sannyasa to a greater Power is free from Karma. Action he will do, for some kind of action, less or more, small or great, is inevitable, natural, right for the embodied soul,—action is part of the divine law of living, it is the high dynamics of the spirit. The essence of renunciation, the true Tyaga, the true Sannyasa is not any rule of thumb of inaction but a disinterested soul, a selfless mind, the transition from ego to the free impersonal and spiritual nature. The spirit of this inner renunciation is the first mental condition of the highest culminating sattvic discipline.

The Gita then speaks of the five causes or indispensable requisites for the accomplishment of works as laid down by the Sankhya. These five are, first, the frame of body, life and mind which are the basis or standing-ground of the soul in Nature, *adhisthāna*, next, the doer, *kartā*, third, the various

instrumentation of Nature, *karāṇa*, fourth, the many kinds of effort which make up the force of action, *cēṣṭāḥ*, and last, Fate, *daivam*, that is to say, the influence of the Power or powers other than the human factors, other than the visible mechanism of Nature, that stand behind these and modify the work and dispose its fruits in the steps of act and consequence. These five elements make up among them all the efficient causes, *kāraṇa*, that determine the shaping and outcome of whatever work man undertakes with mind and speech and body.

The doer is ordinarily supposed to be our surface personal ego, but that is the false idea of the understanding that has not arrived at knowledge. The ego is the ostensible doer, but the ego and its will are creations and instruments of Nature with which the ignorant understanding wrongly identifies our self and they are not the only determinants even of human action, much less of its turn and consequence. When we are liberated from ego, our real self behind comes forward, impersonal and universal, and it sees in its self-vision of unity with the universal Spirit universal Nature as the doer of the work and the Divine Will behind as the master of universal Nature. Only so long as we have not this knowledge, are we bound by the character of the ego and its will as the doer and do good and evil and have the satisfaction of our tamasic, rajasic or sattvic nature. But once we live in this greater knowledge, the character and consequences of the work can make no difference to the freedom of the spirit. The work may be outwardly a terrible action like this great battle and slaughter of Kurukshetra; but although the liberated man takes his part in the struggle and though he slay all these peoples, he slays no man and he is not bound by his work, because the work is that of the Master of the Worlds and it is he who has already slain in his hidden omnipotent will all these armies. This work of destruction was needed that humanity might move forward to another creation and a new purpose, might get rid as in a fire of its past karma of unrighteousness and oppression and injustice and move towards a kingdom of the Dharma. The liberated man does all his appointed work as the living instrument one in spirit with

the universal Spirit. And knowing that all this must be and looking beyond the outward appearance he acts not for self but for God and man and the human and cosmic order,² not in fact himself acting, but conscious of the presence and power of the divine Force in his deeds and their issue. He knows that the supreme Shakti is doing in his mental, vital and physical body, *adhiṣṭhāna*, as the sole doer the thing appointed by a Fate which is in truth not Fate, not a mechanical dispensation, but the wise and all-seeing Will that is at work behind human Karma. This "terrible work" on which the whole teaching of the Gita turns, is an extreme example of action inauspicious in appearance, *akuśalam*, though a great good lies beyond the appearance. Impersonally has it to be done by the divinely appointed man for the holding together of the world purpose, *loka-saṅgrahārtham*, without personal aim or desire, because it is the appointed service.

It is clear then that the work is not the sole thing that matters; the knowledge in which we do works makes an immense spiritual difference. There are three things, says the Gita, which go to constitute the mental impulsion to works, and they are the knowledge in our will, the object of knowledge and the knower; and into the knowledge there comes always the working of the three gunas. It is this element of the gunas that makes all the difference to our view of the thing known and to the spirit in which the knower does his work. The tamasic ignorant knowledge is a small and narrow, a lazy or dully obstinate way of looking at things which has no eye for the real nature of the world or of the thing done or its field or the act or its conditions. The tamasic mind does not look for real cause and effect, but absorbs itself in one movement or one routine with an obstinate attachment to it, can see nothing but the little section of personal activity before its eyes and does not know in fact what it is doing but blindly lets natural impulsion work out through its deed results of which it has no conception, foresight or comprehending intelligence. The

² The cosmic order comes into question, because the triumph of the Asura in humanity means to that extent the triumph of the Asura in the balance of the world-forces.

rajasic knowledge is that which sees the multiplicity of things only in their separateness and variety of operation in all these existences and is unable to discover a true principle of unity or rightly coordinate its will and action, but follows the bent of ego and desire, the activity of its many-branching egoistic will and various and mixed motive in response to the solicitation of internal and environing impulsions and forces. This knowing is a jumble of sections of knowledge, often inconsistent knowledge, put forcefully together by the mind in order to make some kind of pathway through the confusion of our half-knowledge and half-ignorance. Or else it is a restless kinetic multiple action with no firm governing higher ideal and self-possessed law of true light and power within it. The sattwic knowledge on the contrary sees existence as one indivisible whole in all these divisions, one imperishable being in all becomings; it masters the principle of its action and the relation of the particular action to the total purpose of existence; it puts in the right place each step of the complete process. At the highest top of knowledge this seeing becomes the knowledge of the one spirit in the world, one in all these many existences, of the one Master of all works, of the forces of cosmos as expressions of the Godhead and of the work itself as the operation of his supreme will and wisdom in man and his life and essential nature. The personal will has come to be entirely conscious, illumined, spiritually awake, and it lives and works in the One, obeys more and more perfectly his supreme mandate and grows more and more a faultless instrument of his light and power in the human person. The supreme liberated action arrives through this culmination of the sattwic knowledge.

There are again three things, the doer, the instrument and the work done, that hold the action together and make it possible. And here again it is the difference of the gunas that determines the character of each of these elements. The sattwic mind that seeks always for a right harmony and right knowledge is the governing instrument of the sattwic man and moves all the rest of the machine. An egoistic will of desire supported by the desire-soul is the dominant instrument of the rajasic worker. An

ignorant instinct or the unenlightened impulsion of the physical mind and the crude vital nature is the chief instrumental force of the tamasic doer of action. The instrument of the liberated man is a greater spiritual light and power, far higher than the highest sattwic intelligence, and it works in him by an enveloping descent from a supraphysical centre and uses as a clear channel of its force a purified and receptive mind, life and body.

Tamasic action is that done with a confused, deluded and ignorant mind, in mechanical obedience to the instincts, impulsions and unseeing ideas, without regarding the strength or capacity or the waste and loss of blind misapplied effort or the antecedent and consequence and right conditions of the impulse, effort or labour. Rajasic action is that which a man undertakes under the dominion of desire, with his eyes fixed on the work and its hoped-for fruit and nothing else, or with an egoistic sense of his own personality in the action, and it is done with inordinate effort, with a passionate labour, with a great heaving and straining of the personal will to get at the object of its desire. Sattwic action is that which a man does calmly in the clear light of reason and knowledge and with an impersonal sense of right or duty or the demand of an ideal, as the thing that ought to be done whatever may be the result to himself in this world or another, a work performed without attachment, without liking or disliking for its spur or its drag, for the sole satisfaction of his reason and sense of right, of the lucid intelligence and the enlightened will and the pure disinterested mind and the high contented spirit. At the line of culmination of sattwa it will be transformed and become a highest impersonal action dictated by the spirit within us and no longer by the intelligence, an action moved by the highest law of the nature, free from the lower ego and its light or heavy baggage and from limitation even by best opinion, noblest desire, purest personal will or loftiest mental ideal. There will be none of these impedimenta; in their place there will stand a clear spiritual self-knowledge and illumination and an imperative intimate sense of an infallible power that acts and of the work to be done for the world and for the world's Master.

The tamasic doer of action is one who does not put himself really into the work, but acts with a mechanical mind, or obeys the most vulgar thought of the herd, follows the common routine or is wedded to a blind error and prejudice. He is obstinate in stupidity, stubborn in error and takes a foolish pride in his ignorant doing; a narrow and evasive cunning replaces true intelligence; he has a stupid and insolent contempt for those with whom he has to deal, especially for wiser men and his betters. A dull laziness, slowness, procrastination, looseness, want of vigour or of sincerity mark his action. The tamasic man is ordinarily slow to act, dilatory in his steps, easily depressed, ready soon to give up his task if it taxes his strength, his diligence or his patience. The rajasic doer of action on the contrary is one eagerly attached to the work, bent on its rapid completion, passionately desirous of fruit and reward and consequence, greedy of heart, impure of mind, often violent and cruel and brutal in the means he uses; he cares little whom he injures or how much he injures others so long as he gets what he wants, satisfies his passions and will, vindicates the claims of his ego. He is full of an incontinent joy in success and bitterly grieved and stricken by failure. The sattvic doer is free from all this attachment, this egoism, this violent strength or passionate weakness; his is a mind and will unelated by success, undepressed by failure, full of a fixed impersonal resolution, a calm rectitude of zeal or a high and pure and selfless enthusiasm in the work that has to be done. At and beyond the culmination of sattwa this resolution, zeal, enthusiasm become the spontaneous working of the spiritual Tapas and at last a highest soul-force, the direct God-Power, the mighty and steadfast movement of a divine energy in the human instrument, the self-assured steps of the Seer-will, the gnostic intelligence and with it the wide delight of the free spirit in the works of the liberated nature.

The reason armed with the intelligent will works in man in whatever manner or measure he may possess these human gifts and it is accordingly right or perverted, clouded or luminous, narrow and small or large and wide like the mind of its possessor. It is the understanding power of his nature, *buddhi*, that

chooses the work for him or, more often, approves and sets its sanction on one or other among the many suggestions of his complex instincts, impulsions, ideas and desires. It is that which determines for him what is right or wrong, to be done or not to be done, Dharma or Adharma. And the persistence of the will³ is that continuous force of mental Nature which sustains the work and gives it consistence and persistence. Here again there is the incidence of the gunas. The tamasic reason is a false, ignorant and darkened instrument which chains us to see all things in a dull and wrong light, a cloud of misconceptions, a stupid ignoring of the values of things and people. This reason calls light darkness and darkness light, takes what is not the true law and upholds it as the law, persists in the thing which ought not to be done and holds it up to us as the one right thing to be done. Its ignorance is invincible and its persistence of will is a persistence in the satisfaction and dull pride of its ignorance. That is on its side of blind action; but it is pursued also by a heavy stress of inertia and impotence, a persistence in dullness and sleep, an aversion to mental change and progress, a dwelling on the fears and pains and depressions of mind which deter us in our path or keep us to base, weak and cowardly ways. Timidity, shirking, evasion, indolence, the justification by the mind of its fears and false doubts and cautions and refusals of duty and its lapses and turnings from the call of our higher nature, a safe following of the line of least resistance so that there may be the least trouble and effort and peril in the winning of the fruit of our labour,—rather no fruit or poor result, it says, than a great and noble toil or a perilous and exacting endeavour and adventure,—these are characteristics of the tamasic will and intelligence.

The rajasic understanding, when it does not knowingly choose error and evil for the sake of the error and evil, can make distinctions between right and wrong, between what should or should not be done, but not rightly, rather with a pulling awry of their true measures and a constant distortion of values. And

³ *dhṛti*.

this is because its reason and will are a reason of the ego and a will of desire, and these powers misrepresent and distort the truth and the right to serve their own egoistic purpose. It is only when we are free from ego and desire and look steadily with a calm, pure, disinterested mind concerned only with the truth and its sequences that we can hope to see things rightly and in their just values. But the rajasic will fixes its persistent attention on the satisfaction of its own attached clingings and desires in its pursuit of interest and pleasure and of what it thinks or chooses to think right and justice, Dharma. Always it is apt to put on these things the construction which will most flatter and justify its desires and to uphold as right or legitimate the means which will best help it to get the coveted fruits of its work and endeavour. That is the cause of three fourths of the falsehood and misconduct of the human reason and will. Rajas with its vehement hold on the vital ego is the great sinner and positive misleader.

The sattwic understanding sees in its right place, right form, right measure the movement of the world, the law of action and the law of abstention from action, the thing that is to be done and the thing that is not to be done, what is safe for the soul and what is dangerous, what is to be feared and shunned and what is to be embraced by the will, what binds the spirit of man and what sets it free. These are the things that it follows or avoids by the persistence of its conscious will according to the degree of its light and the stage of evolution it has reached in its upward ascent to the highest self and Spirit. The culmination of this sattwic intelligence is found by a high persistence of the aspiring buddhi when it is settled on what is beyond the ordinary reason and mental will, pointed to the summits, turned to a steady control of the senses and the life and a union by Yoga with man's highest Self, the universal Divine, the transcendent Spirit. It is there that arriving through the sattwic guna one can pass beyond the gunas, can climb beyond the limitations of the mind and its will and intelligence and sattwa itself disappear into that which is above the gunas and beyond this instrumental nature. There the soul is enshrined in light and enthroned in firm union

with the Self and Spirit and Godhead. Arrived upon that summit we can leave the Highest to guide Nature in our members in the free spontaneity of a divine action: for there there is no wrong or confused working, no element of error or impotence to obscure or distort the luminous perfection and power of the Spirit. All these lower conditions, laws, dharmas cease to have any hold on us; the Infinite acts in the liberated man and there is no law but the immortal truth and right of the free spirit, no Karma, no kind of bondage.

Harmony and order are the characteristic qualities of the sattvic mind and temperament, quiet happiness, a clear and calm content and an inner ease and peace. Happiness is indeed the one thing which is openly or indirectly the universal pursuit of our human nature,—happiness or its suggestion or some counterfeit of it, some pleasure, some enjoyment, some satisfaction of the mind, the will, the passions or the body. Pain is an experience our nature has to accept when it must, involuntarily as a necessity, an unavoidable incident of universal Nature, or voluntarily as a means to what we seek after, but not a thing desired for its own sake,—except when it is so sought in perversity or with an ardour of enthusiasm in suffering for some touch of fierce pleasure it brings or the intense strength it engenders. But there are various kinds of happiness or pleasure according to the guna which dominates in our nature. Thus the tamasic mind can remain well-pleased in its indolence and inertia, its stupor and sleep, its blindness and its error. Nature has armed it with the privilege of a smug satisfaction in its stupidity and ignorance, its dim lights of the cave, its inert contentment, its petty or base joys and its vulgar pleasures. Delusion is the beginning of this satisfaction and delusion is its consequence; but still there is given a dull, a by no means admirable but a sufficient pleasure in his delusions to the dweller in the cave. There is a tamasic happiness founded in inertia and ignorance.

The mind of the rajasic man drinks of a more fiery and intoxicating cup; the keen, mobile, active pleasure of the senses and the body and the sense-entangled or fierily kinetic will and intelligence are to him all the joy of life and the very significance

of living. This joy is nectar to the lips at the first touch, but there is a secret poison in the bottom of the cup and after it the bitterness of disappointment, satiety, fatigue, revolt, disgust, sin, suffering, loss, transience. And it must be so because these pleasures in their external figure are not the things which the spirit in us truly demands from life; there is something behind and beyond the transience of the form, something that is lasting, satisfying, self-sufficient. What the sattvic nature seeks, therefore, is the satisfaction of the higher mind and the spirit and when it once gets this large object of its quest, there comes in a clear, pure happiness of the soul, a state of fullness, an abiding ease and peace. This happiness does not depend on outward things, but on ourselves alone and on the flowering of what is best and most inward within us. But it is not at first our normal possession; it has to be conquered by self-discipline, a labour of the soul, a high and arduous endeavour. At first this means much loss of habitual pleasure, much suffering and struggle, a poison born of the churning of our nature, a painful conflict of forces, much revolt and opposition to the change due to the ill-will of the members or the insistence of vital movements, but in the end the nectar of immortality rises in the place of this bitterness and as we climb to the higher spiritual nature we come to the end of sorrow, the euthanasia of grief and pain. That is the surpassing happiness which descends upon us at the point or line of culmination of the sattvic discipline.

The self-exceeding of the sattvic nature comes when we get beyond the great but still inferior sattvic pleasure, beyond the pleasures of mental knowledge and virtue and peace to the eternal calm of the self and the spiritual ecstasy of the divine oneness. That spiritual joy is no longer the sattvic happiness, *sukham*, but the absolute Ananda. Ananda is the secret delight from which all things are born, by which all is sustained in existence and to which all can rise in the spiritual culmination. Only then can it be possessed when the liberated man, free from ego and its desires, lives at last one with his highest self, one with all beings and one with God in an absolute bliss of the spirit.

XX

Swabhava and Swadharma¹

IT IS then by a liberating development of the soul out of this lower nature of the triple gunas into the supreme divine nature beyond the three gunas that we can best arrive at spiritual perfection and freedom. And this again can best be brought about by an anterior development of the predominance of the highest sattwic quality to a point at which sattwa also is overpassed, mounts beyond its own limitations and breaks up into a supreme freedom, absolute light, serene power of the conscious spirit in which there is no determination by conflicting gunas. A highest sattwic faith and aim new-shaping what we are according to the highest mental conception of our inner possibilities that we can form in the free intelligence, is changed by this transition into a vision of our own real being, a spiritual self-knowledge. A loftiest ideality or standard of dharma, a pursuit of the right law of our natural existence, is transformed into a free assured self-existent perfection in which all dependence on standards is transcended and the spontaneous law of the immortal self and spirit displaces the lower rule of the instruments and members. The sattwic mind and will change into that spiritual knowledge and dynamic power of identical existence in which the whole nature puts off its disguise and becomes a free self-expression of the godhead within it. The sattwic doer becomes the Jiva in contact with his source, united with the Purushottama; he is no longer the personal doer of the act, but a spiritual channel of the works of the transcendent and universal Spirit. His natural being transformed and illumined remains to be the instrument of a universal and impersonal action, the bow of the divine Archer. What was sattwic action becomes the free activity of the perfected nature in which there is no longer any personal

¹ Gita, XVIII. 40-48.

limitation, any tethering to this or that quality, any bondage of sin and virtue, self and others or any but a supreme spiritual self-determination. That is the culmination of works uplifted to the sole Divine Worker by a God-seeking and spiritual knowledge.

But there is still an incidental question of great importance in the old Indian system of culture and, even apart from that antique view, of considerable general importance, on which we have had some passing pronouncements already by the Gita and which now falls into its proper place. All action on the normal level is determined by the gunas; the action which is to be done, *kartavyam karma*, takes the triple form of giving, askesis and sacrifice, and any or all of these three may assume the character of any of the gunas. Therefore we have to proceed by the raising of these things to the highest sattwic height of which they are capable and go yet farther beyond to a largeness in which all works become a free self-giving, an energy of the divine Tapas, a perpetual sacrament of the spiritual existence. But this is a general law and all these considerations have been the enunciation of quite general principles and refer indiscriminately to all actions and to all men alike. All can eventually arrive by spiritual evolution to this strong discipline, this large perfection, this highest spiritual state. But while the general rule of mind and action is the same for all men, we see too that there is a constant law of variation and each individual acts not only according to the common laws of the human spirit, mind, will, life, but according to his own nature; each man fulfils different functions or follows a different bent according to the rule of his own circumstances, capacities, turn, character, powers. What place is to be assigned to this variation, this individual rule of nature in the spiritual discipline?

The Gita has laid some stress on this point and even assigned to it a great preliminary importance. At the very start it has spoken of the nature, rule and function of the Kshatriya as Arjuna's own law of action, *svadharma*;² it has proceeded to lay it down with a striking emphasis that one's own nature, rule,

² II. 31. *svadharmaṁ api cāveksya.*

function should be observed and followed,—even if defective, it is better than the well-performed rule of another's nature. Death in one's own law of nature is better for a man than victory in an alien movement. To follow the law of another's nature is dangerous to the soul,³ contradictory, as we may say, to the natural way of his evolution, a thing mechanically imposed and therefore imported, artificial and sterilising to one's growth towards the true stature of the spirit. What comes out of the being is the right and healthful thing, the authentic movement, not what is imposed on it from outside or laid on it by life's compulsions or the mind's error. This swadharma is of four general kinds formulated outwardly in the action of the four orders of the old Indian social culture, *cāturvarṇya*. That system corresponds, says the Gita, to a divine law, it "was created by me according to the divisions of the gunas and works,"—created from the beginning by the Master of existence. In other words, there are four distinct orders of the active nature, or four fundamental types of the soul in nature, *svabhāva*, and the work and proper function of each human being corresponds to his type of nature. This is now finally explained in preciser detail. The works of Brahmins, Kshatriyas, Vaishyas and Shudras, says the Gita, are divided according to the qualities (*gunas*) born of their own inner nature, spiritual temperament, essential character (*svabhāva*). Calm, self-control, askesis, purity, long-suffering, candour, knowledge, acceptance of spiritual truth are the work of the Brahmin, born of his swabhava. Heroism, high spirit, resolution, ability, not fleeing in the battle, giving, lordship (*iśvara-bhāva*, the temperament of the ruler and leader) are the natural work of the Kshatriya. Agriculture, cattle-keeping, trade inclusive of the labour of the craftsman and the artisan are the natural work of the Vaishya. All work of the character of service falls within the natural function of the Shudra. A man, it goes on to say, who devotes himself to his own natural work in life acquires spiritual perfection, not indeed by the mere act itself, but if he does it with right knowledge and the right motive, if he

³ III. 35.

can make it a worship of the Spirit of this creation and dedicate it sincerely to the Master of the universe from whom is all impulse to action. All labour, all action and function, whatever it be, can be consecrated by this dedication of works, can convert the life into a self-offering to the Godhead within and without us and is itself converted into a means of spiritual perfection. But a work not naturally one's own, even though it may be well performed, even though it may look better from the outside when judged by an external and mechanical standard or may lead to more success in life, is still inferior as a means of subjective growth precisely because it has an external motive and a mechanical impulsion. One's own natural work is better, even if it looks from some other point of view defective. One does not incur sin or stain when one acts in the true spirit of the work and in agreement with the law of one's own nature. All action in the three gunas is imperfect, all human work is subject to fault, defect or limitation; but that should not make us abandon our own proper work and natural function. Action should be rightly regulated action, *niyatam karma*, but intrinsically one's own, evolved from within, in harmony with the truth of one's being, regulated by the Swabhava, *svabhava-niyatam karma*.

What precisely is the intention of the Gita? Let us take it first in its more outward meaning and consider the tinge given to the principle it enounces by the ideas of the race and the time — the hue of the cultural environment, the ancient significance. These verses and the earlier pronouncements of the Gita on the same subject have been seized upon in current controversies on the caste question and interpreted by some as a sanction of the present system, used by others as a denial of the hereditary basis of caste. In point of fact the verses in the Gita have no bearing on the existing caste system, because that is a very different thing from the ancient social ideal of *caturvarna*, the four clear-cut orders of the Aryan community, and in no way corresponds with the description of the Gita. Agriculture, cattle-keeping and trade of every kind are said here to be the work of the Vaishya; but in the later system the majority of those concerned in trade and in cattle-keeping, artisans, small craftsmen and others are

actually classed as Shudras,— where they are not put altogether outside the pale,— and, with some exceptions, the merchant class is alone and that too not everywhere ranked as Vaishya. Agriculture, government and service are the professions of all classes from the Brahmin down to the Shudra. And if the economical divisions of function have been confounded beyond any possibility of rectification, the law of the guna or quality is still less a part of the later system. There all is rigid custom, *ācāra*, with no reference to the need of the individual nature. If again we take the religious side of the contention advanced by the advocates of the caste system, we can certainly fasten no such absurd idea on the words of the Gita as that it is a law of a man's nature that he shall follow without regard to his personal bent and capacities the profession of his parents or his immediate or distant ancestors, the son of a milkman be a milkman, the son of a doctor a doctor, the descendants of shoemakers remain shoemakers to the end of measurable time, still less that by doing so, by this unintelligent and mechanical repetition of the law of another's nature without regard to his own individual call and qualities a man automatically farthers his own perfection and arrives at spiritual freedom. The Gita's words refer to the ancient system of *caturvarna*, as it existed or was supposed to exist in its ideal purity,— there is some controversy whether it was ever anything more than an ideal or general norm more or less loosely followed in practice,— and it should be considered in that connection alone. Here too there is considerable difficulty as to the exact outward significance.

The ancient system of the four orders had a triple aspect; it took a social and economic, a cultural and a spiritual appearance. On the economic side it recognised four functions of the social man in the community, the religious and intellectual, the political, the economic and the servile functions. There are thus four kinds of work, the work of religious ministration, letters, learning and knowledge, the work of government, politics, administration and war, the work of production, wealth-making and exchange, the work of hired labour and service. An endeavour was made to found and stabilise the whole arrangement

of society on the partition of these four functions among four clearly marked classes. This system was not peculiar to India, but was with certain differences the dominating feature of a stage of social evolution in other ancient or mediaeval societies. The four functions are still inherent in the life of all normal communities, but the clear divisions no longer exist anywhere. The old system everywhere broke down and gave place to a more fluid order or, as in India, to a confused and complex social rigidity and economic immobility degenerating towards a chaos of castes. Along with this economic division there existed the association of a cultural idea which gave to each class its religious custom, its law of honour, ethical rule, suitable education and training, type of character, family ideal and discipline. The facts of life did not always correspond to the idea,—there is always a certain gulf found between the mental ideal and the vital and physical practice,—but there was a constant and strenuous endeavour to keep up as much as possible a real correspondence. The importance of this attempt and of the cultural ideal and atmosphere it created in the past training of the social man, can hardly be put too high; but at the present day it has little more than a historical, a past and evolutionary significance. Finally, wherever this system existed, it was given more or less a religious sanction (more in the East, very little in Europe) and in India a profounder spiritual use and significance. This spiritual significance is the real kernel of the teaching of the Gita.

The Gita found this system in existence and its ideal in possession of the Indian mind and it recognised and accepted both the ideal and system and its religious sanction. "The four-fold order was created by me," says Krishna, "according to the divisions of quality and active function." On the mere strength of this phrase it cannot altogether be concluded that the Gita regarded this system as an eternal and universal social order. Other ancient authorities did not so regard it; rather they distinctly state that it did not exist in the beginning and will collapse in a later age of the cycle. Still we may understand from the phrase that the fourfold function of social man was considered as normally inherent in the psychological and economic needs

of every community and therefore a dispensation of the Spirit that expresses itself in the human corporate and individual existence. The Gita's line is in fact an intellectual rendering of the well-known symbol in the Vedic Purusha-Sukta. But what then should be the natural basis and form of practice of these functions? The practical basis in ancient times came to be the hereditary principle. A man's social function and position were no doubt determined originally, as they are still in freer, less closely ordered communities by environment, occasion, birth and capacity; but as there set in a more fixed stratification, his rank came practically to be regulated by birth mainly or alone and in the later system of caste birth came to be the sole rule of status. The son of a Brahmin is always a Brahmin in status, though he may have nothing of the typical Brahmin qualities or character, no intellectual training or spiritual experience or religious worth or knowledge, no connection whatever with the right function of his class, no Brahminhood in his work and no Brahminhood in his nature.

This was an inevitable evolution, because the external signs are the only ones which are easily and conveniently determinable and birth was the most handy and manageable in an increasingly mechanised, complex and conventional social order. For a time the possible disparity between the hereditary fiction and the individual's real inborn character and capacity was made up or minimised by education and training: but eventually this effort ceased to be sustained and the hereditary convention held absolute rule. The ancient lawgivers, while recognising the hereditary practice, insisted that quality, character and capacity were the one sound and real basis and that without them the hereditary social status became an unspiritual falsehood because it had lost its true significance. The Gita too, as always, founds its thought on the inner significance. It speaks indeed in one verse of the work born with a man, *sahajam karma*; but this does not in itself imply a hereditary basis. According to the Indian theory of rebirth, which the Gita recognises, a man's inborn nature and course of life are essentially determined by his own past lives, are the self-development already effected by his past

actions and mental and spiritual evolution and cannot depend solely on the material factor of his ancestry, parentage, physical birth, which can only be of subordinate moment, one effective sign perhaps, but not the dominant principle. The word *sahaja* means that which is born with us, whatever is natural, inborn, innate; its equivalent in all other passages is *svabhāvaja*. The work or function of a man is determined by his qualities, *karma* is determined by *guna*; it is the work born of his Swabhava, *svabhāvajam karma*, and regulated by his Swabhava, *svabhāvaniyatam karma*. This emphasis on an inner quality and spirit which finds expression in work, function and action is the whole sense of the Gita's idea of Karma.

And from this emphasis on the inner truth and not on the outer form arises the spiritual significance and power which the Gita assigns to the following of the Swadharma. That is the really important bearing of the passage. Too much has been made of its connection with the outer social order, as if the object of the Gita were to support that for its own sake or to justify it by a religio-philosophical theory. In fact it lays very little stress on the external rule and a very great stress on the internal law which the Varna system attempted to put into regulated outward practice. And it is on the individual and spiritual value of this law and not on its communal and economic or other social and cultural importance that the eye of the thought is fixed in this passage. The Gita accepted the Vedic theory of sacrifice, but gave it a profound turn, an inner, subjective and universal meaning, a spiritual sense and direction which alters all its values. Here too and in the same way it accepts the theory of the four orders of men, but gives to it a profound turn, an inner, subjective and universal meaning, a spiritual sense and direction. And immediately the idea behind the theory changes its values and becomes an enduring and living truth not bound up with the transience of a particular social form and order. What the Gita is concerned with is not the validity of the Aryan social order now abolished or in a state of deliquescence,—if that were all, its principle of the Swabhava and Swadharma would have no permanent truth or value,—but the relation of

a man's outward life to his inward being, the evolution of his action from his soul and inner law of nature.

And we see in fact that the Gita itself indicates very clearly its intention when it describes the work of the Brahmin and the Kshatriya not in terms of external function, not defined as learning, priest-work and letters or government, war and politics, but entirely in terms of internal character. The language reads a little curiously to our ear. Calm, self-control, askesis, purity, long-suffering, candour, knowledge, acceptance and practice of spiritual truth would not ordinarily be described as a man's function, work or life occupation. Yet this is precisely what the Gita means and says,—that these things, their development, their expression in conduct, their power to cast into form the law of the sattwic nature are the real work of the Brahmin: learning, religious ministration and the other outer functions are only its most suitable field, a favourable means of this inner development, its appropriate self-expression, its way of fixing itself into firmness of type and externalised solidity of character. War, government, politics, leadership and rule are a similar field and means for the Kshatriya; but his real work is the development, the expression in conduct, the power to cast into form and dynamic rhythm of movement the law of the active battling royal or warrior spirit. The work of the Vaishya and Shudra is expressed in terms of external function, and this opposite turn may have some significance. For the temperament moved to production and wealth-getting or limited in the circle of labour and service, the mercantile and the servile mind, are usually turned outward, more occupied with the external values of their work than its power for character, and this disposition is not so favourable to a sattwic or spiritual action of the nature. That too is the reason why a commercial and industrial age or a society preoccupied with the idea of work and labour creates around it an atmosphere more favourable to the material than the spiritual life, more adapted to vital efficiency than to the subtler perfection of the high-reaching mind and spirit. Nevertheless, this kind of nature too and its functions have their inner significance, their spiritual value and can be made a means and power for

perfection. As has been said elsewhere, not alone the Brahmin with his ideal of spirituality, ethical purity and knowledge and the Kshatriya with his ideal of nobility, chivalry and high character, but the wealth-seeking Vaishya, the toil-imprisoned Shudra, woman with her narrow, circumscribed and subject life, the very outcaste born from a womb of sin, *pāpayonayah*, can by this road rise at once towards the highest inner greatness and spiritual freedom, towards perfection, towards the liberation and fulfilment of the divine element in the human being.

Three propositions suggest themselves even at the first view and may be taken as implicit in all that the Gita says in this passage. First, all action must be determined from within because each man has in him something his own, some characteristic principle and inborn power of his nature. That is the efficient power of his spirit, that creates the dynamic form of his soul in nature and to express and perfect it by action, to make it effective in capacity and conduct and life is his work, his true Karma: that points him to the right way of his inner and outer living and is the right starting-point for his farther development. Next, there are broadly four types of nature each with its characteristic function and ideal rule of work and character and the type indicates the man's proper field and should trace for him his just circle of function in his outer social existence. Finally, whatever work a man does, if done according to the law of his being, the truth of his nature, can be turned Godwards and made an effective means of spiritual liberation and perfection. The first and last of these propositions are suggestions of an evident truth and justice. The ordinary way of man's individual and social living seems indeed to be a contradiction of these principles; for certainly we bear a terrible weight of external necessity, rule and law and our need for self-expression, for the development of our true person, our real soul, our inmost characteristic law of nature in life is at every turn interfered with, thwarted, forced from its course, given a very poor chance and scope by environmental influences. Life, State, society, family, all surrounding powers seem to be in a league to lay their yoke on our spirit, compel us into their moulds, impose on us their mechanical interest and rough

immediate convenience. We become parts of a machine; we are not, are hardly allowed to be men in the true sense, *manuṣya*, *puruṣa*, souls, minds, free children of the spirit empowered to develop the highest characteristic perfection of our being and make it our means of service to the race. It would seem that we are not what we make ourselves, but what we are made. Yet the more we advance in knowledge, the more the truth of the Gita's rule is bound to appear. The child's education ought to be an outbringing of all that is best, most powerful, most intimate and living in his nature; the mould into which the man's action and development ought to run is that of his innate quality and power. He must acquire new things, but he will acquire them best, most vitally on the basis of his own developed type and inborn force. And so too the functions of a man ought to be determined by his natural turn, gift and capacities. The individual who develops freely in this manner will be a living soul and mind and will have a much greater power for the service of the race. And we are able now to see more clearly that this rule is true not only of the individual but of the community and the nation, the group soul, the collective man. The second proposition of the four types and their functions is more open to dispute. It may be said that it is too simple and positive, that it takes no sufficient account of the complexity of life and the plasticity of human nature, and, whatever the theory or its intrinsic merits, the outward social application must lead precisely to that tyranny of a mechanical rule which is the flat contradiction of all law of Swadharma. But it has a profounder meaning under the surface which gives it a less disputable value. And even if we reject it, the third proposition will yet stand in its general significance. Whatever a man's work and function in life, he can, if it is determined from within or if he is allowed to make it a self-expression of his nature, turn it into a means of growth and of a greater inner perfection. And whatever it be, if he performs his natural function in the right spirit, if he enlightens it by the ideal mind, if he turns its action to the uses of the Godhead within, serves with it the Spirit manifested in the universe or makes it a conscious instrumentation for the purposes of the Divine in humanity,

he can transmute it into a means towards the highest spiritual perfection and freedom.

But the Gita's teaching here has a still profounder significance if we take it not as a detached quotation self-contained in meaning, as is too often done, but as we should do, in connection with all that it has been saying throughout the work and especially in the last twelve chapters. The Gita's philosophy of life and works is that all proceeds from the Divine Existence, the transcendent and universal Spirit. All is a veiled manifestation of the Godhead, Vasudeva, *yataḥ pravṛttir bhūtānāṁ yena sarvam idam tatam*, and to unveil the Immortal within and in the world, to dwell in unity with the Soul of the universe, to rise in consciousness, knowledge, will, love, spiritual delight to oneness with the supreme Godhead, to live in the highest spiritual nature with the individual and natural being delivered from shortcoming and ignorance and made a conscious instrument for the works of the divine Shakti is the perfection of which humanity is capable and the condition of immortality and freedom. But how is this possible when in fact we are enveloped in natural ignorance, the soul shut up in the prison of ego, overcome, beset, hammered and moulded by the environment, mastered by the mechanism of Nature, cut off from our hold on the reality of our own secret spiritual force? The answer is that all this natural action, however now enveloped in a veiled and contrary working, still contains the principle of its own evolving freedom and perfection. A Godhead is seated in the heart of every man and is the Lord of this mysterious action of Nature. And though this Spirit of the universe, this One who is all, seems to be turning us on the wheel of the world as if mounted on a machine by the force of Maya, shaping us in our ignorance as the potter shapes a pot, as the weaver a fabric, by some skilful mechanical principle, yet is this spirit our own greatest self and it is according to the real idea, the truth of ourselves, that which is growing in us and finding always new and more adequate forms in birth after birth, in our animal and human and divine life, in that which we were, that which we are, that which we shall be,—it is in accordance with this inner soul-truth that, as our opened eyes

will discover, we are progressively shaped by this spirit within us in its all-wise omnipotence. This machinery of ego, this tangled complexity of the three gunas, mind, body, life, emotion, desire, struggle, thought, aspiration, endeavour, this locked interaction of pain and pleasure, sin and virtue, striving and success and failure, soul and environment, myself and others, is only the outward imperfect form taken by a higher spiritual Force in me which pursues through its vicissitudes the progressive self-expression of the divine reality and greatness I am secretly in spirit and shall overtly become in nature. This action contains in itself the principle of its own success, the principle of the Swabhava and Swadharma.

The Jiva is in self-expression a portion of the Purushottama. He represents in Nature the power of the supreme Spirit, he is in his personality that Power; he brings out in an individual existence the potentialities of the Soul of the universe. This Jiva itself is spirit and not the natural ego; the spirit and not the form of ego is our reality and inner soul principle. The true force of what we are and can be is there in that higher spiritual Power and this mechanical Maya of the three gunas is not the inmost and fundamental truth of its movements; it is only a present executive energy, an apparatus of lower convenience, a scheme of outward exercise and practice. The spiritual Nature which has become this multiple personality in the universe, *parā prakṛtir jīva-bhūtā*, is the basic stuff of our existence: all the rest is lower derivation and outer formation from a highest hidden activity of the spirit. And in Nature each of us has a principle and will of our own becoming; each soul is a force of self-consciousness that formulates an idea of the Divine in it and guides by that its action and evolution, its progressive self-finding, its constant varying self-expression, its apparently uncertain but secretly inevitable growth to fullness. That is our Swabhava, our own real nature; that is our truth of being which is finding now only a constant partial expression in our various becoming in the world. The law of action determined by this Swabhava is our right law of self-shaping, function, working, our Swadharma.

This principle obtains throughout cosmos; there is every-

where the one Power at work, one common universal Nature, but in each grade, form, energy, genus, species, individual creature she follows out a major Idea and minor ideas and principles of constant and complex variation that found both the permanent dharma of each and its temporary dharmas. These fix for it the law of its being in becoming, the curve of its birth and persistence and change, the force of its self-preservation and self-increasing, the lines of its stable and evolving self-expression and self-finding, the rules of its relations to all the rest of the expression of the Self in the universe. To follow the law of its being, Swadharma, to develop the idea in its being, Swabhava, is its ground of safety, its right walk and procedure. That does not in the end chain down the soul to any present formulation, but rather by this way of development it enriches itself most surely with new experiences assimilated to its own law and principle and can most powerfully grow and break at its hour beyond present moulds to a higher self-expression. To be unable to maintain its own law and principle, to fail to adapt itself to its environment in such a way as to adapt the environment to itself and make it useful to its own nature is to lose its self, forfeit its right of self, deviate from its way of self, is perdition, *vinaṣṭi*, is falsehood, death, anguish of decay and dissolution and necessity of painful self-recovery often after eclipse and disappearance, is the vain circuit of the wrong road retarding our real progress. This law obtains in one form or another in all Nature; it underlies all that action of law of universality and law of variation revealed to us by science. The same law obtains in the life of the human being, his many lives in many human bodies. Here it has an outward play and an inward spiritual truth, and the outward play can only put on its full and real meaning when we have found the inward spiritual truth and enlightened all our action with the values of the spirit. This great and desirable transformation can be effected with rapidity and power in proportion to our progress in self-knowledge.

And first we have to see that the Swabhava means one thing in the highest spiritual nature and takes quite another form and significance in the lower nature of the three gunas. There too it

acts, but is not in full possession of itself, is seeking as it were for its own true law in a half light or a darkness and goes on its way through many lower forms, many false forms, endless imperfections, perversions, self-losings, self-findings, seekings after norm and rule before it arrives at self-discovery and perfection. Our nature here is a mixed weft of knowledge and ignorance, of truth and falsehood, of success and failure, of right and wrong, of finding and losing, of sin and virtue. It is always the Swabhava that is looking for self-expression and self-finding through all these things, *svabhāvas tu pravartate*, a truth which should teach us universal charity and equality of vision, since we are all subject to the same perplexity and struggle. These motions belong, not to the soul, but to the nature. The Purushottama is not limited by this ignorance; he governs it from above and guides the soul through its changes. The pure immutable self is not touched by these movements; it witnesses and supports by its intangible eternity this mutable Nature in her vicissitudes. The real soul of the individual, the central being in us, is greater than these things, but accepts them in its outward evolution in Nature. And when we have got at this real soul, at the changeless universal self sustaining us and at the Purushottama, the Lord within us who presides over and guides the whole action of Nature, we have found all the spiritual meaning of the law of our life. For we become aware of the Master of existence expressing himself for ever in his infinite quality, *anantaguna*, in all beings. We become aware of a fourfold presence of the Divinity, a Soul of self-knowledge and world-knowledge, a Soul of strength and power that seeks for and finds and uses its powers, a Soul of mutuality and creation and relation and interchange between creature and creature, a Soul of works that labours in the universe and serves all in each and turns the labour of each to the service of all others. We become aware too of the individual Power of the Divine in us, that which directly uses these fourfold powers, assigns our strain of self-expression, determines our divine work and office and raises us through it all to his universality in manifoldness till we can find by it our spiritual oneness with him and with all that he is in the cosmos.

The external idea of the four orders of men in life is concerned only with the more outward working of this truth of the divine action; it is limited to one side of its operation in the functioning of the three gunas. It is true that in this birth men fall very largely into one of four types, the man of knowledge, the man of power, the productive vital man, the man of rude labour and service. These are not fundamental divisions, but stages of self-development in our manhood. The human being starts with a sufficient load of ignorance and inertia; his first state is one of rude toil enforced on his animal indolence by the needs of the body, by the impulsion of life, by necessity of Nature and, beyond a certain point of need, by some form of direct or indirect compulsion which society lays upon him, and those who are still governed by this tamas are the Shudras, the serfs of society who give it their toil and can contribute nothing or very little else in comparison with more developed men to its manifold play of life. By kinetic action man develops the rajasic guna in him and we get a second type of man who is driven by a constant instinct for useful creation, production, having, acquisition, holding and enjoying, the middle economic and vital man, the Vaishya. At a higher elevation of the rajasic or kinetic quality of our one common nature we get the active man with a more dominant will, with bolder ambitions, with the instinct to act, battle, and enforce his will, at the strongest to lead, command, rule, carry masses of men in his orbit, the fighter, leader, ruler, prince, king, Kshatriya. And where the sattvic mind predominates, we get the Brahmin, the man with a turn for knowledge, who brings thought, reflection, the seeking for truth and an intelligent or at the highest a spiritual rule into life and illumines by it his conception and mode of existence.

There is always in human nature something of all these four personalities developed or undeveloped, wide or narrow, suppressed or rising to the surface, but in most men one or the other tends to predominate and seems to take up sometimes the whole space of action in the nature. And in any society we should have all four types,—even, for an example, if we create a purely productive and commercial society such as modern

times have attempted, or for that matter a Shudra society of labour, of the proletariat such as attracts the most modern mind and is now being attempted in one part of Europe and advocated in others. There would still be the thinkers moved to find the law and truth and guiding rule of the whole matter, the captains and leaders of industry who would make all this productive activity an excuse for the satisfaction of their need of adventure and battle and leadership and dominance, the many typical purely productive and wealth-getting men, the average workers satisfied with a modicum of labour and the reward of their labour. But these are quite outward things, and if that were all, this economy of human type would have no spiritual significance. Or it would mean at most, as has been sometimes held in India, that we have to go through these stages of development in our births; for we must perforce proceed progressively through the tamasic, the rajaso-tamasic, the rajasic or rajaso-sattwic to the sattwic nature, ascend and fix ourselves in an inner Brahminhood, *brāhmaṇya*, and then seek salvation from that basis. But in that case there would be no logical room for the Gita's assertion that even the Shudra or Chandala can by turning his life Godwards climb straight to spiritual liberty and perfection.

The fundamental truth is not this outward thing, but a force of our inner being in movement, the truth of the fourfold active power of the spiritual nature. Each Jiva possesses in his spiritual nature these four sides, is a soul of knowledge, a soul of strength and of power, a soul of mutuality and interchange, a soul of works and service, but one side or other predominates in the action and expressive spirit and tinges the dealings of the soul with its embodied nature; it leads and gives its stamp to the other powers and uses them for the principal strain of action, tendency, experience. The Swabhava then follows, not crudely and rigidly as put in the social demarcation, but subtly and flexibly the law of this strain and develops in developing it the other three powers. Thus the pursuit of the impulse of works and service rightly done develops knowledge, increases power, trains closeness or balance of mutuality and skill and order of relation.

Each front of the fourfold godhead moves through the enlargement of its own dominant principle of nature and enrichment by the other three towards a total perfection. This development undergoes the law of the three gunas. There is possible a tamasic and rajasic way of following even the dharma of the soul of knowledge, a brute tamasic and a high sattwic way of following the dharma of power, a forceful rajasic or a beautiful and noble sattwic way of following the dharma of works and service. To arrive at the sattwic way of the inner individual Swadharma and of the works to which it moves us on the ways of life is a preliminary condition of perfection. And it may be noted that the inner Swadharma is not bound to any outward social or other form of action, occupation or function. The soul of works or that element in us that is satisfied to serve, can, for example, make the life of the pursuit of knowledge, the life of struggle and power or the life of mutuality, production and interchange a means of satisfying its divine impulse to labour and to service.

And in the end to arrive at the divinest figure and most dynamic soul-power of this fourfold activity is a wide doorway to a swiftest and largest reality of the most high spiritual perfection. This we can do if we turn the action of the Swadharma into a worship of the inner Godhead, the universal Spirit, the transcendent Purushottama and, eventually, surrender the whole action into his hands, *mayi sannyasya karmāṇi*. Then as we get beyond the limitation of the three gunas, so also do we get beyond the division of the fourfold law and beyond the limitation of all distinctive dharmas, *sarvadharmaṇ parityajya*. The Spirit takes up the individual into the universal Swabhava, perfects and unifies the fourfold soul of nature in us and does its self-determined works according to the divine will and the accomplished power of the godhead in the creature.

The Gita's injunction is to worship the Divine by our own work, *sva-karmanā*; our offering must be the works determined by our own law of being and nature. For from the Divine all movement of creation and impulse to act originates and by him all this universe is extended and for the holding together of the worlds he presides over and shapes all action through the

Swabhava. To worship him with our inner and outer activities, to make our whole life a sacrifice of works to the Highest is to prepare ourselves to become one with him in all our will and substance and nature. Our work should be according to the truth within us, it should not be an accommodation with outward and artificial standards: it must be a living and sincere expression of the soul and its inborn powers. For to follow out the living inmost truth of this soul in our present nature will help us eventually to arrive at the immortal truth of the same soul in the now superconscious supreme nature. There we can live in oneness with God and our true self and all beings and, perfected, become a faultless instrument of divine action in the freedom of the immortal Dharma.

Towards the Supreme Secret¹

THE TEACHER has completed all else that he needed to say, he has worked out all the central principles and the supporting suggestions and implications of his message and elucidated the principal doubts and questions that might rise around it, and now all that rests for him to do is to put into decisive phrase and penetrating formula the one last word, the heart itself of the message, the very core of his gospel. And we find that this decisive, last and crowning word is not merely the essence of what has been already said on the matter, not merely a concentrated description of the needed self-discipline, the Sadhana, and of that greater spiritual consciousness which is to be the result of all its effort and askesis; it sweeps out, as it were, yet farther, breaks down every limit and rule, canon and formula and opens into a wide and illimitable spiritual truth with an infinite potentiality of significance. And that is a sign of the profundity, the wide reach, the greatness of spirit of the Gita's teaching. An ordinary religious teaching or philosophical doctrine is well enough satisfied to seize on certain great and vital aspects of truth and turn them into utilisable dogma and instruction, method and practice for the guidance of man in his inner life and the law and form of his action; it does not go farther, it does not open doors out of the circle of its own system, does not lead us out into some widest freedom and unimprisoned largeness. This limitation is useful and indeed for a time indispensable. Man bounded by his mind and will has need of a law and rule, a fixed system, a definite practice selective of his thought and action; he asks for the single unmistakable hewn path hedged, fixed and secure to the tread, for the limited horizons, for the enclosed resting-places. It is only the strong

¹ Gita, XVIII. 49-56.

and few who can move through freedom to freedom. And yet in the end the free soul ought to have an issue out of the forms and systems in which the mind finds its account and takes its limited pleasure. To exceed our ladder of ascent, not to stop short even on the topmost stair but move untrammelled and at large in the wideness of the spirit is a release important for our perfection; the spirit's absolute liberty is our perfect status. And this is how the Gita leads us: it lays down a firm and sure but very large way of ascent, a great Dharma, and then it takes us out beyond all that is laid down, beyond all dharmas, into infinitely open spaces, divulges to us the hope, lets us into the secret of an absolute perfection founded in an absolute spiritual liberty, and that secret, *guhyatamam*, is the substance of what it calls its supreme word, that the hidden thing, the inmost knowledge.

And first the Gita restates the body of its message. It summarises the whole outline and essence in the short space of fifteen verses, lines of a brief and concentrated expression and significance that miss nothing of the kernel of the matter, couched in phrases of the most lucid precision and clearness. And they must therefore be scanned with care, must be read deeply in the light of all that has gone before, because here it is evidently intended to extract what the Gita itself considers to be the central sense of its own teaching. The statement sets out from the original starting-point of the thought in the book, the enigma of human action, the apparently insuperable difficulty of living in the highest self and spirit while yet we continue to do the works of the world. The easiest way is to give up the problem as insoluble, life and action as an illusion or an inferior movement of existence to be abandoned as soon as we can rise out of the snare of the world into the truth of spiritual being. That is the ascetic solution, if it can be called a solution; at any rate it is a decisive and effective way out of the enigma, a way to which ancient Indian thought of the highest and most meditative kind, as soon as it commenced to turn at a sharp incline from its first large and free synthesis, had moved with an always increasing preponderance. The Gita like the Tantra and on certain sides the later religions attempts to preserve the ancient balance: it

maintains the substance and foundation of the original synthesis, but the form has been changed and renovated in the light of a developing spiritual experience. This teaching does not evade the difficult problem of reconciling the full active life of man with the inner life in the highest self and spirit; it advances what it holds to be the real solution. It does not at all deny the efficacy of the ascetic renunciation of life for its own purpose, but it sees that that cuts instead of loosening the knot of the riddle and therefore it accounts it an inferior method and holds its own for the better way. The two paths both lead us out of the lower ignorant normal nature of man to the pure spiritual consciousness and so far both must be held to be valid and even one in essence: but where one stops short and turns back, the other advances with a firm subtlety and high courage, opens a gate on unexplored vistas, completes man in God and unites and reconciles in the spirit soul and Nature.

And therefore in the first five of these verses the Gita so phrases its statement that it shall be applicable to both the way of the inner and the way of the outer renunciation and yet in such a manner that one has only to assign to some of their common expressions a deeper and more inward meaning in order to get the sense and thought of the method favoured by the Gita. The difficulty of human action is that the soul and nature of man seem fatally subjected to many kinds of bondage, the prison of the ignorance, the meshes of the ego, the chain of the passions, the hammering insistence of the life of the moment, an obscure and limited circle without an issue. The soul shut up in this circle of action has no freedom, no leisure or light of self-knowledge to make the discovery of its self and the true value of life and meaning of existence. It has indeed such hints of its being as it can get from its active personality and dynamic nature, but the standards of perfection it can erect there are much too temporal, restricted and relative to be a satisfactory key to its own riddle. How, while absorbed and continually forced outward by the engrossing call of its active nature, is it to get back to its real self and spiritual existence? The ascetic renunciation and the way of the Gita are both agreed that it must first of all renounce this

absorption, must cast from it the external solicitation of outward things and separate silent self from active nature; it must identify itself with the immobile Spirit and live in the silence. It must arrive at an inner inactivity, *naiṣkarma*. It is therefore this saving inner passivity that the Gita puts here as the first object of its Yoga, the first necessary perfection in it or Siddhi. “An understanding without attachment in all things, a soul self-conquered and empty of desire, man attains by renunciation a supreme perfection of *naiṣkarma*.”

This ideal of renunciation, of a self-conquered stillness, spiritual passivity and freedom from desire is common to all the ancient wisdom. The Gita gives us its psychological foundation with an unsurpassed completeness and clearness. It rests on the common experience of all seekers of self-knowledge that there are two different natures and as it were two selves in us. There is the lower self of the obscure mental, vital and physical nature subject to ignorance and inertia in the very stuff of its consciousness and especially in its basis of material substance, kinetic and vital indeed by the power of life but without inherent self-possession and self-knowledge in its action, attaining in the mind to some knowledge and harmony, but only with difficult effort and by a constant struggle with its own disabilities. And there is the higher nature and self of our spiritual being, self-possessed and self-luminous but in our ordinary mentality inaccessible to our experience. At times we get glimpses of this greater thing within us, but we are not consciously within it, we do not live in its light and calm and illimitable splendour. The first of these two very different things is the Gita’s nature of the three gunas. Its seeing of itself is centred in the ego idea, its principle of action is desire born of ego, and the knot of ego is attachment to the objects of the mind and sense and the life’s desire. The inevitable constant result of all these things is bondage, settled subjection to a lower control, absence of self-mastery, absence of self-knowledge. The other greater power and presence is discovered to be nature and being of the pure spirit unconditioned by ego, that which is called in Indian philosophy self and impersonal Brahman. Its principle is an infinite and an impersonal existence

one and the same in all: and, since this impersonal existence is without ego, without conditioning quality, without desire, need or stimulus, it is immobile and immutable; eternally the same, it regards and supports but does not share or initiate the action of the universe. The soul when it throws itself out into active Nature is the Gita's Kshara, its mobile or mutable Purusha; the same soul gathered back into pure silent self and essential spirit is the Gita's Akshara, immobile or immutable Purusha.

Then evidently the straight and simplest way to get out of the close bondage of the active nature and back to spiritual freedom is to cast away entirely all that belongs to the dynamics of the ignorance and to convert the soul into a pure spiritual existence. That is what is called becoming Brahman, *brahma-bhūya*. It is to put off the lower mental, vital, physical existence and to put on the pure spiritual being. This can best be done by the intelligence and will, *buddhi*, our present topmost principle. It has to turn away from the things of the lower existence and first and foremost from its effective knot of desire, from our attachment to the objects pursued by the mind and the senses. One must become an understanding unattached in all things, *asakta-buddhiḥ sarvatra*. Then all desire passes away from the soul in its silence; it is free from all longings, *vigata-sprhaḥ*. That brings with it or it makes possible the subjection of our lower and the possession of our higher self, a possession dependent on complete self-mastery, secured by a radical victory and conquest over our mobile nature, *jitātmā*. And all this amounts to an absolute inner renunciation of the desire of things, *sannyāsa*. Renunciation is the way to this perfection and the man who has thus inwardly renounced all is described by the Gita as the true Sannyasin. But because the word usually signifies as well an outward renunciation or sometimes even that alone, the Teacher uses another word, *tyāga*, to distinguish the inward from the outward withdrawal and says that Tyaga is better than Sannyasa. The ascetic way goes much farther in its recoil from the dynamic Nature. It is enamoured of renunciation for its own sake and insists on an outward giving up of life and action, a complete quietism of soul and nature. That, the Gita replies, is

not possible entirely so long as we live in the body. As far as it is possible, it may be done, but such a rigorous diminution of works is not indispensable: it is not even really or at least ordinarily advisable. The one thing needed is a complete inner quietism and that is all the Gita's sense of *naiskarmya*.

If we ask why this reservation, why this indulgence to the dynamic principle when our object is to become the pure self and the pure self is described as inactive, *akartā*, the answer is that that inactivity and divorce of self from Nature are not the whole truth of our spiritual release. Self and Nature are in the end one thing; a total and perfect spirituality makes us one with all the Divine in self and in nature. In fact this becoming Brahman, this assumption into the self of eternal silence, *brahma-bhūya*, is not all our objective, but only the necessary immense base for a still greater and more marvellous divine becoming, *madbhāva*. And to get to that greatest spiritual perfection we have indeed to be immobile in the self, silent in all our members, but also to act in the power, Shakti, Prakriti, the true and high force of the Spirit. And if we ask how a simultaneity of what seem to be two opposites is possible, the answer is that that is the very nature of a complete spiritual being; always it has this double poise of the Infinite. The impersonal self is silent; we too must be inwardly silent, impersonal, withdrawn into the spirit. The impersonal self looks on all action as done not by it but by Prakriti; it regards with a pure equality all the working of her qualities, modes and forces: the soul impersonalised in the self must similarly regard all our actions as done not by itself but by the qualities of Prakriti; it must be equal in all things, *sarvatra*. And at the same time in order that we may not stop here, in order that we may eventually go forward and find a spiritual rule and direction in our works and not only a law of inner immobility and silence, we are asked to impose on the intelligence and will the attitude of sacrifice, all our action inwardly changed and turned into an offering to the Lord of Nature, to the Being of whom she is the self-power, *svā prakṛtiḥ*, the supreme Spirit. Even we have eventually to renounce all into his hands, to abandon all personal initiation of action, *sarvārambhāḥ*, to

keep our natural selves only as an instrument of his works and his purpose. These things have been already explained fully and the Gita does not here insist, but uses simply without farther qualification the common terms, *sannyāsa* and *naiṣkarmya*.

A completest inner quietism once admitted as our necessary means towards living in the pure impersonal self, the question how practically it brings about that result is the next issue that arises. "How, having attained this perfection, one thus attains to the Brahman, hear from me, O son of Kunti,—that which is the supreme concentrated direction of the knowledge." The knowledge meant here is the Yoga of the Sankhyas,—the Yoga of pure knowledge accepted by the Gita, *jñāna-yogena sāṅkhyānām*, so far as it is one with its own Yoga which includes also the way of works of the Yogins, *karma-yogena yoginām*. But all mention of works is kept back for the moment. For by Brahman here is meant at first the silent, the impersonal, the immutable. The Brahman indeed is both for the Upanishads and the Gita all that is and lives and moves; it is not solely an impersonal Infinite or an unthinkable and incomunicable Absolute, *acintyam avyavahāryam*. All this is Brahman, says the Upanishad; all this is Vasudeva, says the Gita,—the supreme Brahman is all that moves or is stable and his hands and feet and eyes and heads and faces are on every side of us. But still there are two aspects of this All,—his immutable eternal self that supports existence and his self of active power that moves abroad in the world movement. It is only when we lose our limited ego personality in the impersonality of the self that we arrive at the calm and free oneness by which we can possess a true unity with the universal power of the Divine in his world movement. Impersonality is a denial of limitation and division, and the cult of impersonality is a natural condition of true being, an indispensable preliminary of true knowledge and therefore a first requisite of true action. It is very clear that we cannot become one self with all or one with the universal Spirit and his vast self-knowledge, his complex will and his widespread world-purpose by insisting on our limited personality of ego; for that divides us from others and it makes us bound and self-centred in our view and in our will to action.

Imprisoned in personality we can only get at a limited union by sympathy or by some relative accommodation of ourselves to the view-point and feeling and will of others. To be one with all and with the Divine and his will in the cosmos we must become at first impersonal and free from our ego and its claims and from the ego's way of seeing ourselves and the world and others. And we cannot do this if there is not something in our being other than the personality, other than the ego, an impersonal self one with all existences. To lose ego and be this impersonal self, to become this impersonal Brahman in our consciousness is therefore the first movement of this Yoga.

How then is this to be done? First, says the Gita, through a union of our purified intelligence with the pure spiritual substance in us by the yoga of the buddhi, *buddhyā viśuddhayā yuktah*. This spiritual turning of the buddhi from the outward and downward to the inward and upward look is the essence of the Yoga of knowledge. The purified understanding has to control the whole being, *ātmānam niyamya*; it must draw us away from attachment to the outward-going desires of the lower nature by a firm and a steady will, *dhṛtyā*, which in its concentration faces entirely towards the impersonality of the pure spirit. The senses must abandon their objects, the mind must cast away the liking and disliking which these objects excite in it,—for the impersonal self has no desires and repulsions; these are vital reactions of our personality to the touches of things and the corresponding response of the mind and senses to the touches is their support and their basis. An entire control has to be acquired over the mind, speech and body, over even the vital and physical reactions, hunger and cold and heat and physical pleasure and pain; the whole of our being must become indifferent, unaffected by these things, equal to all outward touches and to their inward reactions and responses. This is the most direct and powerful method, the straight and sharp way of Yoga. There has to be a complete cessation of desire and attachment, *vairāgya*; a strong resort to impersonal solitude, a constant union with the inmost self by meditation is demanded of the seeker. And yet the object of this austere discipline is not to be self-centred in some supreme

egoistic seclusion and tranquillity of the sage and thinker averse to the trouble of participation in the world-action; the object is to get rid of all ego. One must put away utterly first the rajasic kind of egoism, egoistic strength and violence, arrogance, desire, wrath, the sense and instinct of possession, the urge of the passions, the strong lusts of life. But afterwards must be discarded egoism of all kinds, even of the most sattvic type; for the aim is to make soul and mind and life free in the end from all imprisoning I-ness and my-ness, *nirmama*. The extinction of ego and its demands of all sorts is the method put before us. For the pure impersonal self which, unshaken, supports the universe has no egoism and makes no demand on thing or person; it is calm and luminously impassive and silently regards all things and persons with an equal and impartial eye of self-knowledge and world-knowledge. Then clearly it is by living inwardly in a similar or identical impersonality that the soul within, released from the siege of things, can best become capable of oneness with this immutable Brahman which regards and knows but is not affected by the forms and mutations of the universe.

This first pursuit of impersonality as enjoined by the Gita brings with it evidently a certain completest inner quietism and is identical in its inmost parts and principles of practice with the method of Sannyasa. And yet there is a point at which its tendency of withdrawal from the claims of dynamic Nature and the external world is checked and a limit imposed to prevent the inner quietism from deepening into refusal of action and a physical withdrawal. The renunciation of their objects by the senses, *viṣayāṁs tyaktvā*, is to be of the nature of Tyaga; it must be a giving up of all sensuous attachment, *rasa*, not a refusal of the intrinsic necessary activity of the senses. One must move among surrounding things and act on the objects of the sense-field with a pure, true and intense, a simple and absolute operation of the senses for their utility to the spirit in divine action, *kevalair indriyaiś caran*, and not at all for the fulfilment of desire. There is to be *vairāgya*, not in the common significance of disgust of life or distaste for the world action, but renunciation of *rāga*, as also of its opposite, *dveṣa*. There must be a withdrawal from

all mental and vital liking as from all mental and vital disliking whatsoever. And this is asked not for extinction, but in order that there may be a perfect enabling equality in which the spirit can give an unhampered and unlimited assent to the integral and comprehensive divine vision of things and to the integral divine action in Nature. A continual resort to meditation, *dhyāna-yoga-paro nityam*, is the firm means by which the soul of man can realise its self of Power and its self of silence. And yet there must be no abandonment of the active life for a life of pure meditation; action must always be done as a sacrifice to the supreme Spirit. This movement of recoil in the path of Sannyasa prepares an absorbed disappearance of the individual in the Eternal, and renunciation of action and life in the world is an indispensable step in the process. But in the Gita's path of Tyaga it is a preparation rather for the turning of our whole life and existence and of all action into an integral oneness with the serene and immeasurable being, consciousness and will of the Divine, and it preludes and makes possible a vast and total passing upward of the soul out of the lower ego to the inexpressible perfection of the supreme spiritual nature, *parā prakrti*.

This decisive departure of the Gita's thought is indicated in the next two verses, of which the first runs with a significant sequence, "When one has become the Brahman, when one neither grieves nor desires, when one is equal to all beings, then one gets the supreme love and devotion to Me." But in the narrow path of knowledge bhakti, devotion to the personal Godhead, can be only an inferior and preliminary movement; the end, the climax is the disappearance of personality in a featureless oneness with the impersonal Brahman in which there can be no place for bhakti: for there is none to be adored and none to adore; all else is lost in the silent immobile identity of the Jiva with the Atman. Here there is given to us something yet higher than the Impersonal,—here there is the supreme Self who is the supreme Ishwara, here there is the supreme Soul and its supreme nature, here there is the Purushottama who is beyond the personal and impersonal and reconciles them on his eternal heights. The ego personality still disappears in the silence of the Impersonal, but

at the same time there remains even with this silence at the back the action of a supreme Self, one greater than the Impersonal. There is no longer the lower blind and limping action of the ego and the three gunas, but instead the vast self-determining movement of an infinite spiritual Force, a free immeasurable Shakti. All Nature becomes the power of the one Divine and all action his action through the individual as channel and instrument. In place of the ego there comes forward conscious and manifest the true spiritual individual in the freedom of his real nature, in the power of his supernal status, in the majesty and splendour of his eternal kinship to the Divine, an imperishable portion of the supreme Godhead, an indestructible power of the supreme Prakriti, *mamaivāṁśah sanātanah, parā prakṛtir jīva-bhūtā*. The soul of man then feels itself to be one in a supreme spiritual impersonality with the Purushottama and in its universalised personality a manifest power of the Godhead. Its knowledge is a light of his knowledge; its will is a force of his will; its unity with all in the universe is a play of his eternal oneness. It is in this double realisation, it is in this union of two sides of an ineffable Truth of existence by either and both of which man can approach and enter into his own infinite being, that the liberated man has to live and act and feel and determine or rather have determined for him by a greatest power of his supreme self his relations with all and the inner and outer workings of his spirit. And in that unifying realisation adoration, love and devotion are not only still possible, but are a large, an inevitable and a crowning portion of the highest experience. The One who eternally becomes the Many, the Many who in their apparent division are still eternally one, the Highest who displays in us this secret and mystery of existence, not dispersed by his multiplicity, not limited by his oneness,—this is the integral knowledge, this is the reconciling experience which makes one capable of liberated action, *muktasya karma*.

This knowledge comes, says the Gita, by a highest bhakti. It is attained when the mind exceeds itself by a supramental and high spiritual seeing of things and when the heart too rises in unison beyond our more ignorant mental forms of love and

devotion to a love that is calm and deep and luminous with widest knowledge, to a supreme delight in God and an illimitable adoration, the unperturbed ecstasy, the spiritual Ananda. When the soul has lost its separative personality, when it has become the Brahman, it is then that it can live in the true Person and can attain to the supreme revealing bhakti for the Purushottama and can come to know him utterly by the power of its profound bhakti, its heart's knowledge, *bhaktyā mām abhijānāti*. That is the integral knowledge, when the heart's fathomless vision completes the mind's absolute experience,—*samagram mām jñātvā*. “He comes to know Me,” says the Gita, “who and how much I am and in all the reality and principles of my being, *yāvān yaś cāsmi tattvataḥ*.” This integral knowledge is the knowledge of the Divine present in the individual; it is the entire experience of the Lord secret in the heart of man, revealed now as the supreme Self of his existence, the Sun of all his illumined consciousness, the Master and Power of all his works, the divine Fountain of all his soul's love and delight, the Lover and Beloved of his worship and adoration. It is the knowledge too of the Divine extended in the universe, of the Eternal from whom all proceeds and in whom all lives and has its being, of the Self and Spirit of the cosmos, of Vasudeva who has become all this that is, of the Lord of cosmic existence who reigns over the works of Nature. It is the knowledge of the divine Purusha luminous in his transcendent eternity, the form of whose being escapes from the thought of the mind but not from its silence; it is the entire living experience of him as absolute Self, supreme Brahman, supreme Soul, supreme Godhead: for that seemingly incomunicable Absolute is at the same time and even in that highest status the originating Spirit of the cosmic action and Lord of all these existences. The soul of the liberated man thus enters by a reconciling knowledge, penetrates by a perfect simultaneous delight of the transcendent Divine, of the Divine in the individual and of the Divine in the universe into the Purushottama, *mām viśate tadanantaram*. He becomes one with him in his self-knowledge and self-experience, one with him in his being and consciousness and will and world-knowledge and world-impulse, one with him in the universe and

in his unity with all creatures in the universe and one with him beyond world and individual in the transcendence of the eternal Infinite, *śāśvataṁ padam avyayam*. This is the culmination of the supreme bhakti that is at the core of the supreme knowledge.

And it then becomes evident how action continual and unceasing and of all kinds without diminution or abandonment of any part of the activities of life can be not only quite consistent with a supreme spiritual experience, but as forceful a means of reaching this highest spiritual condition as bhakti or knowledge. Nothing can be more positive than the Gita's statement in this matter. "And by doing also all actions always lodged in Me he attains by my grace the eternal and imperishable status." This liberating action is of the character of works done in a profound union of the will and all the dynamic parts of our nature with the Divine in ourself and the cosmos. It is done first as a sacrifice with the idea still of our self as the doer. It is done next without that idea and with a perception of the Prakriti as the sole doer. It is done last with the knowledge of that Prakriti as the supreme power of the Divine and a renunciation, a surrender of all our actions to him with the individual as a channel only and an instrument. Our works then proceed straight from the Self and Divine within us, are a part of the indivisible universal action, are initiated and performed not by us but by a vast transcendent Shakti. All that we do is done for the sake of the Lord seated in the heart of all, for the Godhead in the individual and for the fulfilment of his will in us, for the sake of the Divine in the world, for the good of all beings, for the fulfilment of the world action and the world purpose, or in one word for the sake of the Purushottama and done really by him through his universal Shakti. These divine works, whatever their form or outward character, cannot bind, but are rather a potent means for rising out of this lower Prakriti of the three gunas to the perfection of the supreme, divine and spiritual nature. Disengaged from these mixed and limited dharmas we escape into the immortal Dharma which comes upon us when we make ourselves one in all our consciousness and action with the Purushottama. That oneness here brings with it the power to rise there into the immortality

beyond Time. There we shall exist in his eternal transcendence.

Thus these eight verses carefully read in the light of the knowledge already given by the Teacher are a brief, but still a comprehensive indication of the whole essential idea, the entire central method, all the kernel of the complete Yoga of the Gita.

The Supreme Secret¹

THE ESSENCE of the teaching and the Yoga has thus been given to the disciple on the field of his work and battle and the divine Teacher now proceeds to apply it to his action, but in a way that makes it applicable to all action. Attached to a crucial example, spoken to the protagonist of Kurukshetra, the words bear a much wider significance and are a universal rule for all who are ready to ascend above the ordinary mentality and to live and act in the highest spiritual consciousness. To break out of ego and personal mind and see everything in the wideness of the self and spirit, to know God and adore him in his integral truth and in all his aspects, to surrender all oneself to the transcendent Soul of nature and existence, to possess and be possessed by the divine consciousness, to be one with the One in universality of love and delight and will and knowledge, one in him with all beings, to do works as an adoration and a sacrifice on the divine foundation of a world in which all is God and in the divine status of a liberated spirit, is the sense of the Gita's Yoga. It is a transition from the apparent to the supreme spiritual and real truth of our being, and one enters into it by putting off the many limitations of the separative consciousness and the mind's attachment to the passion and unrest and ignorance, the lesser light and knowledge, the sin and virtue, the dual law and standard of the lower nature. Therefore, says the Teacher, "devoting all thyself to me, giving up in thy conscious mind all thy actions into Me, resorting to Yoga of the will and intelligence be always one in heart and consciousness with Me. If thou art that at all times, then by my grace thou shalt pass safe through all difficult and perilous passages; but if from egoism thou hear not, thou shalt fall into perdition. Vain is this thy resolve, that

¹ Gita, XVIII. 57-66, 73.

in thy egoism thou thinkest, saying 'I will not fight'; thy nature shall appoint thee to thy work. What from delusion thou desirest not to do, that helplessly thou shalt do bound by thy own work born of thy swabhava. The Lord is stationed in the heart of all existences, O Arjuna, and turns them all round and round mounted on a machine by his Maya. In him take refuge in every way of thy being and by his grace thou shalt come to the supreme peace and the eternal status."

These are lines that carry in them the innermost heart of this Yoga and lead to its crowning experience and we must understand them in their innermost spirit and the whole vastness of that high summit of experience. The words express the most complete, intimate and living relation possible between God and man; they are instinct with the concentrated force of religious feeling that springs from the human being's absolute adoration, his upward surrender of his whole existence, his unreserved and perfect self-giving to the transcendent and universal Divinity from whom he comes and in whom he lives. This stress of feeling is in entire consonance with the high and enduring place that the Gita assigns to bhakti, to the love of God, to the adoration of the Highest, as the inmost spirit and motive of the supreme action and the crown and core of the supreme knowledge. The phrases used and the spiritual emotion with which they vibrate seem to give the most intense prominence possible and an utmost importance to the personal truth and presence of the Godhead. It is no abstract Absolute of the philosopher, no indifferent impersonal Presence or ineffable Silence intolerant of all relations to whom this complete surrender of all our works can be made and this closeness and intimacy of oneness with him in all the parts of our conscious existence imposed as the condition and law of our perfection or of whom this divine intervention and protection and deliverance are the promise. It is a Master of our works, a Friend and Lover of our soul, an intimate Spirit of our life, an indwelling and overdwelling Lord of all our personal and impersonal self and nature who alone can utter to us this near and moving message. And yet this is not the common relation established by the religions between man living in his sattvic or

other ego-mind and some personal form and aspect of the Deity, *ista-deva*, constructed by that mind or offered to it to satisfy its limited ideal, aspiration or desire. That is the ordinary sense and actual character of the normal mental being's religious devotion; but here there is something wider that passes beyond the mind and its limits and its dharmas. It is something deeper than the mind that offers and something greater than the Ishta-deva that receives the surrender.

That which surrenders here is the Jiva, the essential soul, the original central and spiritual being of man, the individual Purusha. It is the Jiva delivered from the limiting and ignorant ego-sense who knows himself not as a separate personality but as an eternal portion and power and soul-becoming of the Divine, *amśa sanātana*, the Jiva released and uplifted by the passing away of ignorance and established in the light and freedom of his own true and supreme nature which is one with that of the Eternal. It is this central spiritual being in us who thus enters into a perfect and closely real relation of delight and union with the origin and continent and governing Self and Power of our existence. And he who receives our surrender is no limited Deity but the Purushottama, the one eternal Godhead, the one supreme Soul of all that is and of all Nature, the original transcendent Spirit of existence. An immutable impersonal self-existence is his first obvious spiritual self-presentation to the experience of our liberated knowledge, the first sign of his presence, the first touch and impression of his substance. A universal and transcendent infinite Person or Purusha is the mysterious hidden secret of his very being, unthinkable in form of mind, *acintya-rūpa*, but very near and present to the powers of our consciousness, emotion, will and knowledge when they are lifted out of themselves, out of their blind and petty forms into a luminous spiritual, an immeasurable supramental Ananda and power and gnosis. It is He, ineffable Absolute but also Friend and Lord and Enlightener and Lover, who is the object of this most complete devotion and approach and this most intimate inner becoming and surrender. This union, this relation is a thing lifted beyond the forms and laws of the limiting mind, too high for all these inferior dharmas;

it is a truth of our self and spirit. And yet or rather therefore, because it is the truth of our self and spirit, the truth of its oneness with that Spirit from which all comes and by it and as its derivations and suggestions all exists and travails, it is not a negation but a fulfilment of all that mind and life point to and bear in them as their secret and unaccomplished significance. Thus it is not by a nirvana, an exclusion and negating extinction of all that we are here, but by a nirvana, an exclusion and negating extinction of ignorance and ego and a consequent ineffable fulfilment of our knowledge and will and heart's aspiration, an uplifted and limitless living of them in the Divine, in the Eternal, *nivasiṣyasi mayyeva*, a transfiguration and transference of all our consciousness to a greater inner status that there comes this supreme perfection and release in the spirit.

The crux of the spiritual problem, the character of this transition of which it is so difficult for the normal mind of man to get a true apprehension, turns altogether upon the capital distinction between the ignorant life of the ego in the lower nature and the large and luminous existence of the liberated Jiva in his own true spiritual nature. The renunciation of the first must be complete, the transition to the second absolute. This is the distinction on which the Gita dwells here with all possible emphasis. On the one side is this poor, trepidant, braggart egoistic condition of consciousness, *ahaṅkṛta bhāva*, the crippling narrowness of this little helpless separative personality according to whose view-point we ordinarily think and act, feel and respond to the touches of existence. On the other are the vast spiritual reaches of immortal fullness, bliss and knowledge into which we are admitted through union with the divine Being, of whom we are then a manifestation and expression in the eternal light and no longer a disguise in the darkness of the ego-nature. It is the completeness of this union which is indicated by the Gita's *satataṁ mac-cittah*. The life of the ego is founded on a construction of the apparent mental, vital and physical truth of existence, on a nexus of pragmatic relations between the individual soul and Nature, on an intellectual, emotional and sensational interpretation of things used by the little limited I in

us to maintain and satisfy the ideas and desires of its bounded separate personality amid the vast action of the universe. All our dharmas, all the ordinary standards by which we determine our view of things and our knowledge and our action, proceed upon this narrow and limiting basis, and to follow them even in the widest wheelings round our ego centre does not carry us out of this petty circle. It is a circle in which the soul is a contented or struggling prisoner, for ever subject to the mixed compulsions of Nature.

For Purusha veils himself in this round, veils his divine and immortal being in ignorance and is subject to the law of an insistent limiting Prakriti. That law is the compelling rule of the three gunas. It is a triple stair that stumbles upward towards the divine light but cannot reach it. At its base is the law or dharma of inertia: the tamasic man inertly obeys in a customary mechanical action the suggestions and impulses, the round of will of his material and his half-intellectualised vital and sensational nature. In the middle intervenes the kinetic law or dharma; the rajasic man, vital, dynamic, active, attempts to impose himself on his world and environment, but only increases the wounding weight and tyrant yoke of his turbulent passions, desires and egoisms, the burden of his restless self-will, the yoke of his rajasic nature. At the top presses down upon life the harmonic regulative law or dharma; the sattwic man attempts to erect and follow his limited personal standards of reasoning knowledge, enlightened utility or mechanised virtue, his religions and philosophies and ethical formulas, mental systems and constructions, fixed channels of idea and conduct which do not agree with the totality of the meaning of life and are constantly being broken in the movement of the wider universal purpose. The dharma of the sattwic man is the highest in the circle of the gunas; but that too is a limited view and a dwarfed standard. Its imperfect indications lead to a petty and relative perfection; temporarily satisfying to the enlightened personal ego, it is not founded either on the whole truth of the self or on the whole truth of Nature.

And in fact the actual life of man is not at any time one

of these things alone, neither a mechanical routine execution of the first crude law of Nature, nor the struggle of a kinetic soul of action, nor a victorious emergence of conscious light and reason and good and knowledge. There is a mixture of all these dharmas out of which our will and intelligence make a more or less arbitrary construction to be realised as best it can, but never in fact realised except by compromise with other compelling things in the universal Prakriti. The sattwic ideals of our enlightened will and reason are either themselves compromises, at best progressive compromises, subject to a constant imperfection and flux of change, or if absolute in their character, they can be followed only as a counsel of perfection ignored for the most part in practice or successful only as a partial influence. And if sometimes we imagine we have completely realised them, it is because we ignore in ourselves the subconscious or half-conscious mixture of other powers and motives that are usually as much or more than our ideals the real force in our action. That self-ignorance constitutes the whole vanity of human reason and self-righteousness; it is the dark secret lining behind the spotless white outsides of human sainthood and alone makes possible the specious egoisms of knowledge and virtue. The best human knowledge is a half knowledge and the highest human virtue a thing of mixed quality and, even when most sincerely absolute in standard, sufficiently relative in practice. As a general law of living the absolute sattwic ideals cannot prevail in conduct; indispensable as a power for the betterment and raising of personal aspiration and conduct, their insistence modifies life but cannot wholly change it, and their perfect fulfilment images itself only in a dream of the future or a world of heavenly nature free from the mixed strain of our terrestrial existence. It cannot be otherwise because neither the nature of this world nor the nature of man is or can be one single piece made of the pure stuff of sattwa.

The first door of escape we see out of this limitation of our possibilities, out of this confused mixture of dharmas is in a certain high trend towards impersonality, a movement inwards towards something large and universal and calm and free and

right and pure hidden now by the limiting mind of ego. The difficulty is that while we can feel a positive release into this impersonality in moments of the quiet and silence of our being, an impersonal activity is by no means so easy to realise. The pursuit of an impersonal truth or an impersonal will in our conduct is vitiated so long as we live at all in our normal mind by that which is natural and inevitable to that mind, the law of our personality, the subtle urge of our vital nature, the colour of ego. The pursuit of impersonal truth is turned by these influences into an unsuspected cloak for a system of intellectual preferences supported by our mind's limiting insistence; the pursuit of a disinterested impersonal action is converted into a greater authority and apparent high sanction for our personal will's interested selections and blind arbitrary persistences. On the other hand an absolute impersonality would seem to impose an equally absolute quietism, and this would mean that all action is bound to the machinery of the ego and the three gunas and to recede from life and its works the only way out of the circle. This impersonal silence however is not the last word of wisdom in the matter, because it is not the only way and crown or not all the way and the last crown of self-realisation open to our endeavour. There is a mightier fuller more positive spiritual experience in which the circle of our egoistic personality and the round of the mind's limitations vanish in the unwalled infinity of a greatest self and spirit and yet life and its works not only remain still acceptable and possible but reach up and out to their widest spiritual completeness and assume a grand ascending significance.

There have been different gradations in this movement to bridge the gulf between an absolute impersonality and the dynamic possibilities of our nature. The thought and practice of the Mahayana approached this difficult reconciliation through the experience of a deep desirelessness and a large dissolving freedom from mental and vital attachment and sanskaras and on the positive side a universal altruism, a fathomless compassion for the world and its creatures which became as it were the flood and outpouring of the high Nirvanic state on life and action.

That reconciliation was equally the sense of yet another spiritual experience, more conscious of a world significance, more profound, kindling, richly comprehensive on the side of action, a step nearer to the thought of the Gita: this experience we find or can at least read behind the utterances of the Taoist thinkers. There there seems to be an impersonal ineffable Eternal who is spirit and at the same time the one life of the universe: it supports and flows impartially in all things, *samat brahma*; it is a One that is nothing, Asat, because other than all that we perceive and yet the totality of all these existences. The fluid personality that forms like foam on this Infinite, the mobile ego with its attachments and repulsions, its likings and dislikings, its fixed mental distinctions, is an effective image that veils and deforms to us the one reality, Tao, the supreme All and Nothing. That can be touched only by losing personality and its little structural forms in the unseizable universal and eternal Presence and, this once achieved, we live in that a real life and have another greater consciousness which makes us penetrate all things, ourselves penetrable to all eternal influences. Here, as in the Gita, the highest way would seem to be a complete openness and self-surrender to the Eternal. "Your body is not your own," says the Taoist thinker, "it is the delegated image of God: your life is not your own, it is the delegated harmony of God: your individuality is not your own, it is the delegated adaptability of God." And here too a vast perfection and liberated action are the dynamic result of the soul's surrender. The works of ego personality are a separative running counter to the bias of universal nature. This false movement must be replaced by a wise and still passivity in the hands of the universal and eternal Power, a passivity that makes us adaptable to the infinite action, in harmony with its truth, plastic to the shaping breath of the Spirit. The man who has this harmony may be motionless within and absorbed in silence, but his Self will appear free from disguises, the divine Influence will be at work in him and while he abides in tranquillity and an inward inaction, *naiṣkarma*, yet he will act with an irresistible power and myriads of things and beings will move and gather under his influence. The impersonal force of the Self

takes up his works, movements no longer deformed by ego, and sovereignly acts through him for the keeping together and control of the world and its peoples, *loka-saṅgrahārtha*.

There is little difference between these experiences and the first impersonal activity inculcated by the Gita. The Gita also demands of us renunciation of desire, attachment and ego, transcendence of the lower nature and the breaking up of our personality and its little formations. The Gita also demands of us to live in the Self and Spirit, to see the Self and Spirit in all and all in the Self and Spirit and all as the Self and Spirit. It demands of us like the Taoist thinker to renounce our natural personality and its works into the Self, the Spirit, the Eternal, the Brahman, *ātmani sannyasya, brahmaṇi*. And there is this coincidence because that is always man's highest and freest possible experience of a quietistic inner largeness and silence reconciled with an outer dynamic active living, the two coexistent or fused together in the impersonal infinite reality and illimitable action of the one immortal Power and sole eternal Existence. But the Gita adds a phrase of immense import that alters everything, *ātmani atho mayi*. The demand is to see all things in the self and then in "Me" the Ishwara, to renounce all action into the Self, Spirit, Brahman and thence into the supreme Person, the Purushottama. There is here a still greater and profounder complex of spiritual experience, a larger transmutation of the significance of human life, a more mystic and heart-felt sweep of the return of the stream to the ocean, the restoration of personal works and the cosmic action to the Eternal Worker. The stress on pure impersonality has this difficulty and incompleteness for us that it reduces the inner person, the spiritual individual, that persistent miracle of our inmost being, to a temporary, illusive and mutable formation in the Infinite. The Infinite alone exists and except in a passing play has no true regard on the soul of the living creature. There can be no real and permanent relation between the soul in man and the Eternal, if that soul is even as the always renewable body no more than a transient phenomenon in the Infinite.

It is true that the ego and its limited personality are even such a temporary and mutable formation of Nature and therefore it

must be broken and we must feel ourselves one with all and infinite. But the ego is not the real person; when it has been dissolved there still remains the spiritual individual, there is still the eternal Jiva. The ego limitation disappears and the soul lives in a profound unity with the One and feels its universal unity with all things. And yet it is still our own soul that enjoys this expanse and oneness. The universal action, even when it is felt as the action of one and the same energy in all, even when it is experienced as the initiation and movement of the Ishwara, still takes different forms in different souls of men, *amśah sanātanah*, and a different turn in their nature. The light of spiritual knowledge, the manifold universal Shakti, the eternal delight of being stream into us and around us, concentrate in the soul and flow out on the surrounding world from each as from a centre of living spiritual consciousness whose circumference is lost in the infinite. More, the spiritual individual remains as a little universe of divine existence at once independent and inseparable from the whole infinite universe of the divine self-manifestation of which we see a petty portion around us. A portion of the Transcendent, creative, he creates his own world around him even while he retains this cosmic consciousness in which are all others. If it be objected that this is an illusion which must disappear when he retreats into the transcendent Absolute, there is after all no very certain certainty in that matter. For it is still the soul in man that is the enjoyer of this release, as it was the living spiritual centre of the divine action and manifestation; there is something more than the mere self-breaking of an illusory shell of individuality in the Infinite. This mystery of our existence signifies that what we are is not only a temporary name and form of the One, but as we may say, a soul and spirit of the Divine Oneness. Our spiritual individuality of which the ego is only a misleading shadow and projection in the ignorance has or is a truth that persists beyond the ignorance; there is something of us that dwells for ever in the supreme nature of the Purushottama, *nivasiṣyasi mayi*. This is the profound comprehensiveness of the teaching of the Gita that while it recognises the truth of the universalised impersonality into which we enter by the extinction of ego, *brahma-nirvāṇa*,

— for indeed without it there can be no liberation or at least no absolute release,— it recognises too the persistent spiritual truth of our personality as a factor of the highest experience. Not this natural but that divine and central being in us is the eternal Jiva. It is the Ishwara, Vasudeva who is all things, that takes up our mind and life and body for the enjoyment of the lower Prakriti; it is the supreme Prakriti, the original spiritual nature of the supreme Purusha that holds together the universe and appears in it as the Jiva. This Jiva then is a portion of the Purushottama's original divine spiritual being, a living power of the living Eternal. He is not merely a temporary form of lower Nature, but an eternal portion of the Highest in his supreme Prakriti, an eternal conscious ray of the divine existence and as everlasting as that supernal Prakriti. One side of the highest perfection and status of our liberated consciousness must then be to assume the true place of the Jiva in a supreme spiritual Nature, there to dwell in the glory of the supreme Purusha and there to have the joy of the eternal spiritual oneness.

This mystery of our being implies necessarily a similar supreme mystery of the being of the Purushottama, *rahasyam uttamam*. It is not an exclusive impersonality of the Absolute that is the highest secret. This highest secret is the miracle of a supreme Person and apparent vast Impersonal that are one, an immutable transcendent Self of all things and a Spirit that manifests itself here at the very foundation of cosmos as an infinite and multiple personality acting everywhere,— a Self and Spirit revealed to our last, closest, profoundest experience as an illimitable Being who accepts us and takes us to him, not into a blank of featureless existence, but most positively, deeply, wonderfully into all Himself and in all the ways of his and our conscious existence. This highest experience and this largest way of seeing open a profound, moving and endless significance to our parts of nature, our knowledge, will, heart's love and adoration, which is lost or diminished if we put an exclusive stress on the impersonal, because that stress suppresses or minimises or does not allow of the intensest fulfilment of movements and powers that are a portion of our deepest nature, intensities and

luminosities that are attached to the closest essential fibres of our self-experience. It is not the austerity of knowledge alone that can help us; there is room and infinite room for the heart's love and aspiration illumined and uplifted by knowledge, a more mystically clear, a greater calmly passionate knowledge. It is by the perpetual unified closeness of our heart-consciousness, mind-consciousness, all consciousness, *satataṁ maccittah*, that we get the widest, the deepest, the most integral experience of our oneness with the Eternal. A nearest oneness in all the being, profoundly individual in a divine passion even in the midst of universality, even at the top of transcendence is here enjoined on the human soul as its way to reach the Highest and its way to possess the perfection and the divine consciousness to which it is called by its nature as a spirit. The intelligence and will have to turn the whole existence in all its parts to the Ishwara, to the divine Self and Master of that whole existence, *buddhi-yogam upāśritya*. The heart has to cast all other emotion into the delight of oneness with him and the love of Him in all creatures. The sense spiritualised has to see and hear and feel him everywhere. The life has to be utterly his life in the Jiva. All the actions have to proceed from his sole power and sole initiation in the will, knowledge, organs of action, senses, vital parts, body. This way is deeply impersonal because the separateness of ego is abolished for the soul universalised and restored to transcendence. And yet it is intimately personal because it soars to a transcendent passion and power of indwelling and oneness. A featureless extinction may be a rigorous demand of the mind's logic of self-annulment; it is not the last word of the supreme mystery, *rahasyam uttamam*.

The refusal of Arjuna to persevere in his divinely appointed work proceeded from the ego sense in him, *ahaṅkāra*. Behind it was a mixture and confusion and tangled error of ideas and impulsions of the sattvic, rajasic, tamasic ego, the vital nature's fear of sin and its personal consequences, the heart's recoil from individual grief and suffering, the clouded reason's covering of egoistic impulses by self-deceptive specious pleas of right and virtue, our nature's ignorant shrinking from the ways of God

because they seem other than the ways of man and impose things terrible and unpleasant on his nervous and emotional parts and his intelligence. The spiritual consequences will be infinitely worse now than before, now that a higher truth and a greater way and spirit of action have been revealed to him, if yet persisting in his egoism he perseveres in a vain and impossible refusal. For it is a vain resolution, a futile recoil, since it springs only from a temporary failure of strength, a strong but passing deviation from the principle of energy of his inmost character, and is not the true will and way of his nature. If now he casts down his arms, he will yet be compelled by that nature to resume them when he sees the battle and slaughter go on without him, his abstention a defeat of all for which he has lived, the cause for whose service he was born weakened and bewildered by the absence or inactivity of its protagonist, vanquished and afflicted by the cynical and unscrupulous strength of the champions of a self-regarding unrighteousness and injustice. And in this return there will be no spiritual virtue. It was a confusion of the ideas and feelings of the ego mind that impelled his refusal; it will be his nature working through a restoration of the characteristic ideas and feelings of the ego mind that will compel him to annul his refusal. But whatever the direction, this continued subjection to the ego will mean a worse, a more fatal spiritual refusal, a perdition, *vinasti*; for it will be a definite falling away from a greater truth of his being than that which he has followed in the ignorance of the lower nature. He has been admitted to a higher consciousness, a new self-realisation, he has been shown the possibility of a divine instead of an egoistic action; the gates have been opened before him of a divine and spiritual in place of a merely intellectual, emotional, sensuous and vital life. He is called to be no longer a great blind instrument, but a conscious soul and an enlightened power and vessel of the Godhead.

For there is this possibility within us: there is open to us even at our human highest this consummation and transcendence. The ordinary mind and life of man is a half-enlightened and mostly an ignorant development and a partial uncompleted manifestation of something concealed within him. There is a

godhead there concealed from himself, subliminal to his consciousness, immobilised behind the obscure veil of a working that is not wholly his own and the secret of which he has not yet mastered. He finds himself in the world thinking and willing and feeling and acting and he takes himself instinctively or intellectually conceives of himself or at least conducts his life as a separate self-existent being who has the freedom of his thought and will and feeling and action. He bears the burden of his sin and error and suffering and takes the responsibility and merit of his knowledge and virtue; he claims the right to satisfy his sattwic, rajasic or tamasic ego and arrogates the power to shape his own destiny and to turn the world to his own uses. It is this idea of himself through which Nature works in him, and she deals with him according to his own conception, but fulfils all the time the will of the greater Spirit within her. The error of this self-view of man is like most of his errors the distortion of a truth, a distortion that creates a whole system of erroneous and yet effective values. What is true of his spirit he attributes to his ego-personality and gives it a false application, a false form and a mass of ignorant consequences. The ignorance lies in this fundamental deficiency of his surface consciousness that he identifies himself only with the outward mechanical part of him which is a convenience of Nature and with so much only of the soul as reflects and is reflected in these workings. He misses the greater inner spirit within which gives to all his mind and life and creation and action an unfulfilled promise and a hidden significance. A universal Nature here obeys the power of the Spirit who is the master of the universe, shapes each creature and determines its action according to the law of its own nature, Swabhava, shapes man too and determines his action according to the general law of nature of his kind, the law of a mental being emmeshed and ignorant in the life and the body, shapes too each man and determines his individual action according to the law of his own distinct type and the variations of his own original swabhava. It is this universal Nature that forms and directs the mechanical workings of the body and the instinctive operations of our vital and nervous parts; and there our subjection to her

is very obvious. And she has formed and directs the action too, hardly less mechanical as things now are, of our sense-mind and will and intelligence. Only, while in the animal the mind workings are a wholly mechanical obedience to Prakriti, man has this distinction that he embodies a conscious development in which the soul more actively participates, and that gives to his outward mentality the sense, useful to him, indispensable, but very largely a misleading sense, of a certain freedom and increasing mastery of his instrumental nature. And it is especially misleading because it blinds him to the hard fact of his bondage and his false idea of freedom prevents him from finding a true liberty and lordship. For the freedom and mastery of man over his nature are hardly even real and cannot be complete until he becomes aware of the Divinity within him and is in possession of his own real self and spirit other than the ego, *ātmavān*. It is that which Nature is labouring to express in mind and life and body; it is that which imposes on her this or that law of being and working, Swabhava; it is that which shapes the outward destiny and the evolution of the soul within us. It is therefore only when he is in possession of his real self and spirit that his nature can become a conscious instrument and enlightened power of the godhead.

For then, when we enter into that inmost self of our existence, we come to know that in us and in all is the one Spirit and Godhead whom all Nature serves and manifests and we ourselves are soul of this Soul, spirit of this Spirit, our body his delegated image, our life a movement of the rhythm of his life, our mind a sheath of his consciousness, our senses his instruments, our emotions and sensations the seekings of his delight of being, our actions a means of his purpose, our freedom only a shadow, suggestion or glimpse while we are ignorant, but when we know him and ourselves a prolongation and effective channel of his immortal freedom. Our masteries are a reflection of his power at work, our best knowledge a partial light of his knowledge, the highest most potent will of our spirit a projection and delegation of the will of this Spirit in all things who is the Master and Soul of the universe. It is the Lord seated in the heart

of every creature who has been turning us in all our inner and outer action during the ignorance as if mounted on a machine on the wheel of this Maya of the lower Nature. And whether obscure in the Ignorance or luminous in the Knowledge, it is for him in us and him in the world that we have our existence. To live consciously and integrally in this knowledge and this truth is to escape from ego and break out of Maya. All other highest dharmas are only a preparation for this Dharma, and all Yoga is only a means by which we can come first to some kind of union and finally, if we have the full light, to an integral union with the Master and supreme Soul and Self of our existence. The greatest Yoga is to take refuge from all the perplexities and difficulties of our nature with this indwelling Lord of all Nature, to turn to him with our whole being, with the life and body and sense and mind and heart and understanding, with our whole dedicated knowledge and will and action, *sarva-bhāvena*, in every way of our conscious self and our instrumental nature. And when we can at all times and entirely do this, then the divine Light and Love and Power takes hold of us, fills both self and instruments and leads us safe through all the doubts and difficulties and perplexities and perils that beset our soul and our life, leads us to a supreme peace and the spiritual freedom of our immortal and eternal status, *parām sāntim, sthānari sāśvatam*.

For after giving out all the laws, the dharmas, and the deepest essence of its Yoga, after saying that beyond all the first secrets revealed to the mind of man by the transforming light of spiritual knowledge, *guhyāt*, this is a still deeper more secret truth, *guhyataram*, the Gita suddenly declares that there is yet a supreme word that it has to speak, *paramām vacah*, and a most secret truth of all, *sarva-guhyatamam*. This secret of secrets the Teacher will tell to Arjuna as his highest good because he is the chosen and beloved soul, *iṣṭa*. For evidently, as had already been declared by the Upanishad, it is only the rare soul chosen by the Spirit for the revelation of his very body, *tanum svām*, who can be admitted to this mystery, because he alone is near enough in heart and mind and life to the Godhead to respond truly to it in all his being and to make it a living practice. The last, the

closing supreme word of the Gita expressing the highest mystery is spoken in two brief, direct and simple slokas and these are left without farther comment or enlargement to sink into the mind and reveal their own fullness of meaning in the soul's experience. For it is alone this inner incessantly extending experience that can make evident the infinite deal of meaning with which are for ever pregnant these words in themselves apparently so slight and simple. And we feel, as they are being uttered, that it was this for which the soul of the disciple was being prepared all the time and the rest was only an enlightening and enabling discipline and doctrine. Thus runs this secret of secrets, the highest most direct message of the Ishwara. "Become my-minded, my lover and adorer, a sacrificer to me, bow thyself to me, to me thou shalt come, this is my pledge and promise to thee, for dear art thou to me. Abandon all dharmas and take refuge in me alone. I will deliver thee from all sin and evil, do not grieve."

The Gita throughout has been insisting on a great and well-built discipline of Yoga, a large and clearly traced philosophical system, on the Swabhava and the Swadharma, on the sattvic law of life as leading out of itself by a self-exceeding exaltation to a free spiritual dharma of immortal existence utterly wide in its spaces and high-lifted beyond the limitation of even this highest guna, on many rules and means and injunctions and conditions of perfection, and now suddenly it seems to break out of its own structure and says to the human soul, "Abandon all dharmas, give thyself to the Divine alone, to the supreme Godhead above and around and within thee: that is all that thou needest, that is the truest and greatest way, that is the real deliverance." The Master of the worlds in the form of the divine Charioteer and Teacher of Kurukshestra has revealed to man the magnificent realities of God and Self and Spirit and the nature of the complex world and the relation of man's mind and life and heart and senses to the Spirit and the victorious means by which through his own spiritual self-discipline and effort he can rise out of mortality into immortality and out of his limited mental into his infinite spiritual existence. And now speaking as the Spirit and Godhead in man and in all things he says to him,

“All this personal effort and self-discipline will not in the end be needed, all following and limitation of rule and dharma can at last be thrown away as hampering encumbrances if thou canst make a complete surrender to Me, depend alone on the Spirit and Godhead within thee and all things and trust to his sole guidance. Turn all thy mind to me and fill it with the thought of me and my presence. Turn all thy heart to me, make thy every action, whatever it be, a sacrifice and offering to me. That done, leave me to do my will with thy life and soul and action; do not be grieved or perplexed by my dealings with thy mind and heart and life and works or troubled because they do not seem to follow the laws and dharmas man imposes on himself to guide his limited will and intelligence. My ways are the ways of a perfect wisdom and power and love that knows all things and combines all its movements in view of a perfect eventual result; for it is refining and weaving together the many threads of an integral perfection. I am here with thee in thy chariot of battle revealed as the Master of Existence within and without thee and I repeat the absolute assurance, the infallible promise that I will lead thee to myself through and beyond all sorrow and evil. Whatever difficulties and perplexities arise, be sure of this that I am leading thee to a complete divine life in the universal and an immortal existence in the transcendent Spirit.”

The secret thing, *guhyam*, that all deep spiritual knowledge reveals to us, mirrored in various teachings and justified in the soul’s experience, is for the Gita the secret of the spiritual self hidden within us of which mind and external Nature are only manifestations or figures. It is the secret of the constant relations between soul and Nature, Purusha and Prakriti, the secret of an indwelling Godhead who is the lord of all existence and veiled from us in its forms and movements. These are the truths taught in many ways by Vedanta and Sankhya and Yoga and synthetised in the earlier chapters of the Gita. And amidst all their apparent distinctions they are one truth and all the different ways of Yoga are various means of spiritual self-discipline by which our unquiet mind and blinded life are stilled and turned towards this many-aspected One and the secret truth of self and God made

so real to us and intimate that we can either consciously live and dwell in it or lose our separate selves in the Eternal and no longer be compelled at all by the mental Ignorance.

The more secret thing, *guhyataram*, developed by the Gita is the profound reconciling truth of the divine Purushottama, at once self and Purusha, supreme Brahman and a sole, intimate, mysterious, ineffable Godhead. That gives to the thought a larger and more deeply understanding foundation for an ultimate knowledge and to the spiritual experience a greater and more fully comprehending and comprehensive Yoga. This deeper mystery is founded on the secret of the supreme spiritual Prakriti and of the Jiva, an eternal portion of the Divine in that eternal and this manifested Nature and of one spirit and essence with him in his immutable self-existence. This profounder knowledge escapes from the elementary distinction of spiritual experience between the Beyond and what is here. For the Transcendent beyond the worlds is at the same time Vasudeva who is all things in all worlds; he is the Lord standing in the heart of every creature and the self of all existences and the origin and supernal meaning of everything that he has put forth in his Prakriti. He is manifested in his Vibhutis and he is the Spirit in Time who compels the action of the world and the Sun of all knowledge and the Lover and Beloved of the soul and the Master of all works and sacrifice. The result of an inmost opening to this deeper, truer, more secret mystery is the Gita's Yoga of integral knowledge, integral works and integral bhakti. It is the simultaneous experience of spiritual universality and a free and perfected spiritual individuality, of an entire union with God and an entire dwelling in him as at once the frame of the soul's immortality and the support and power of our liberated action in the world and the body.

And now there comes the supreme word and most secret thing of all, *guhyatamam*, that the Spirit and Godhead is an Infinite free from all dharmas and though he conducts the world according to fixed laws and leads man through his dharmas of ignorance and knowledge, sin and virtue, right and wrong, liking and disliking and indifference, pleasure and pain, joy and

sorrow and the rejection of these opposites, through his physical and vital, intellectual, emotional, ethical and spiritual forms and rules and standards, yet the Spirit and Godhead transcends all these things, and if we too can cast away all dependence on dharmas, surrender ourselves to this free and eternal Spirit and, taking care only to keep ourselves absolutely and exclusively open to him, trust to the light and power and delight of the Divine in us and, unafraid and ungrieving, accept only his guidance, then that is the truest, the greatest release and that brings the absolute and inevitable perfection of our self and nature. This is the way offered to the chosen of the Spirit,—to those only in whom he takes the greatest delight because they are nearest to him and most capable of oneness and of being even as he, freely consenting and concordant with Nature in her highest power and movement, universal in soul consciousness, transcendent in the spirit.

For a time comes in spiritual development when we become aware that all our effort and action are only our mental and vital reactions to the silent and secret insistence of a greater Presence in and around us. It is borne in upon us that all our Yoga, our aspiration and our endeavour are imperfect or narrow forms, because disfigured or at least limited by the mind's associations, demands, prejudgetments, predilections, mistranslations or half translations of a vaster truth. Our ideas and experiences and efforts are mental images only of greatest things which would be done more perfectly, directly, freely, largely, more in harmony with the universal and eternal will by that Power itself in us if we could only put ourselves passively as instruments in the hands of a supreme and absolute strength and wisdom. That Power is not separate from us; it is our own self one with the self of all others and at the same time a transcendent Being and an immanent Person. Our existence, our action taken up into this greatest Existence would be no longer, as it seems to us now, individually our own in a mental separation. It would be the vast movement of an Infinity and an intimate ineffable Presence; it would be the constant spontaneity of formation and expression in us of this deep universal self and this transcendent Spirit. The Gita

indicates that in order that that may wholly be, the surrender must be without reservations; our Yoga, our life, our state of inner being must be determined freely by this living Infinite, not predetermined by our mind's insistence on this or that dharma or any dharma. The divine Master of the Yoga, *yogeśvarah kṛṣṇah*, will then himself take up our Yoga and raise us to our utmost possible perfection, not the perfection of any external or mental standard or limiting rule, but vast and comprehensive, to the mind incalculable. It will be a perfection developed by an all-seeing Wisdom according to the whole truth, first indeed of our human swabhava, but afterwards of a greater thing into which it will open, a spirit and power illimitable, immortal, free and all-transmuting, the light and splendour of a divine and infinite nature.

All must be given as material of that transmutation. An omniscient consciousness will take up our knowledge and our ignorance, our truth and our error, cast away their forms of insufficiency, *sarva-dharmān parityajya*, and transform all into its infinite light. An almighty Power will take up our virtue and sin, our right and wrong, our strength and our weakness, cast away their tangled figures, *sarva-dharmān parityajya*, and transform all into its transcendent purity and universal good and infallible force. An ineffable Ananda will take up our petty joy and sorrow, our struggling pleasure and pain, cast away their discordances and imperfect rhythms, *sarva-dharmān parityajya*, and transform all into its transcendent and universal unimaginable delight. All that all the Yogas can do will be done and more; but it will be done in a greater seeing way, with a greater wisdom and truth than any human teacher, saint or sage can give us. The inner spiritual state to which this supreme Yoga will take us, will be above all that is here and yet comprehensive of all things in this and other worlds, but with a spiritual transformation of all, without limitation, without bondage, *sarva-dharmān parityajya*. The infinite existence, consciousness and delight of the Godhead in its calm silence and bright boundless activity will be there, will be its essential, fundamental, universal stuff, mould and character. And in that mould of infinity the Divine made manifest

will overtly dwell, no longer concealed by his Yogamaya, and whenever and as he wills build in us whatever shapes of the Infinite, translucent forms of knowledge, thought, love, spiritual joy, power and action according to his self-fulfilling will and immortal pleasure. And there will be no binding effect on the free soul and the unaffected nature, no unescapable crystallising into this or that inferior formula. For all the action will be executed by the power of the Spirit in a divine freedom, *sarva-dharmān parityajya*. An unfallen abiding in the transcendent Spirit, *param dhāma*, will be the foundation and the assurance of this spiritual state. An intimate understanding oneness with universal being and all creatures, released from the evil and suffering of the separative mind but wisely regardful of true distinctions, will be the conditioning power. A constant delight, oneness and harmony of the eternal individual here with the Divine and all that he is will be the effect of this integral liberation. The baffling problems of our human existence of which Arjuna's difficulty stands as an acute example, are created by our separative personality in the Ignorance. This Yoga because it puts the soul of man into its right relation with God and world-existence and makes our action God's, the knowledge and will shaping and moving it his and our life the harmony of a divine self-expression, is the way to their total disappearance.

The whole Yoga is revealed, the great word of the teaching is given, and Arjuna the chosen human soul is once more turned, no longer in his egoistic mind but in this greatest self-knowledge, to the divine action. The Vibhuti is ready for the divine life in the human, his conscious spirit for the works of the liberated soul, *muktasya karma*. Destroyed is the illusion of the mind; the soul's memory of its self and its truth concealed so long by the misleading shows and forms of our life has returned to it and become its normal consciousness: all doubt and perplexity gone, it can turn to the execution of the command and do faithfully whatever work for God and the world may be appointed and apportioned to it by the Master of our being, the Spirit and Godhead self-fulfilled in Time and universe.

The Core of the Gita's Meaning

WHAT THEN is the message of the Gita and what its working value, its spiritual utility to the human mind of the present day after the long ages that have elapsed since it was written and the great subsequent transformations of thought and experience? The human mind moves always forward, alters its viewpoint and enlarges its thought substance, and the effect of these changes is to render past systems of thinking obsolete or, when they are preserved, to extend, to modify and subtly or visibly to alter their value. The vitality of an ancient doctrine consists in the extent to which it naturally lends itself to such a treatment; for that means that whatever may have been the limitations or the obsolescences of the form of its thought, the truth of substance, the truth of living vision and experience on which its system was built is still sound and retains a permanent validity and significance. The Gita is a book that has worn extraordinarily well and it is almost as fresh and still in its real substance quite as new, because always renewable in experience, as when it first appeared in or was written into the frame of the Mahabharata. It is still received in India as one of the great bodies of doctrine that most authoritatively govern religious thinking and its teaching acknowledged as of the highest value if not wholly accepted by almost all shades of religious belief and opinion. Its influence is not merely philosophic or academic but immediate and living, an influence both for thought and action, and its ideas are actually at work as a powerful shaping factor in the revival and renewal of a nation and a culture. It has even been said recently by a great voice that all we need of spiritual truth for the spiritual life is to be found in the Gita. It would be to encourage the superstition of the book to take too literally that utterance. The truth of the spirit is infinite and cannot be circumscribed in that manner. Still it

may be said that most of the main clues are there and that after all the later developments of spiritual experience and discovery we can still return to it for a large inspiration and guidance. Outside India too it is universally acknowledged as one of the world's great scriptures, although in Europe its thought is better understood than its secret of spiritual practice. What is it then that gives this vitality to the thought and the truth of the Gita?

The central interest of the Gita's philosophy and Yoga is its attempt, the idea with which it sets out, continues and closes, to reconcile and even effect a kind of unity between the inner spiritual truth in its most absolute and integral realisation and the outer actualities of man's life and action. A compromise between the two is common enough, but that can never be a final and satisfactory solution. An ethical rendering of spirituality is also common and has its value as a law of conduct; but that is a mental solution which does not amount to a complete practical reconciliation of the whole truth of spirit with the whole truth of life and it raises as many problems as it solves. One of these is indeed the starting-point of the Gita; it sets out with an ethical problem raised by a conflict in which we have on one side the dharma of the man of action, a prince and warrior and leader of men, the protagonist of a great crisis, of a struggle on the physical plane, the plane of actual life, between the powers of right and justice and the powers of wrong and injustice, the demand of the destiny of the race upon him that he shall resist and give battle and establish even though through a terrible physical struggle and a giant slaughter a new era and reign of truth and right and justice, and on the other side the ethical sense which condemns the means and the action as a sin, recoils from the price of individual suffering and social strife, unsettling and disturbance and regards abstention from violence and battle as the only way and the one right moral attitude. A spiritualised ethics insists on Ahinsa, on non-injuring and non-killing as the highest law of spiritual conduct. The battle, if it is to be fought out at all, must be fought on the spiritual plane and by some kind of non-resistance or refusal of participation or only by soul resistance, and if this does not succeed on the external plane,

if the force of injustice conquers, the individual will still have preserved his virtue and vindicated by his example the highest ideal. On the other hand a more insistent extreme of the inner spiritual direction, passing beyond this struggle between social duty and an absolutist ethical ideal, is apt to take the ascetic turn and to point away from life and all its aims and standards of action towards another and celestial or supracosmic state in which alone beyond the perplexed vanity and illusion of man's birth and life and death there can be a pure spiritual existence. The Gita rejects none of these things in their place,—for it insists on the performance of the social duty, the following of the dharma for the man who has to take his share in the common action, accepts Ahinsa as part of the highest spiritual-ethical ideal and recognises the ascetic renunciation as a way of spiritual salvation. And yet it goes boldly beyond all these conflicting positions; greatly daring, it justifies all life to the spirit as a significant manifestation of the one Divine Being and asserts the compatibility of a complete human action and a complete spiritual life lived in union with the Infinite, consonant with the highest Self, expressive of the perfect Godhead.

All the problems of human life arise from the complexity of our existence, the obscurity of its essential principle and the secrecy of the inmost power that makes out its determinations and governs its purpose and its processes. If our existence were of one piece, solely material-vital or solely mental or solely spiritual, or even if the others were entirely or mainly involved in one of these or were quite latent in our subconscious or our superconscious parts, there would be nothing to perplex us; the material and vital law would be imperative or the mental would be clear to its own pure and unobstructed principle or the spiritual self-existent and self-sufficient to spirit. The animals are aware of no problems; a mental god in a world of pure mentality would admit none or would solve them all by the purity of a mental rule or the satisfaction of a rational harmony; a pure spirit would be above them and self-content in the infinite. But the existence of man is a triple web, a thing mysteriously physical-vital, mental and spiritual at once, and he knows not what are

the true relations of these things, which the real reality of his life and his nature, whither the attraction of his destiny and where the sphere of his perfection.

Matter and life are his actual basis, the thing from which he starts and on which he stands and whose requirement and law he has to satisfy if he would exist at all on earth and in the body. The material and vital law is a rule of survival, of struggle, of desire and possession, of self-assertion and the satisfaction of the body, the life and the ego. All the intellectual reasoning in the world, all the ethical idealism and spiritual absolutism of which the higher faculties of man are capable cannot abolish the reality and claim of our vital and material base or prevent the race from following under the imperative compulsion of Nature its aims and the satisfaction of its necessities or from making its important problems a great and legitimate part of human destiny and human interest and endeavour. And the intelligence of man even, failing to find any sustenance in spiritual or ideal solutions that solve everything else but the pressing problems of our actual human life, often turns away from them to an exclusive acceptance of the vital and material existence and the reasoned or instinctive pursuit of its utmost possible efficiency, well-being and organised satisfaction. A gospel of the will to live or the will to power or of a rationalised vital and material perfection becomes the recognised dharma of the human race and all else is considered either a pretentious falsity or a quite subsidiary thing, a side issue of a minor and dependent consequence.

Matter and life however in spite of their insistence and great importance are not all that man is, nor can he wholly accept mind as nothing but a servant of the life and body admitted to certain pure enjoyments of its own as a sort of reward for its service or regard it as no more than an extension and flower of the vital urge, an ideal luxury contingent upon the satisfaction of the material life. The mind much more intimately than the body and the life is the man, and the mind as it develops insists more and more on making the body and the life an instrument — an indispensable instrument and yet a considerable obstacle, otherwise there would be no problem — for its own characteristic

satisfactions and self-realisation. The mind of man is not only a vital and physical, but an intellectual, aesthetic, ethical, psychic, emotional and dynamic intelligence, and in the sphere of each of its tendencies its highest and strongest nature is to strain towards some absolute of them which the frame of life will not allow it to capture wholly and embody and make here entirely real. The mental absolute of our aspiration remains as a partly grasped shining or fiery ideal which the mind can make inwardly very present to itself, inwardly imperative on its effort, and can even effectuate partly, but not compel all the facts of life into its image. There is thus an absolute, a high imperative of intellectual truth and reason sought for by our intellectual being; there is an absolute, an imperative of right and conduct aimed at by the ethical conscience; there is an absolute, an imperative of love, sympathy, compassion, oneness yearned after by our emotional and psychic nature; there is an absolute, an imperative of delight and beauty quivered to by the aesthetic soul; there is an absolute, an imperative of inner self-mastery and control of life laboured after by the dynamic will; all these are there together and impinge upon the absolute, the imperative of possession and pleasure and safe embodied existence insisted on by the vital and physical mind. And the human intelligence, since it is not able to realise entirely any of these things, much less all of them together, erects in each sphere many standards and dharmas, standards of truth and reason, of right and conduct, of delight and beauty, of love, sympathy and oneness, of self-mastery and control, of self-preservation and possession and vital efficiency and pleasure, and tries to impose them on life. The absolute shining ideals stand far above and beyond our capacity and rare individuals approximate to them as best they can: the mass follow or profess to follow some less magnificent norm, some established possible and relative standard. Human life as a whole undergoes the attraction and yet rejects the ideal. Life resists in the strength of some obscure infinite of its own and wears down or breaks down any established mental and moral order. And this must be either because the two are quite different and disparate though meeting and interacting principles or because mind has not the

clue to the whole reality of life. The clue must be sought in something greater, an unknown something above the mentality and morality of the human creature.

The mind itself has the vague sense of some surpassing factor of this kind and in the pursuit of its absolutes frequently strikes against it. It glimpses a state, a power, a presence that is near and within and inmost to it and yet immeasurably greater and singularly distant and above it; it has a vision of something more essential, more absolute than its own absolutes, intimate, infinite, one, and it is that which we call God, Self or Spirit. This then the mind attempts to know, enter, touch and seize wholly, to approach it or become it, to arrive at some kind of unity or lose itself in a complete identity with that mystery, *āścaryam*. The difficulty is that this spirit in its purity seems something yet farther than the mental absolutes from the actualities of life, something not translatable by mind into its own terms, much less into those of life and action. Therefore we have the intransigent absolutists of the spirit who reject the mental and condemn the material being and yearn after a pure spiritual existence happily purchased by the dissolution of all that we are in life and mind, a Nirvana. The rest of spiritual effort is for these fanatics of the Absolute a mental preparation or a compromise, a spiritualising of life and mind as much as possible. And because the difficulty most constantly insistent on man's mentality in practice is that presented by the claims of his vital being, by life and conduct and action, the direction taken by this preparatory endeavour consists mainly in a spiritualising of the ethical supported by the psychical mind — or rather it brings in the spiritual power and purity to aid these in enforcing their absolute claim and to impart a greater authority than life allows to the ethical ideal of right and truth of conduct or the psychic ideal of love and sympathy and oneness. These things are helped to some highest expression, given their broadest luminous basis by an assent of the reason and will to the underlying truth of the absolute oneness of the spirit and therefore the essential oneness of all living creatures. This kind of spirituality linked on in some way to the demands of the normal mind of man,

persuaded to the acceptance of useful social duty and current law of social conduct, popularised by cult and ceremony and image is the outward substance of the world's greater religions. These religions have their individual victories, call in some ray of a higher light, impose some shadow of a larger spiritual or semi-spiritual rule, but cannot effect a complete victory, end flatly in a compromise and in the act of compromise are defeated by life. Its problems remain and even recur in their fiercest forms — even such as this grim problem of Kurukshtetra. The idealising intellect and ethical mind hope always to eliminate them, to discover some happy device born of their own aspiration and made effective by their own imperative insistence, which will annihilate this nether untoward aspect of life; but it endures and is not eliminated. The spiritualised intelligence on the other hand offers indeed by the voice of religion the promise of some victorious millennium hereafter, but meanwhile half convinced of terrestrial impotence, persuaded that the soul is a stranger and intruder upon earth, declares that after all not here in the life of the body or in the collective life of mortal man but in some immortal Beyond lies the heaven or the Nirvana where alone is to be found the true spiritual existence.

It is here that the Gita intervenes with a restatement of the truth of the Spirit, of the Self, of God and of the world and Nature. It extends and remoulds the truth evolved by a later thought from the ancient Upanishads and ventures with assured steps on an endeavour to apply its solving power to the problem of life and action. The solution offered by the Gita does not disentangle all the problem as it offers itself to modern mankind; as stated here to a more ancient mentality, it does not meet the insistent pressure of the present mind of man for a collective advance, does not respond to its cry for a collective life that will at last embody a greater rational and ethical and if possible even a dynamic spiritual ideal. Its call is to the individual who has become capable of a complete spiritual existence; but for the rest of the race it prescribes only a gradual advance, to be wisely effected by following out faithfully with more and more of intelligence and moral purpose and with a final turn to

spirituality the law of their nature. Its message touches the other smaller solutions but, even when it accepts them partly, it is to point them beyond themselves to a higher and more integral secret into which as yet only the few individuals have shown themselves fit to enter.

The Gita's message to the mind that follows after the vital and material life is that all life is indeed a manifestation of the universal Power in the individual, a derivation from the Self, a ray from the Divine, but actually it figures the Self and the Divine veiled in a disguising Maya, and to pursue the lower life for its own sake is to persist in a stumbling path and to enthroned our nature's obscure ignorance and not at all to find the true truth and complete law of existence. A gospel of the will to live, the will to power, of the satisfaction of desire, of the glorification of mere force and strength, of the worship of the ego and its vehement acquisitive self-will and tireless self-regarding intellect is the gospel of the Asura and it can lead only to some gigantic ruin and perdition. The vital and material man must accept for his government a religious and social and ideal dharma by which, while satisfying desire and interest under right restrictions, he can train and subdue his lower personality and scrupulously attune it to a higher law both of the personal and the communal life.

The Gita's message to the mind occupied with the pursuit of intellectual, ethical and social standards, the mind that insists on salvation by the observance of established dharmas, the moral law, social duty and function or the solutions of the liberated intelligence, is that this is indeed a very necessary stage, the dharma has indeed to be observed and, rightly observed, can raise the stature of the spirit and prepare and serve the spiritual life, but still it is not the complete and last truth of existence. The soul of man has to go beyond to some more absolute dharma of man's spiritual and immortal nature. And this can only be done if we repress and get rid of the ignorant formulations of the lower mental elements and the falsehood of egoistic personality, impersonalise the action of the intelligence and will, live in the identity of the one self in all, break out of all ego-moulds into the

impersonal spirit. The mind moves under the limiting compulsion of the triple lower nature, it erects its standards in obedience to the tamasic, rajasic or at highest the sattvic qualities; but the destiny of the soul is a divine perfection and liberation and that can only be based in the freedom of our highest self, can only be found by passing through its vast impersonality and universality beyond mind into the integral light of the immeasurable Godhead and supreme Infinite who is beyond all dharmas.

The Gita's message to those, absolutist seekers of the Infinite, who carry impersonality to an exclusive extreme, entertain an intolerant passion for the extinction of life and action and would have as the one ultimate aim and ideal an endeavour to cease from all individual being in the pure silence of the ineffable Spirit, is that this is indeed one path of journey and entry into the Infinite, but the most difficult, the ideal of inaction a dangerous thing to hold up by precept or example before the world, this way, though great, yet not the best way for man and this knowledge, though true, yet not the integral knowledge. The Supreme, the all-conscious Self, the Godhead, the Infinite is not solely a spiritual existence remote and ineffable; he is here in the universe at once hidden and expressed through man and the gods and through all beings and in all that is. And it is by finding him not only in some immutable silence but in the world and its beings and in all self and in all Nature, it is by raising to an integral as well as to a highest union with him all the activities of the intelligence, the heart, the will, the life that man can solve at once his inner riddle of self and God and the outer problem of his active human existence. Made Godlike, God-becoming, he can enjoy the infinite breadth of a supreme spiritual consciousness that is reached through works no less than through love and knowledge. Immortal and free, he can continue his human action from that highest level and transmute it into a supreme and all-embracing divine activity, — that indeed is the ultimate crown and significance here of all works and living and sacrifice and the world's endeavour.

This highest message is first for those who have the strength to follow after it, the master men, the great spirits, the God-

knowers, God-doers, God-lovers who can live in God and for God and do their work joyfully for him in the world, a divine work uplifted above the restless darkness of the human mind and the false limitations of the ego. At the same time, and here we get the gleam of a larger promise which we may even extend to the hope of a collective turn towards perfection,—for if there is hope for man, why should there not be hope for mankind? —the Gita declares that all can if they will, even to the lowest and sinfullest among men, enter into the path of this Yoga. And if there is a true self-surrender and an absolute unegoistic faith in the indwelling Divinity, success is certain in this path. The decisive turn is needed; there must be an abiding belief in the Spirit, a sincere and insistent will to live in the Divine, to be in self one with him and in Nature—where too we are an eternal portion of his being—one with his greater spiritual Nature, God-possessed in all our members and Godlike.

The Gita in the development of its idea raises many issues, such as the determinism of Nature, the significance of the universal manifestation and the ultimate status of the liberated soul, questions that have been the subject of unending and inconclusive debate. It is not necessary in this series of essays of which the object is a scrutiny and positive affirmation of the substance of the Gita and a disengaging of its contribution to the abiding spiritual thought of humanity and its kernel of living practice, to enter far into these discussions or to consider where we may differ from its standpoint or conclusions, make any reserves in our assent or even, strong in later experience, go beyond its metaphysical teaching or its Yoga. It will be sufficient to close with a formulation of the living message it still brings for man the eternal seeker and discoverer to guide him through the present circuits and the possible steeper ascent of his life up to the luminous heights of his spirit.

The Message of the Gita

“**T**HE SECRET of action,” so we might summarise the message of the Gita, the word of its divine Teacher, “is one with the secret of all life and existence. Existence is not merely a machinery of Nature, a wheel of law in which the soul is entangled for a moment or for ages; it is a constant manifestation of the Spirit. Life is not for the sake of life alone, but for God, and the living soul of man is an eternal portion of the Godhead. Action is for self-finding, for self-fulfilment, for self-realisation and not only for its own external and apparent fruits of the moment or the future. There is an inner law and meaning of all things dependent on the supreme as well as the manifested nature of the self; the true truth of works lies there and can be represented only incidentally, imperfectly and disguised by ignorance in the outer appearances of the mind and its action. The supreme, the faultless largest law of action is therefore to find out the truth of your own highest and inmost existence and live in it and not to follow any outer standard and dharma. All life and action must be till then an imperfection, a difficulty, a struggle and a problem. It is only by discovering your true self and living according to its true truth, its real reality that the problem can be finally solved, the difficulty and struggle overpassed and your doings perfected in the security of the discovered self and spirit turn into a divinely authentic action. Know then your self; know your true self to be God and one with the self of all others; know your soul to be a portion of God. Live in what you know; live in the self, live in your supreme spiritual nature, be united with God and Godlike. Offer, first, all your actions as a sacrifice to the Highest and the One in you and to the Highest and the One in the world; deliver last all you are and do into his hands for the supreme and universal spirit to do through you his own will and works in the world. This is the solution that I present to you and in the end you will find that there is no other.”

Here it is necessary to state the Gita's view of the fundamental opposition on which like all Indian teaching it takes its position. This finding of the true self, this knowledge of the God-head within us and all is not an easy thing; nor is it an easy thing either to turn this knowledge, even though seen by the mind, into the stuff of our consciousness and the whole condition of our action. All action is determined by the effective state of our being, and the effective state of our being is determined by the state of our constant self-seeing will and active consciousness and by its basis of kinetic movement. It is what we see and believe with our whole active nature ourselves to be and our relations with the world to mean, it is our faith, our *śraddhā*, that makes us what we are. But the consciousness of man is of a double kind and corresponds to a double truth of existence; for there is a truth of the inner reality and a truth of the outer appearance. According as he lives in one or the other, he will be a mind dwelling in human ignorance or a soul founded in divine knowledge.

In its outer appearance the truth of existence is solely what we call Nature or Prakriti, a Force that operates as the whole law and mechanism of being, creates the world which is the object of our mind and senses and creates too the mind and senses as a means of relation between the creature and the objective world in which he lives. In this outer appearance man in his soul, his mind, his life, his body seems to be a creature of Nature differentiated from others by a separation of his body, life and mind and especially by his ego-sense — that subtle mechanism constructed for him that he may confirm and centralise his consciousness of all this strong separateness and difference. All in him, his soul of mind and its action as well as the functioning of his life and body, is very evidently determined by the law of his nature, cannot get outside of it, cannot operate otherwise. He attributes indeed a certain freedom to his personal will, the will of his ego; but that in reality amounts to nothing, since his ego is only a sense which makes him identify himself with the creation that Nature has made of him, with the varying mind and life and body she has constructed. His ego is itself a product of her workings, and as is the nature of his ego, so will be the nature of its will and

according to that he must act and he can no other.

This then is man's ordinary consciousness of himself, this his faith in his own being, that he is a creature of Nature, a separate ego establishing whatever relations with others and with the world, making whatever development of himself, satisfying whatever will, desire, idea of his mind may be permissible in her circle and consonant with her intention or law in his existence.

There is, however, something in man's consciousness which does not fall in with the rigidity of this formula; he has a faith, which grows greater as his soul develops, in another and an inner reality of existence. In this inner reality the truth of existence is no longer Nature but Soul and Spirit, Purusha rather than Prakriti. Nature herself is only a power of Spirit, Prakriti the force of the Purusha. A Spirit, a Self, a Being one in all is the master of this world which is only his partial manifestation. That Spirit is the upholder of Nature and her action and the giver of the sanction by which alone her law becomes imperative and her force and its ways operative. That Spirit within her is the Knower who illuminates her and makes her conscient in us; his is the immanent and superconscient Will that inspires and motivates her workings. The soul in man, a portion of this Divinity, shares his nature. Our nature is our soul's manifestation, operates by its sanction and embodies its secret self-knowledge and self-consciousness and its will of being in her motions and forms and changes.

The real soul and self of us is hidden from our intelligence by its ignorance of inner things, by a false identification, by an absorption in our outward mechanism of mind, life and body. But if the active soul of man can once draw back from this identification with its natural instruments, if it can see and live in the entire faith of its inner reality, then all is changed to it, life and existence take on another appearance, action a different meaning and character. Our being then becomes no longer this little egoistic creation of Nature, but the largeness of a divine, immortal and spiritual Power. Our consciousness becomes no longer that of this limited and struggling mental and vital creature, but an infinite, divine and spiritual consciousness.

And our will and action too are no longer that of this bounded personality and its ego, but a divine and spiritual will and action, the will and power of the Universal, the Supreme, the All-Self and Spirit acting freely through the human figure.

"This is the great change and transfiguration," runs the message of the Godhead in man, the Avatar, the divine Teacher, "to which I call the elect, and the elect are all who can turn their will away from the ignorance of the natural instruments to the soul's deepest experience, its knowledge of the inner self and spirit, its contact with the Godhead, its power to enter into the Divine. The elect are all who can accept this faith and this greater law. It is difficult indeed to accept for the human intellect attached always to its own cloud-forms and half lights of ignorance and to the yet obscurer habits of man's mental, nervous and physical parts; but once received it is a great and sure and saving way, because it is identical with the true truth of man's being and it is the authentic movement of his inmost and supreme nature.

"But the change is a very great one, an enormous transformation, and it cannot be done without an entire turning and conversion of your whole being and nature. There will be needed a complete consecration of your self and your nature and your life to the Highest and to nothing else but the Highest; for all must be held only for the sake of the Highest, nothing accepted except as it is in God and a form of God and for the sake of the Divine. There will be needed an admission of new truth, an entire turn and giving of your mind to a new knowledge of self and others and world and God and soul and Nature, a knowledge of oneness, a knowledge of universal Divinity, which will be at first an acceptance by the understanding but must become in the end a vision, a consciousness, a permanent state of the soul and the frame of its movements.

"There will be needed a will that shall make this new knowledge, vision, consciousness a motive of action and the sole motive. And it must be the motive not of an action grudging, limited, confined to a few necessary operations of Nature or to the few things that seem helpful to a formal perfection, apposite to a religious turn or to an individual salvation, but rather all action of

human life taken up by the equal spirit and done for the sake of God and the good of all creatures. There will be needed an uplifting of the heart in a single aspiration to the Highest, a single love of the Divine Being, a single God-adoration. And there must be a widening too of the calmed and enlightened heart to embrace God in all beings. There will be needed a change of the habitual and normal nature of man as he is now to a supreme and divine spiritual nature. There will be needed in a word a Yoga which shall be at once a Yoga of integral knowledge, a Yoga of the integral will and its works, a Yoga of integral love, adoration and devotion and a Yoga of an integral spiritual perfection of the whole being and of all its parts and states and powers and motions.

"What then is this knowledge that will have to be admitted by the understanding, supported by the soul's faith and made real and living to the mind, heart and life? It is the knowledge of the supreme Soul and Spirit in its oneness and its wholeness. It is the knowledge of One who is for ever, beyond Time and Space and name and form and world, high beyond his own personal and impersonal levels and yet from whom all this proceeds, One whom all manifests in manifold Nature and her multitude of figures. It is the knowledge of him as an impersonal eternal immutable Spirit, the calm and limitless thing we call Self, infinite, equal and always the same, unaffected and unmodified and unchanged amid all this constant changing and all this multitude of individual personalities and soul powers and Nature powers and the forms and forces and eventualities of this transitory and apparent existence. It is the knowledge of him at the same time as the Spirit and Power who seems ever mutable in Nature, the Inhabitant who shapes himself to every form and modifies himself to every grade and degree and activity of his power, the Spirit who, becoming all that is even while he is for ever infinitely more than all that is, dwells in man and animal and thing, subject and object, soul and mind and life and matter, every existence and every force and every creature.

"It is not by insisting on this or that side only of the truth that you can practise this Yoga. The Divine whom you have to seek, the Self whom you have to discover, the supreme Soul of whom

your soul is an eternal portion, is simultaneously all these things; you have to know them simultaneously in a supreme oneness, enter into all of them at once and in all states and all things see Him alone. If he were solely the Spirit mutable in Nature, there would be only an eternal and universal becoming. If you limit your faith and knowledge to that one aspect, you will never go beyond your personality and its constant changeful figures; on such a foundation you would be bound altogether in the revolutions of Nature. But you are not merely a succession of soul moments in Time. There is an impersonal self in you which supports the stream of your personality and is one with God's vast and impersonal spirit. And incalculable beyond this impersonality and personality, dominating these two constant poles of what you are here, you are eternal and transcendent in the Eternal Transcendence.

"If, again, there were only the truth of an eternal impersonal self that neither acts nor creates, then the world and your soul would be illusions without any real basis. If you limit your faith and knowledge to this one lonely aspect, the renunciation of life and action is your only resource. But God in the world and you in the world are realities; the world and you are true and actual powers and manifestations of the Supreme. Therefore accept life and action and do not reject them. One with God in your impersonal self and essence, an eternal portion of the Godhead turned to him by the love and adoration of your spiritual personality for its own Infinite, make of your natural being what it is intended to be, an instrument of works, a channel, a power of the Divine. That it always is in its truth, but now unconsciously and imperfectly, through the lower nature, doomed to a disfigurement of the Godhead by your ego. Make it consciously and perfectly and without any distortion by ego a power of the Divine in his supreme spiritual nature and a vehicle of his will and his works. In this way you will live in the integral truth of your own being and you will possess the integral God-union, the whole and flawless Yoga.

"The Supreme is the Purushottama, eternal beyond all manifestation, infinite beyond all limitation by Time or Space or Causality or any of his numberless qualities and features. But

this does not mean that in his supreme eternity he is unconnected with all that happens here, cut off from world and Nature, aloof from all these beings. He is the supreme ineffable Brahman, he is impersonal self, he is all personal existences. Spirit here and life and matter, soul and Nature and the works of Nature are aspects and movements of his infinite and eternal existence. He is the supreme transcendent Spirit and all comes into manifestation from him and are his forms and his self-powers. As the one self he is here all-pervasive and equal and impersonal in man and animal and thing and object and every force of Nature. He is the supreme Soul and all souls are tireless flames of this one Soul. All living beings are in their spiritual personality deathless portions of the one Person or Purusha. He is the eternal Master of all manifested existence, Lord of the worlds and their creatures. He is the omnipotent originator of all actions, not bound by his works, and to him go all action and effort and sacrifice. He is in all and all are in him; he has become all and yet too he is above all and not limited by his creations. He is the transcendent Divine; he descends as the Avatar; he is manifest by his power in the Vibhuti; he is the Godhead secret in every human being. All the gods whom men worship are only personalities and forms and names and mental bodies of the one Divine Existence.

"The Supreme has manifested the world from his spiritual essence and in his own infinite existence and manifested himself too variously in the world. All things are his powers and figures and to the powers and figures of him there is no end, because he himself is infinite. As a pervading and containing impersonal self-existence he informs and sustains equally and without any partiality, preference or attachment to any person or thing or happening or feature all this infinite manifestation in Time and the universe. This pure and equal Self does not act, but supports impartially all the action of things. And yet it is the Supreme, but as the cosmic Spirit and the Time Spirit, who wills and conducts and determines the action of the world through his multitudinous power-to-be, that power of the Spirit which we call Nature. He creates, sustains and destroys his creations. He is seated too in the heart of every living creature and from there as a secret

Power in the individual, no less than from his universal presence in the Cosmos, he originates by force of Nature, manifests some line of his mystery in quality of nature and in executive energy of nature, shapes each thing and being separately according to its kind and initiates and upholds all action. It is this transcendent first origination from the Supreme and this constant universal and individual manifestation of Him in things and beings which makes the complex character of the cosmos.

“There are always these three eternal states of the Divine Being. There is always and for ever this one eternal immutable self-existence which is the basis and support of existent things. There is always and for ever this Spirit mutable in Nature manifested by her as all these existences. There is always and for ever this transcendent Divine who can be both of these others at once, can be a pure and silent Spirit and at the same time the active soul and life of the cycles of the universe, because he is something other and more than these two whether taken separately or together. In us is the Jiva, a spirit of this Spirit, a conscious power of the Supreme. He is one who carries in his deepest self the whole of the immanent Divine and in Nature lives in the universal Divine,—no temporary creation but an eternal soul acting and moving in the eternal Self, in the eternal Infinite.

“This conscient soul in us can adopt either of these three states of the Spirit. Man can live here in the mutability of Nature and in that alone. Ignorant of his real self, ignorant of the Godhead within him, he knows only Nature: he sees her as a mechanical executive and creative Force and sees himself and others as her creations,—egos, separated existences in her universe. It is thus, superficially, that he now lives and, while it is so and until he exceeds this outer consciousness and knows what is within him, all his thought and science can only be a shadow of light thrown upon screens and surfaces. This ignorance is possible, is even imposed, because the Godhead within is hidden by the veil of his own power. His greater reality is lost to our view by the completeness with which he has identified himself in a partial appearance with his creations and images and absorbed

the created mind in the deceptive workings of his own Nature. And it is possible also because the real, the eternal, the spiritual Nature which is the secret of things in themselves is not manifest in their outward phenomena. The Nature which we see when we look outwards, the Nature which acts in our mind and body and senses is a lower Force, a derivation, a Magician who creates figures of the Spirit but hides the Spirit in its figures, conceals the truth and makes men look upon masks, a Force which is only capable of a sum of secondary and depressed values, not of the full power and glory and ecstasy and sweetness of the manifestation of the Divine. This Nature in us is a Maya of the ego, a tangle of the dualities, a web of ignorance and the three gunas. And so long as the soul of man lives in the surface fact of mind and life and body and not in his self and spirit, he cannot see God and himself and the world as they really are, cannot overcome this Maya, but must do what he can with its terms and figures.

"It is possible by drawing back from the lower turn of his nature in which man now lives, to awake from this light that is darkness and live in the luminous truth of the eternal and immutable self-existence. Man then is no longer bound up in his narrow prison of personality, no longer sees himself as this little I that thinks and acts and feels and struggles and labours for a little. He is merged in the vast and free impersonality of the pure spirit; he becomes the Brahman; he knows himself as one with the one self in all things. He is no longer aware of ego, no longer troubled by the dualities, no longer feels anguish of grief or disturbance of joy, is no longer shaken by desire, is no longer troubled by sin or limited by virtue. Or if the shadows of these things remain, he sees and knows them only as Nature working in her own qualities and does not feel them to be the truth of himself in which he lives. Nature alone acts and works out her mechanical figures: but the pure spirit is silent, inactive and free. Calm, untouched by her workings, it regards them with a perfect equality and knows itself to be other than these things. This spiritual state brings with it a still peace and freedom but not the dynamic divinity, not the integral perfection; it is a great step,

but it is not the integral God-knowledge and self-knowledge.

“A perfect perfection comes only by living in the supreme and the whole Divine. Then the soul of man is united with the Godhead of which it is a portion; then it is one with all beings in the self and spirit, one with them both in God and in Nature; then it is not only free but complete, plunged in the supreme felicity, ready for its ultimate perfection. He still sees the self as an eternal and changeless Spirit silently supporting all things; but he sees also Nature no longer as a mere mechanical force that works out things according to the mechanism of the gunas, but as a power of the Spirit and the force of God in manifestation. He sees that the lower Nature is not the inmost truth of the spirit’s action; he becomes aware of a highest spiritual nature of the Divine in which is contained the source and the yet to be realised greater truth of all that is imperfectly figured now in mind, life and body. Arisen from the lower mental to this supreme spiritual nature, he is delivered there from all ego. He knows himself as a spiritual being, in his essence one with all existences and in his active nature a power of the one Godhead and an eternal soul of the transcendent Infinite. He sees all in God and God in all; he sees all things as Vasudeva. He is delivered from the dualities of joy and grief, from the pleasant and the unpleasant, from desire and disappointment, from sin and virtue. All henceforth is to his conscious sight and sense the will and working of the Divine. He lives and acts as a soul and portion of the universal consciousness and power; he is filled with the transcendent divine delight, a spiritual Ananda. His action becomes the divine action and his status the highest spiritual status.

* *

“This is the solution, this the salvation, this the perfection that I offer to all those who can listen to a divine voice within them and are capable of this faith and knowledge. But to climb to this pre-eminent condition the first necessity, the original radical step is to turn away from all that belongs to your lower Nature

and fix yourself by concentration of the will and intelligence on that which is higher than either will or intelligence, higher than mind and heart and sense and body. And first of all you must turn to your own eternal and immutable self, impersonal and the same in all creatures. So long as you live in ego and mental personality, you will always spin endlessly in the same rounds and there can be no real issue. Turn your will inward beyond the heart and its desires and the sense and its attractions; lift it upward beyond the mind and its associations and attachments and its bounded wish and thought and impulse. Arrive at something within you that is eternal, ever unchanged, calm, unperturbed, equal, impartial to all things and persons and happenings, not affected by any action, not altered by the figures of Nature. Be that, be the eternal self, be the Brahman. If you can become that by a permanent spiritual experience, you will have an assured basis on which you can stand delivered from the limitations of your mind-created personality, secure against any fall from peace and knowledge, free from ego.

“Thus to impersonalise your being is not possible so long as you nurse and cherish and cling to your ego or anything that belongs to it. Desire and the passions that arise from desire are the principal sign and knot of ego. It is desire that makes you go on saying I and mine and subjects you through a persistent egoism to satisfaction and dissatisfaction, liking and disliking, hope and despair, joy and grief, to your petty loves and hatreds, to wrath and passion, to your attachment to success and things pleasant and to the sorrow and suffering of failure and of things unpleasant. Desire brings always confusion of mind and limitation of the will, an egoistic and distorted view of things, a failure and clouding of knowledge. Desire and its preferences and violences are the first strong root of sin and error. There can be while you cherish desire no assured stainless tranquillity, no settled light, no calm pure knowledge. There can be no right being — for desire is a perversion of the spirit — and no firm foundation for right thought, action and feeling. Desire, if permitted to remain under whatever colour, is a perpetual menace even to the wisest and can at any moment subtly or violently cast

down the mind from even its firmest and most surely acquired foundation. Desire is the chief enemy of spiritual perfection.

"Slay then desire; put away attachment to the possession and enjoyment of the outwardness of things. Separate yourself from all that comes to you as outward touches and solicitations, as objects of the mind and senses. Learn to bear and reject all the rush of the passions and to remain securely seated in your inner self even while they rage in your members, until at last they cease to affect any part of your nature. Bear and put away similarly the forceful attacks and even the slightest insinuating touches of joy and sorrow. Cast away liking and disliking, destroy preference and hatred, root out shrinking and repugnance. Let there be a calm indifference to these things and to all the objects of desire in all your nature. Look on them with the silent and tranquil regard of an impersonal spirit.

"The result will be an absolute equality and the power of unshakable calm that the universal spirit maintains in front of its creations, facing ever the manifold action of Nature. Look with equal eyes; receive with an equal heart and mind all that comes to you, success and failure, honour and dishonour, the esteem and love of men and their scorn and persecution and hatred, every happening that would be to others a cause of joy and every happening that would be to others a cause of sorrow. Look with equal eyes on all persons, on the good and the wicked, on the wise and the foolish, on the Brahmin and the outcaste, on man at his highest and every pettiest creature. Meet equally all men whatever their relations to you, friend and ally, neutral and indifferent, opponent and enemy, lover and hater. These things touch the ego and you are called to be free from ego. These are personal relations and you have to observe all with the deep regard of the impersonal spirit. These are temporal and personal differences which you have to see but not be influenced by them; for you must fix not on these differences but on that which is the same in all, on the one self which all are, on the Divine in every creature and on the one working of Nature which is the equal will of God in men and things and energies and happenings and in all endeavour and

result and whatever outcome of the world's labour.

"Action will still be done in you because Nature is always at work; but you must learn and feel that your self is not the doer of the action. Observe simply, observe unmoved the working of Nature and the play of her qualities and the magic of the gunas. Observe unmoved this action in yourself; look on all that is being done around you and see that it is the same working in others. Observe that the result of your works and theirs is constantly other than you or they desired or intended, not theirs, not yours, but omnipotently fixed by a greater Power that wills and acts here in universal Nature. Observe too that even the will in your works is not yours but Nature's. It is the will of the ego sense in you and is determined by the predominant quality in your composition which she has developed in the past or else brings forward at the moment. It depends on the play of your natural personality and that formation of Nature is not your true person. Draw back from this external formation to your inner silent self; you will see that you the Purusha are inactive, but Nature continues to do always her works according to her gunas. Fix yourself in this inner inactivity and stillness: no longer regard yourself as the doer. Remain seated in yourself above the play, free from the perturbed action of the gunas. Live secure in the purity of an impersonal spirit, live untroubled by the mortal waves that persist in your members.

"If you can do this, then you will find yourself uplifted into a great release, a wide freedom and a deep peace. Then you will be aware of God and immortal, possessed of your dateless self-existence, independent of mind and life and body, sure of your spiritual being, untouched by the reactions of Nature, unstained by passion and sin and pain and sorrow. Then you will depend for your joy and desire on no mortal or outward or worldly thing, but will possess inalienably the self-sufficient delight of a calm and eternal spirit. Then you will have ceased to be a mental creature and will have become spirit illimitable, the Brahman. And into this eternity of the silent self, rejecting from your mind all seed of thought and all root of desire, rejecting the figure of birth in the body, you can pass at your end by concentration in

the pure Eternal and a mighty transference of your consciousness to the Infinite, the Absolute.

*
* *

“This however is not all the truth of the Yoga and this end and way of departure, though a great end and a great way, is not the thing I propose to you. For I am the eternal Worker within you and I ask of you works. I demand of you not a passive consent to a mechanical movement of Nature from which in your self you are wholly separated, indifferent and aloof, but action complete and divine, done as the willing and understanding instrument of the Divine, done for God in you and others and for the good of the world. This action I propose to you, first no doubt as a means of perfection in the supreme spiritual Nature, but as a part too of that perfection. Action is a part of the integral knowledge of God, of his greater mysterious truth and of an entire living in the Divine; action can and should be continued even after perfection and freedom are won. I ask of you the action of the Jivanmukta, the works of the Siddha. Something has to be added to the Yoga already described,—for that was only a first Yoga of knowledge. There is also a Yoga of action in the illumination of God-experience; works can be made one spirit with knowledge. For works done in a total self-vision and God-vision, a vision of God in the world and of the world in God are themselves a movement of knowledge, a movement of light, an indispensable means and an intimate part of spiritual perfection.

“Therefore now to the experience of a high impersonality add too this knowledge that the Supreme whom one meets as the pure silent Self can be met also as a vast dynamic Spirit who originates all works and is Lord of the worlds and the Master of man’s action and endeavour and sacrifice. This apparently self-acting mechanism of Nature conceals an immanent divine Will that compels and guides it and shapes its purposes. But you cannot feel or know that Will while you are shut up in your

narrow cell of personality, blinded and chained to your viewpoint of the ego and its desires. For you can wholly respond to it only when you are impersonalised by knowledge and widened to see all things in the self and in God and the self and God in all things. All becomes here by the power of the Spirit; all do their works by the immanence of God in things and his presence in the heart of every creature. The Creator of the worlds is not limited by his creations; the Lord of works is not bound by his works; the divine Will is not attached to its labour and the results of its labour: for it is omnipotent, all-possessing and all-blissful. But still the Lord looks down on his creations from his transcendence; he descends as the Avatar; he is here in you; he rules from within all things in the steps of their nature. And you too must do works in him, after the way and in the steps of the divine nature, untouched by limitation, attachment or bondage. Act for the best good of all, act for the maintenance of the march of the world, for the support or the leading of its peoples. The action asked of you is the action of the liberated Yогin; it is the spontaneous output of a free and God-held energy, it is an equal-minded movement, it is a selfless and desireless labour.

“The first step on this free, this equal, this divine way of action is to put from you attachment to fruit and recompense and to labour only for the sake of the work itself that has to be done. For you must deeply feel that the fruits belong not to you but to the Master of the world. Consecrate your labour and leave its returns to the Spirit who manifests and fulfils himself in the universal movement. The outcome of your action is determined by his will alone and whatever it be, good or evil fortune, success or failure, it is turned by him to the accomplishment of his world purpose. An entirely desireless and disinterested working of the personal will and the whole instrumental nature is the first rule of Karmayoga. Demand no fruit, accept whatever result is given to you; accept it with equality and a calm gladness: successful or foiled, prosperous or afflicted, continue unafraid, untroubled and unwavering on the steep path of the divine action.

“This is no more than the first step on the path. For you must be not only unattached to results, but unattached also to

your labour. Cease to regard your works as your own; as you have abandoned the fruits of your work, so you must surrender the work also to the Lord of action and sacrifice. Recognise that your nature determines your action; your nature rules the immediate motion of your Swabhava and decides the expressive turn and development of your spirit in the paths of the executive force of Prakriti. Bring in no longer any self-will to confuse the steps of your mind in following the Godward way. Accept the action proper to your nature. Make of all you do from the greatest and most unusual effort to the smallest daily act, make of each act of your mind, each act of your heart, each act of your body, of every inner and outer turn, of every thought and will and feeling, of every step and pause and movement, a sacrifice to the Master of all sacrifice and Tapasya.

"Next know that you are an eternal portion of the Eternal and the powers of your nature are nothing without him, nothing if not his partial self-expression. It is the Divine Infinite that is being progressively fulfilled in your nature. It is the supreme power-to-be, it is the Shakti of the Lord that shapes and takes shape in your swabhava. Give up then all sense that you are the doer; see the Eternal alone as the doer of the action. Let your natural being be an occasion, an instrument, a channel of power, a means of manifestation. Offer up your will to him and make it one with his eternal will: surrender all your actions in the silence of your self and spirit to the transcendent Master of your nature. This cannot be really done or done perfectly so long as there is any ego sense in you or any mental claim or vital clamour. Action done in the least degree for the sake of the ego or tinged with the desire and will of the ego is not a perfect sacrifice. Nor can this great thing be well and truly done so long as there is inequality anywhere or any stamp of ignorant shrinking and preference. But when there is a perfect equality to all works, results, things and persons, a surrender to the Highest and not to desire or ego, then the divine Will determines without stumbling or deflection and the divine Power executes freely without any nether interference or perverting reaction all works in the purity and safety of your transmuted nature. To allow

your every act to be shaped through you by the divine Will in its immaculate sovereignty is the highest degree of the perfection that comes by doing works in Yoga. That done, your nature will follow its cosmic walk in a complete and constant union with the Supreme, express the highest Self, obey the Ishwara.

"This way of divine works is a far better release and a more perfect way and solution than the physical renunciation of life and works. A physical abstention is not entirely possible and is not in the measure of its possibility indispensable to the spirit's freedom; it is besides a dangerous example, for it exerts a misleading influence on ordinary men. The best, the greatest set the standard which the rest of humanity strive to follow. Then since action is the nature of the embodied spirit, since works are the will of the eternal Worker, the great spirits, the master minds should set this example. World-workers should they be, doing all works of the world without reservation, God-workers free, glad and desireless, liberated souls and natures.

*
* * *

"The mind of knowledge and the will of action are not all; there is within you a heart whose demand is for delight. Here too in the heart's power and illumination, in its demand for delight, for the soul's satisfaction your nature must be turned, transformed and lifted to one conscious ecstasy with the Divine. The knowledge of the impersonal self brings its own Ananda; there is a joy of impersonality, a singleness of joy of the pure spirit. But an integral knowledge brings a greater triple delight. It opens the gates of the Transcendent's bliss; it releases into the limitless delight of a universal impersonality; it discovers the rapture of all this multitudinous manifestation: for there is a joy of the Eternal in Nature. This Ananda in the Jiva, a portion here of the Divine, takes the form of an ecstasy founded in the Godhead who is his source, in his supreme self, in the Master of his existence. An entire God-love and adoration extends to a love of the world and all its forms and powers and creatures; in

all the Divine is seen, is found, is adored, is served or is felt in oneness. Add to knowledge and works this crown of the eternal triune delight; admit this love, learn this worship; make it one spirit with works and knowledge. That is the apex of the perfect perfection.

"This Yoga of love will give you a highest potential force for spiritual largeness and unity and freedom. But it must be a love which is one with God-knowledge. There is a devotion which seeks God in suffering for consolation and succour and deliverance; there is a devotion which seeks him for his gifts, for divine aid and protection and as a fountain of the satisfaction of desire; there is a devotion that, still ignorant, turns to him for light and knowledge. And so long as one is limited to these forms, there may persist even in their highest and noblest Godward turn a working of the three gunas. But when the God-lover is also the God-knower, the lover becomes one self with the Beloved; for he is the chosen of the Most High and the elect of the Spirit. Develop in yourself this God-engrossed love; the heart spiritualised and lifted beyond the limitations of its lower nature will reveal to you most intimately the secrets of God's immeasurable being, bring into you the whole touch and influx and glory of his divine Power and open to you the mysteries of an eternal rapture. It is perfect love that is the key to a perfect knowledge.

"This integral God-love demands too an integral work for the sake of the Divine in yourself and in all creatures. The ordinary man does works in obedience to some desire sinful or virtuous, some vital impulse low or high, some mental choice common or exalted or from some mixed mind and life motive. But the work done by you must be free and desireless; work done without desire creates no reaction and imposes no bondage. Done in a perfect equality and an unmoved calm and peace, but without any divine passion, it is at first the fine yoke of a spiritual obligation, *kartavyam karma*, then the uplifting of a divine sacrifice; at its highest it can be the expression of a calm and glad acquiescence in active oneness. The oneness in love will do much more: it will replace the first impassive calm by a strong

and deep rapture, not the petty ardour of egoistic desire but the ocean of an infinite Ananda. It will bring the moving sense and the pure and divine passion of the presence of the Beloved into your works; there will be an insistent joy of labour for God in yourself and for God in all beings. Love is the crown of works and the crown of knowledge.

“This love that is knowledge, this love that can be the deep heart of your action, will be your most effective force for an utter consecration and complete perfection. An integral union of the individual’s being with the Divine Being is the condition of a perfect spiritual life. Turn then altogether towards the Divine; make one with him by knowledge, love and works all your nature. Turn utterly towards him and give up ungrudgingly into his hands your mind and your heart and your will, all your consciousness and even your very senses and body. Let your consciousness be sovereignly moulded by him into a flawless mould of his divine consciousness. Let your heart become a lucid or flaming heart of the Divine. Let your will be an impeccable action of his will. Let your very sense and body be the rapturous sensation and body of the Divine. Adore and sacrifice to him with all you are; remember him in every thought and feeling, every impulsion and act. Persevere until all these things are wholly his and he has taken up even in most common and outward things as in the inmost sacred chamber of your spirit his constant transmuting presence.

*
* *

“This triune way is the means by which you can rise entirely out of your lower into your supreme spiritual nature. That is the hidden superconscious nature in which the Jiva, a portion of the high Infinite and Divine and intimately one in law of being with him, dwells in his Truth and not any longer in an externalised Maya. This perfection, this unity can be enjoyed in its own native status, aloof in a supreme supracosmic existence: but here also you may and should realise it, here in the human body and

physical world. It is not enough for this end to be calm, inactive and free from the gunas in the inner self and to watch and allow indifferently their mechanical action in the outer members. For the active nature as well as the self has to be given to the Divine and to become divine. All that you are must grow into one law of being with the Purushottama, *sādharmya*; all must be changed into my conscious spiritual becoming, *mad-bhāva*. A completest surrender must be there. Take refuge with Me in all the many ways and along all the living lines of your nature; for that alone will bring about this great change and perfection.

"This high consummation of the Yoga will at once solve or rather it will wholly remove and destroy at its roots the problem of action. Human action is a thing full of difficulties and perplexities, tangled and confused like a forest with a few more or less obscure paths cut into it rather than through it; but all this difficulty and entanglement arises from the single fact that man lives imprisoned in the ignorance of his mental, vital and physical nature. He is compelled by its qualities and yet afflicted with responsibility in his will because something in him feels that he is a soul who ought to be what now he is not at all or very little, master and ruler of his nature. All his laws of living, all his dharmas must be under these conditions imperfect, temporary and provisional and at best only partly right or true. His imperfections can cease only when he knows himself, knows the real nature of the world in which he lives and, most of all, knows the Eternal from whom he comes and in whom and by whom he exists. When he has once achieved a true consciousness and knowledge, there is no longer any problem; for then he acts freely out of himself and lives spontaneously in accordance with the truth of his spirit and his highest nature. At its fullest, at the highest height of this knowledge it is not he who acts but the Divine, the One eternal and infinite who acts in him and through him in his liberated wisdom and power and perfection.

"Man in his natural being is a sattwic, rajasic and tamasic creature of Nature. According as one or other of her qualities predominates in him, he makes and follows this or that law

of his life and action. His tamasic, material, sensational mind subject to inertia and fear and ignorance either obeys partly the compulsion of its environment and partly the spasmodic impulses of its desires or finds a protection in the routine following of a dull customary intelligence. The rajasic mind of desire struggles with the world in which it lives and tries to possess always new things, to command, battle, conquer, create, destroy, accumulate. Always it goes forward tossed between success and failure, joy and sorrow, exultation or despair. But in all, whatever law it may seem to admit, it follows really only the law of the lower self and ego, the restless, untired, self-devouring and all-devouring mind of the Asuric and Rakshasic nature. The sattvic intelligence surmounts partly this state, sees that a better law than that of desire and ego must be followed and erects and imposes on itself a social, an ethical, a religious rule, a Dharma, a Shastra. This is as high as the ordinary mind of man can go, to erect an ideal or practical rule for the guidance of the mind and will and as faithfully as possible observe it in life and conduct. This sattvic mind must be developed to its highest point where it succeeds in putting away the mixture of ego motive altogether and observes the Dharma for its own sake as an impersonal social, ethical or religious ideal, the thing disinterestedly to be done solely because it is right, *kartavyam karma*.

"The real truth of all this action of Prakriti is, however, less outwardly mental and more inwardly subjective. It is this that man is an embodied soul involved in material and mental nature, and he follows in it a progressive law of his development determined by an inner law of his being; his cast of spirit makes out his cast of mind and life, his swabhava. Each man has a swadharma, a law of his inner being which he must observe, find out and follow. The action determined by his inner nature, that is his real Dharma. To follow it is the true law of his development; to deviate from it is to bring in confusion, retardation and error. That social, ethical, religious or other law and ideal is best for him always which helps him to observe and follow out his Swadharma.

"All this action however is even at its best subject to the

ignorance of the mind and the play of the gunas. It is only when the soul of man finds itself that he can overpass and erase from his consciousness the ignorance and the confusion of the gunas. It is true that even when you have found yourself and live in your self, your nature will still continue on its old lines and act for a time according to its inferior modes. But now you can follow that action with a perfect self-knowledge and can make of it a sacrifice to the Master of your existence. Follow then the law of your Swadharma, do the action that is demanded by your Swabhava whatever it may be. Reject all motive of egoism, all initiation by self-will, all rule of desire, until you can make the complete surrender of all the ways of your being to the Supreme.

“And when you are once able to do that sincerely, that will be the moment to renounce the initiation of your acts without exception into the hands of the supreme Godhead within you. Then you will be released from all laws of conduct, liberated from all dharmas. The Divine Power and Presence within you will free you from sin and evil and lift you far above human standards of virtue. For you will live and act in the absolute and spontaneous right and purity of the spiritual being and the immaculate force of the divine nature. The Divine and not you will enact his own will and works through you, not for your lower personal pleasure and desire, but for the world-purpose and for your divine good and the manifest or secret good of all. Inundated with light, you will see the form of the Godhead in the world and in the works of Time, know his purpose and hear his command. Your nature will receive as an instrument his will only whatever it may be and do it without question, because there will come with each initiation of your acts from above and within you an imperative knowledge and an illumined assent to the divine wisdom and its significance. The battle will be his, his the victory, his the empire.

“This will be your perfection in the world and the body, and beyond these worlds of temporal birth the supreme eternal superconsciousness will be yours and you will dwell for ever in the highest status of the Supreme Spirit. The cycles of incarnation and the fear of mortality will not distress you; for here in life

you will have accomplished the expression of the Godhead, and your soul, even though it has descended into mind and body, will already be living in the vast eternity of the Spirit.

“This then is the supreme movement, this complete surrender of your whole self and nature, this abandonment of all dharmas to the Divine who is your highest Self, this absolute aspiration of all your members to the supreme spiritual nature. If you can once achieve it, whether at the outset or much later on the way, then whatever you are or were in your outward nature, your way is sure and your perfection inevitable. A supreme Presence within you will take up your Yoga and carry it swiftly along the lines of your swabhava to its consummate completion. And afterwards whatever your way of life and mode of action, you will be consciously living, acting and moving in him and the Divine Power will act through you in your every inner and outer motion. This is the supreme way because it is the highest secret and mystery and yet an inner movement progressively realisable by all. This is the deepest and most intimate truth of your real, your spiritual existence.”

THE END

Note on the Text

ESSAYS ON THE GITA was first published in the monthly review *Arya* in two series. The first series, covering the first six chapters of the Gita, ran from August 1916 to July 1918. The second series, covering the last twelve chapters, ran from August 1918 to July 1920.

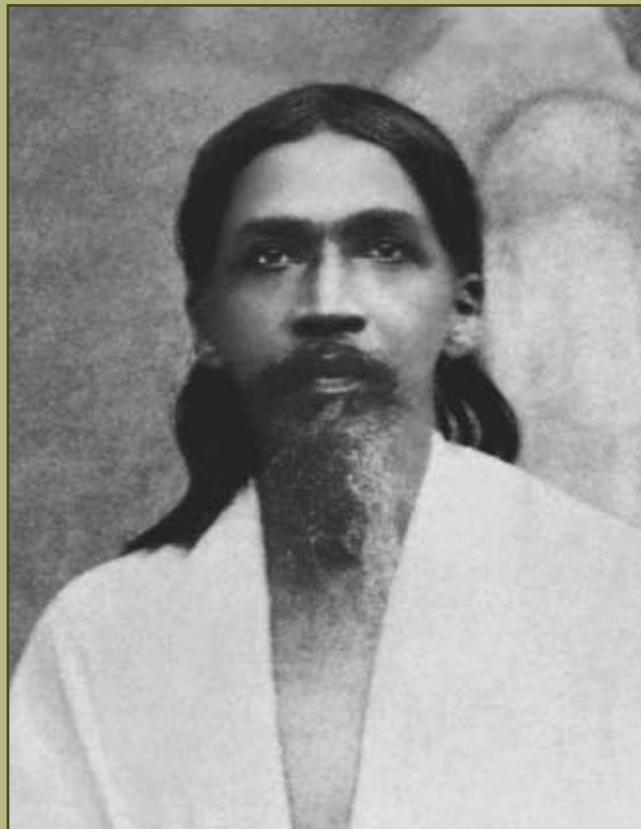

The first series, slightly revised and with some new chapter titles, was brought out as a book in 1922 by V. Ramaswamy Sastrulu and Sons, Madras. New editions of the first series were published by Arya Publishing House, Calcutta, in 1926, 1937, 1944 and 1949. The same publisher issued an extensively revised edition of the second series in 1928, and new editions of this series in 1942, 1945 and 1949.

The 1922 edition of the first series may be considered an incomplete first edition of *Essays on the Gita*. The first and second series pairs of 1926 and 1928, 1937 and 1942, 1944 and 1945, and 1949 (both series) may be considered the second, third, fourth and fifth editions of the book.

Since 1949 the two series of *Essays on the Gita* have appeared in one volume. An American edition was published by The Sri Aurobindo Library, New York, in 1950. The sixth and seventh Indian editions were published by the Sri Aurobindo International Centre of Education in 1959 and 1966. In 1970 *Essays on the Gita* formed volume 13 of the Sri Aurobindo Birth Centenary Library. This, the eighth Indian edition, was reprinted many times.

The text of the present, ninth, edition has been carefully checked against Sri Aurobindo's extant manuscripts and all editions published before 1950.

The Renaissance in India

with

A Defence of Indian Culture

Publisher's Note

Most of the essays that make up this volume have appeared until now under the title *The Foundations of Indian Culture*. That title was not Sri Aurobindo's. It was first used when those essays were published as a book in New York in 1953.

The present volume consists of three series of essays and one single essay, published in the monthly review *Arya* as follows:

The Renaissance in India, August–November 1918.
Indian Culture and External Influence, March 1919.
“*Is India Civilised?*”, December 1918–February 1919.
A Defence of Indian Culture, February 1919–January 1921.

Sri Aurobindo revised the four essays making up *The Renaissance in India* and published them as a booklet in 1920. He later revised “*Is India Civilised?*” and the first eight and a half chapters of *A Defence of Indian Culture*. These revised chapters were not published during his lifetime. In 1947 some of the later chapters of *A Defence of Indian Culture*, lightly revised, were published in two booklets. The four essays on Indian art appeared as *The Significance of Indian Art* and the four essays on Indian polity as *The Spirit and Form of Indian Polity*. The rest of the series was only sporadically revised. When its publication was proposed to him in 1949, Sri Aurobindo replied:

The Defence of Indian Culture is an unfinished book and also I had intended to alter much of it and to omit all but brief references to William Archer's criticisms. That was why its publication has been so long delayed. Even if it is reprinted as it is considerable alterations will have to be made and there must be some completion and an end to the book which does not at present exist.

The desired alterations were never made.

The text of the present edition has been checked against the *Arya* and the revised versions.

A number of photographic reproductions of Indian architecture, sculpture and painting have been included to illustrate references in the text.

The Renaissance in India

The Renaissance in India

THREE has been recently some talk of a Renaissance in India. A number of illuminating essays with that general title and subject have been given to us by a poet and subtle critic and thinker, Mr. James H. Cousins, and others have touched suggestively various sides of the growing movement towards a new life and a new thought that may well seem to justify the description. This Renaissance, this new birth in India, if it is a fact, must become a thing of immense importance both to herself and the world, to herself because of all that is meant for her in the recovery or the change of her time-old spirit and national ideals, to the world because of the possibilities involved in the rearising of a force that is in many respects unlike any other and its genius very different from the mentality and spirit that have hitherto governed the modern idea in mankind, although not so far away perhaps from that which is preparing to govern the future. It is rather the first point of view that I shall put forward at present: for the question what India means to make of her own life must precede the wider question what her new life may mean to the human race. And it is besides likely to become before long an issue of a pressing importance.

There is a first question, whether at all there is really a Renaissance in India. That depends a good deal on what we mean by the word; it depends also on the future, for the thing itself is only in its infancy and it is too early to say to what it may lead. The word carries the mind back to the turning-point of European culture to which it was first applied; that was not so much a reawakening as an overturn and reversal, a seizure of Christianised, Teutonised, feudalised Europe by the old Graeco-Latin spirit and form with all the complex and momentous results which came from it. That is certainly not a type of renaissance that is at all possible in India. There is

a closer resemblance to the recent Celtic movement in Ireland, the attempt of a reawakened national spirit to find a new impulse of self-expression which shall give the spiritual force for a great reshaping and rebuilding: in Ireland this was discovered by a return to the Celtic spirit and culture after a long period of eclipsing English influences, and in India something of the same kind of movement is appearing and has especially taken a pronounced turn since the political outburst of 1905. But even here the analogy does not give the whole truth.

We have to see moreover that the whole is at present a great formless chaos of conflicting influences with a few luminous points of formation here and there where a new self-consciousness has come to the surface. But it cannot be said that these forms have yet a sufficient hold on the general mind of the people. They represent an advance movement; they are the voices of the vanguard, the torchlights of the pioneers. On the whole what we see is a giant Shakti who awakening into a new world, a new and alien environment, finds herself shackled in all her limbs by a multitude of gross or minute bonds, bonds self-woven by her past, bonds recently imposed from outside, and is struggling to be free from them, to arise and proclaim herself, to cast abroad her spirit and set her seal on the world. We hear on every side a sound of the slow fraying of bonds, here and there a sharp tearing and snapping; but freedom of movement has not yet been attained. The eyes are not yet clear, the bud of the soul has only partly opened. The Titaness has not yet arisen.

Mr. Cousins puts the question in his book whether the word renaissance at all applies since India has always been awake and stood in no need of reawakening. There is a certain truth behind that and to one coming in with a fresh mind from outside and struck by the living continuity of past and present India, it may be especially apparent; but that is not quite how we can see it who are her children and are still suffering from the bitter effects of the great decline which came to a head in the eighteenth and nineteenth centuries. Undoubtedly there was a period, a brief but very disastrous period of the dwindling of that great fire of life, even a moment of incipient disintegration, marked politically by

the anarchy which gave European adventure its chance, inwardly by an increasing torpor of the creative spirit in religion and art,—science and philosophy and intellectual knowledge had long been dead or petrified into a mere scholastic Punditism,—all pointing to a nadir of setting energy, the evening-time from which according to the Indian idea of the cycles a new age has to start. It was that moment and the pressure of a superimposed European culture which followed it that made the reawakening necessary.

We have practically to take three facts into consideration, the great past of Indian culture and life with the moment of inadaptive torpor into which it had lapsed, the first period of the Western contact in which it seemed for a moment likely to perish by slow decomposition, and the ascending movement which first broke into some clarity of expression only a decade or two ago. Mr. Cousins has his eye fixed on Indian spirituality which has always maintained itself even in the decline of the national vitality; it was certainly that which saved India always at every critical moment of her destiny, and it has been the starting-point too of her renascence. Any other nation under the same pressure would have long ago perished soul and body. But certainly the outward members were becoming gangrened; the powers of renovation seemed for a moment to be beaten by the powers of stagnation, and stagnation is death. Now that the salvation, the reawakening has come, India will certainly keep her essential spirit, will keep her characteristic soul, but there is likely to be a great change of the body. The shaping for itself of a new body, of new philosophical, artistic, literary, cultural, political, social forms by the same soul rejuvenescent will, I should think, be the type of the Indian renascence,—forms not contradictory of the truths of life which the old expressed, but rather expressive of those truths restated, cured of defect, completed.

What was this ancient spirit and characteristic soul of India? European writers, struck by the general metaphysical bent of the Indian mind, by its strong religious instincts and religious idealism, by its other-worldliness, are inclined to write as if this

were all the Indian spirit. An abstract, metaphysical, religious mind overpowered by the sense of the infinite, not apt for life, dreamy, unpractical, turning away from life and action as Maya, this, they said, is India; and for a time Indians in this as in other matters submissively echoed their new Western teachers and masters. They learned to speak with pride of their metaphysics, of their literature, of their religion, but in all else they were content to be learners and imitators. Since then Europe has discovered that there was too an Indian art of remarkable power and beauty; but the rest of what India meant it has hardly at all seen. But meanwhile the Indian mind began to emancipate itself and to look upon its past with a clear and self-discerning eye, and it very soon discovered that it had been misled into an entirely false self-view. All such one-sided appreciations indeed almost invariably turn out to be false. Was it not the general misconception about Germany at one time, because she was great in philosophy and music, but had blundered in life and been unable to make the most of its materials, that this was a nation of unpractical dreamers, idealists, erudites and sentimentalists, patient, docile and industrious certainly, but politically inapt, — “admirable, ridiculous Germany”? Europe has had a terrible awakening from that error. When the renascence of India is complete, she will have an awakening, not of the same brutal kind, certainly, but startling enough, as to the real nature and capacity of the Indian spirit.

Spirituality is indeed the master-key of the Indian mind; the sense of the infinite is native to it. India saw from the beginning, — and, even in her ages of reason and her age of increasing ignorance, she never lost hold of the insight,— that life cannot be rightly seen in the sole light, cannot be perfectly lived in the sole power of its externalities. She was alive to the greatness of material laws and forces; she had a keen eye for the importance of the physical sciences; she knew how to organise the arts of ordinary life. But she saw that the physical does not get its full sense until it stands in right relation to the supra-physical; she saw that the complexity of the universe could not be explained in the present terms of man or seen by his superficial sight, that

there were other powers behind, other powers within man himself of which he is normally unaware, that he is conscious only of a small part of himself, that the invisible always surrounds the visible, the suprasensible the sensible, even as infinity always surrounds the finite. She saw too that man has the power of exceeding himself, of becoming himself more entirely and profoundly than he is,—truths which have only recently begun to be seen in Europe and seem even now too great for its common intelligence. She saw the myriad gods beyond man, God beyond the gods, and beyond God his own ineffable eternity; she saw that there were ranges of life beyond our life, ranges of mind beyond our present mind and above these she saw the splendours of the spirit. Then with that calm audacity of her intuition which knew no fear or littleness and shrank from no act whether of spiritual or intellectual, ethical or vital courage, she declared that there was none of these things which man could not attain if he trained his will and knowledge; he could conquer these ranges of mind, become the spirit, become a god, become one with God, become the ineffable Brahman. And with the logical practicality and sense of science and organised method which distinguished her mentality, she set forth immediately to find out the way. Hence from long ages of this insight and practice there was ingrained in her her spirituality, her powerful psychic tendency, her great yearning to grapple with the infinite and possess it, her ineradicable religious sense, her idealism, her Yoga, the constant turn of her art and her philosophy.

But this was not and could not be her whole mentality, her entire spirit; spirituality itself does not flourish on earth in the void, even as our mountaintops do not rise like those of an enchantment of dream out of the clouds without a base. When we look at the past of India, what strikes us next is her stupendous vitality, her inexhaustible power of life and joy of life, her almost unimaginably prolific creativeness. For three thousand years at least,—it is indeed much longer,—she has been creating abundantly and incessantly, lavishly, with an inexhaustible many-sidedness, republics and kingdoms and empires, philosophies and cosmogonies and sciences and creeds and arts and poems

and all kinds of monuments, palaces and temples and public works, communities and societies and religious orders, laws and codes and rituals, physical sciences, psychic sciences, systems of Yoga, systems of politics and administration, arts spiritual, arts worldly, trades, industries, fine crafts, — the list is endless and in each item there is almost a plethora of activity. She creates and creates and is not satisfied and is not tired; she will not have an end of it, seems hardly to need a space for rest, a time for inertia and lying fallow. She expands too outside her borders; her ships cross the ocean and the fine superfluity of her wealth brims over to Judaea and Egypt and Rome; her colonies spread her arts and epics and creeds in the Archipelago; her traces are found in the sands of Mesopotamia; her religions conquer China and Japan and spread westward as far as Palestine and Alexandria, and the figures of the Upanishads and the sayings of the Buddhists are reechoed on the lips of Christ. Everywhere, as on her soil, so in her works there is the teeming of a superabundant energy of life. European critics complain that in her ancient architecture, sculpture and art there is no reticence, no holding back of riches, no blank spaces, that she labours to fill every rift with ore, occupy every inch with plenty. Well, but defect or no, that is the necessity of her superabundance of life, of the teeming of the infinite within her. She lavishes her riches because she must, as the Infinite fills every inch of space with the stirring of life and energy because it is the Infinite.

But this supreme spirituality and this prolific abundance of the energy and joy of life and creation do not make all that the spirit of India has been in its past. It is not a confused splendour of tropical vegetation under heavens of a pure sapphire infinity. It is only to eyes unaccustomed to such wealth that there seems to be a confusion in this crowding of space with rich forms of life, a luxurious disorder of excess or a wanton lack of measure, clear balance and design. For the third power of the ancient Indian spirit was a strong intellectuality, at once austere and rich, robust and minute, powerful and delicate, massive in principle and curious in detail. Its chief impulse was that of order and arrangement, but an order founded upon a seeking for the inner

law and truth of things and having in view always the possibility of conscientious practice. India has been preeminently the land of the Dharma and the Shastra. She searched for the inner truth and law of each human or cosmic activity, its dharma; that found, she laboured to cast into elaborate form and detailed law of arrangement its application in fact and rule of life. Her first period was luminous with the discovery of the Spirit; her second completed the discovery of the Dharma; her third elaborated into detail the first simpler formulation of the Shastra; but none was exclusive, the three elements are always present.

In this third period the curious elaboration of all life into a science and an art assumes extraordinary proportions. The mere mass of the intellectual production during the period from Asoka well into the Mahomedan epoch is something truly prodigious, as can be seen at once if one studies the account which recent scholarship gives of it, and we must remember that that scholarship as yet only deals with a fraction of what is still lying extant and what is extant is only a small percentage of what was once written and known. There is no historical parallel for such an intellectual labour and activity before the invention of printing and the facilities of modern science; yet all that mass of research and production and curiosity of detail was accomplished without these facilities and with no better record than the memory and for an aid the perishable palm-leaf. Nor was all this colossal literature confined to philosophy and theology, religion and Yoga, logic and rhetoric and grammar and linguistics, poetry and drama, medicine and astronomy and the sciences; it embraced all life, politics and society, all the arts from painting to dancing, all the sixty-four accomplishments, everything then known that could be useful to life or interesting to the mind, even, for instance, to such practical side minutiae as the breeding and training of horses and elephants, each of which had its Shastra and its art, its apparatus of technical terms, its copious literature. In each subject from the largest and most momentous to the smallest and most trivial there was expended the same all-embracing, opulent, minute and thorough intellectuality. On one side there is an insatiable curiosity, the desire of life to know

itself in every detail, on the other a spirit of organisation and scrupulous order, the desire of the mind to tread through life with a harmonised knowledge and in the right rhythm and measure. Thus an ingrained and dominant spirituality, an inexhaustible vital creativeness and gust of life and, mediating between them, a powerful, penetrating and scrupulous intelligence combined of the rational, ethical and aesthetic mind each at a high intensity of action, created the harmony of the ancient Indian culture.

Indeed without this opulent vitality and opulent intellectuality India could never have done so much as she did with her spiritual tendencies. It is a great error to suppose that spirituality flourishes best in an impoverished soil with the life half-killed and the intellect discouraged and intimidated. The spirituality that so flourishes is something morbid, hectic and exposed to perilous reactions. It is when the race has lived most richly and thought most profoundly that spirituality finds its heights and its depths and its constant and many-sided fruition. In modern Europe it is after a long explosion of vital force and a stupendous activity of the intellect that spirituality has begun really to emerge and with some promise of being not, as it once was, the sorrowful physician of the malady of life, but the beginning of a large and profound clarity. The European eye is struck in Indian spiritual thought by the Buddhistic and illusionist denial of life. But it must be remembered that this is only one side of its philosophic tendency which assumed exaggerated proportions only in the period of decline. In itself too that was simply one result, in one direction, of a tendency of the Indian mind which is common to all its activities, the impulse to follow each motive, each specialisation of motive even, spiritual, intellectual, ethical, vital, to its extreme point and to sound its utmost possibility. Part of its innate direction was to seek in each not only for its fullness of detail, but for its infinite, its absolute, its profoundest depth or its highest pinnacle. It knew that without a "fine excess" we cannot break down the limits which the dull temper of the normal mind opposes to knowledge and thought and experience; and it had in seeking this point a boundless courage and yet a sure tread. Thus it carried each tangent of philosophic thought,

each line of spiritual experience to its farthest point, and chose to look from that farthest point at all existence, so as to see what truth or power such a view could give it. It tried to know the whole of divine nature and to see too as high as it could beyond nature and into whatever there might be of supradivine. When it formulated a spiritual atheism, it followed that to its acme of possible vision. When, too, it indulged in materialistic atheism,—though it did that only with a side glance, as the freak of an insatiable intellectual curiosity,—yet it formulated it straight out, boldly and nakedly, without the least concession to idealism or ethicism.

Everywhere we find this tendency. The ideals of the Indian mind have included the height of self-assertion of the human spirit and its thirst of independence and mastery and possession and the height also of its self-abnegation, dependence and submission and self-giving. In life the ideal of opulent living and the ideal of poverty were carried to the extreme of regal splendour and the extreme of satisfied nudity. Its intuitions were sufficiently clear and courageous not to be blinded by its own most cherished ideas and fixed habits of life. If it was obliged to stereotype caste as the symbol of its social order, it never quite forgot, as the caste-spirit is apt to forget, that the human soul and the human mind are beyond caste. For it had seen in the lowest human being the Godhead, Narayana. It emphasised distinctions only to turn upon them and deny all distinctions. If all its political needs and circumstances compelled it at last to exaggerate the monarchical principle and declare the divinity of the king and to abolish its earlier republican city states and independent federations as too favourable to the centrifugal tendency, if therefore it could not develop democracy, yet it had the democratic idea, applied it in the village, in council and municipality, within the caste, was the first to assert a divinity in the people and could cry to the monarch at the height of his power, "O king, what art thou but the head servant of the demos?" Its idea of the golden age was a free spiritual anarchism. Its spiritual extremism could not prevent it from fathoming through a long era the life of the senses and its enjoyments, and there too it sought the utmost

richness of sensuous detail and the depths and intensities of sensuous experience. Yet it is notable that this pursuit of the most opposite extremes never resulted in disorder; and its most hedonistic period offers nothing that at all resembles the unbridled corruption which a similar tendency has more than once produced in Europe. For the Indian mind is not only spiritual and ethical, but intellectual and artistic, and both the rule of the intellect and the rhythm of beauty are hostile to the spirit of chaos. In every extreme the Indian spirit seeks for a law in that extreme and a rule, measure and structure in its application. Besides, this sounding of extremes is balanced by a still more ingrained characteristic, the synthetical tendency, so that having pushed each motive to its farthest possibility the Indian mind returns always towards some fusion of the knowledge it has gained and to a resulting harmony and balance in action and institution. Balance and rhythm which the Greeks arrived at by self-limitation, India arrived at by its sense of intellectual, ethical and aesthetic order and the synthetic impulse of its mind and life.

I have dwelt on these facts because they are apt to be ignored by those who look only at certain sides of the Indian mind and spirit which are most prominent in the last epochs. By insisting only upon these we get an inaccurate or incomplete idea of the past of India and of the integral meaning of its civilisation and the spirit that animated it. The present is only a last deposit of the past at a time of ebb; it has no doubt also to be the starting-point of the future, but in this present all that was in India's past is still dormant, it is not destroyed; it is waiting there to assume new forms. The decline was the ebb-movement of a creative spirit which can only be understood by seeing it in the full tide of its greatness; the renascence is the return of the tide and it is the same spirit that is likely to animate it, although the forms it takes may be quite new. To judge therefore the possibilities of the renascence, the powers that it may reveal and the scope that it may take, we must dismiss the idea that the tendency of metaphysical abstraction is the one note of the Indian spirit which dominates or inspires all its cadences. Its real

key-note is the tendency of spiritual realisation, not cast at all into any white monotone, but many-faceted, many-coloured, as supple in its adaptability as it is intense in its highest pitches. The note of spirituality is dominant, initial, constant, always recurrent; it is the support of all the rest. The first age of India's greatness was a spiritual age when she sought passionately for the truth of existence through the intuitive mind and through an inner experience and interpretation both of the psychic and the physical existence. The stamp put on her by that beginning she has never lost, but rather always enriched it with fresh spiritual experience and discovery at each step of the national life. Even in her hour of decline it was the one thing she could never lose.

But this spiritual tendency does not shoot upward only to the abstract, the hidden and the intangible; it casts its rays downward and outward to embrace the multiplicities of thought and the richness of life. Therefore the second long epoch of India's greatness was an age of the intellect, the ethical sense, the dynamic will in action enlightened to formulate and govern life in the lustre of spiritual truth. After the age of the Spirit, the age of the Dharma; after the Veda and Upanishads, the heroic centuries of action and social formation, typal construction and thought and philosophy, when the outward forms of Indian life and culture were fixed in their large lines and even their later developments were being determined in the seed. The great classical age of Sanskrit culture was the flowering of this intellectuality into curiosity of detail in the refinements of scholarship, science, art, literature, politics, sociology, mundane life. We see at this time too the sounding not only of aesthetic, but of emotional and sensuous, even of vital and sensual experience. But the old spirituality reigned behind all this mental and all this vital activity, and its later period, the post-classical, saw a lifting up of the whole lower life and an impressing upon it of the values of the spirit. This was the sense of the Puranic and Tantric systems and the religions of Bhakti. Later Vaishnavism, the last fine flower of the Indian spirit, was in its essence the taking up of the aesthetic, emotional and sensuous being into the service of the spiritual. It completed the curve of the cycle.

The evening of decline which followed the completion of the curve was prepared by three movements of retrogression. First there is, comparatively, a sinking of that superabundant vital energy and a fading of the joy of life and the joy of creation. Even in the decline this energy is still something splendid and extraordinary and only for a very brief period sinks nearest to a complete torpor; but still a comparison with its past greatness will show that the decadence was marked and progressive. Secondly, there is a rapid cessation of the old free intellectual activity, a slumber of the scientific and the critical mind as well as the creative intuition; what remains becomes more and more a repetition of ill-understood fragments of past knowledge. There is a petrification of the mind and life in the relics of the forms which a great intellectual past had created. Old authority and rule become rigidly despotic and, as always then happens, lose their real sense and spirit. Finally, spirituality remains but burns no longer with the large and clear flame of knowledge of former times, but in intense jets and in a dispersed action which replaces the old magnificent synthesis and in which certain spiritual truths are emphasised to the neglect of others. This diminution amounts to a certain failure of the great endeavour which is the whole meaning of Indian culture, a falling short in the progress towards the perfect spiritualisation of the mind and the life. The beginnings were superlative, the developments very great, but at a certain point where progress, adaptation, a new flowering should have come in, the old civilisation stopped short, partly drew back, partly lost its way. The essential no doubt remained and still remains in the heart of the race and not only in its habits and memories, but in its action it was covered up in a great smoke of confusion. The causes internal and external we need not now discuss; but the fact is there. It was the cause of the momentary helplessness of the Indian mind in the face of new and unprecedented conditions.

It was at this moment that the European wave swept over India. The first effect of this entry of a new and quite opposite civilisation was the destruction of much that had no longer the

power to live, the deliquescence of much else, a tendency to the devitalisation of the rest. A new activity came in, but this was at first crudely and confusedly imitative of the foreign culture. It was a crucial moment and an ordeal of perilous severity; a less vigorous energy of life might well have foundered and perished under the double weight of the deadening of its old innate motives and a servile imitation of alien ideas and habits. History shows us how disastrous this situation can be to nations and civilisations. But fortunately the energy of life was there, sleeping only for a moment, not dead, and, given that energy, the evil carried within itself its own cure. For whatever temporary rotting and destruction this crude impact of European life and culture has caused, it gave three needed impulses. It revived the dormant intellectual and critical impulse; it rehabilitated life and awakened the desire of new creation; it put the reviving Indian spirit face to face with novel conditions and ideals and the urgent necessity of understanding, assimilating and conquering them. The national mind turned a new eye on its past culture, reawoke to its sense and import, but also at the same time saw it in relation to modern knowledge and ideas. Out of this awakening vision and impulse the Indian renaissance is arising, and that must determine its future tendency. The recovery of the old spiritual knowledge and experience in all its splendour, depth and fullness is its first, most essential work; the flowing of this spirituality into new forms of philosophy, literature, art, science and critical knowledge is the second; an original dealing with modern problems in the light of the Indian spirit and the endeavour to formulate a greater synthesis of a spiritualised society is the third and most difficult. Its success on these three lines will be the measure of its help to the future of humanity.

The Spirit is a higher infinite of verities; life is a lower infinite of possibilities which seek to grow and find their own truth and fulfilment in the light of these verities. Our intellect, our will, our ethical and our aesthetic being are the reflectors and the mediators. The method of the West is to exaggerate life and to call down as much—or as little—as may be of the higher powers

to stimulate and embellish life.¹ But the method of India is on the contrary to discover the spirit within and the higher hidden intensities of the superior powers and to dominate life in one way or another so as to make it responsive to and expressive of the spirit and in that way increase the power of life. Its tendency with the intellect, will, ethical, aesthetic and emotional being is to sound indeed their normal mental possibilities, but also to upraise them towards the greater light and power of their own highest intuitions. The work of the renaissance in India must be to make this spirit, this higher view of life, this sense of deeper potentiality once more a creative, perhaps a dominant power in the world. But to that truth of itself it is as yet only vaguely awake; the mass of Indian action is still at the moment proceeding under the impress of the European motive and method and, because there is a spirit within us to which they are foreign, the action is poor in will, feeble in form and ineffective in results, for it does not come from the roots of our being. Only in a few directions is there some clear light of self-knowledge. It is when a greater light prevails and becomes general that we shall be able to speak, not only in prospect but in fact, of the renaissance of India.

¹ Mr. Cousins' distinction between invocation and evocation.

The Renaissance in India – 2

THE PROCESS which has led up to the renaissance now inevitable, may be analysed, both historically and logically, into three steps by which a transition is being managed, a complex breaking, reshaping and new building, with the final result yet distant in prospect,—though here and there the first bases may have been already laid,—a new age of an old culture transformed, not an affiliation of a new-born civilisation to one that is old and dead, but a true rebirth, a renascence. The first step was the reception of the European contact, a radical reconsideration of many of the prominent elements and some revolutionary denial of the very principles of the old culture. The second was a reaction of the Indian spirit upon the European influence, sometimes with a total denial of what it offered and a stressing both of the essential and the strict letter of the national past, which yet masked a movement of assimilation. The third, only now beginning or recently begun, is rather a process of new creation in which the spiritual power of the Indian mind remains supreme, recovers its truths, accepts whatever it finds sound or true, useful or inevitable of the modern idea and form, but so transmutes and Indianises it, so absorbs and so transforms it entirely into itself that its foreign character disappears and it becomes another harmonious element in the characteristic working of the ancient goddess, the Shakti of India mastering and taking possession of the modern influence, no longer possessed or overcome by it.

Nothing in the many processes of Nature, whether she deals with men or with things, comes by chance or accident or is really at the mercy of external causes. What things are inwardly, determines the course of even their most considerable changes; and timeless India being what she is, the complexity of this transition was predestined and unavoidable. It was impossible that

she should take a rapid wholesale imprint of Western motives and their forms and leave the ruling motives of her own past to accommodate themselves to the foreign change as best they could afterwards. A swift transformation scene like that which brought into being a new modernised Japan, would have been out of the question for her, even if the external circumstances had been equally favourable. For Japan lives centrally in her temperament and in her aesthetic sense, and therefore she has always been rapidly assimilative; her strong temperamental persistence has been enough to preserve her national stamp and her artistic vision a sufficient power to keep her soul alive. But India lives centrally in the spirit, with less buoyancy and vivacity and therefore with a less ready adaptiveness of creation, but a greater, intenser, more brooding depth; her processes are apt to be deliberate, uncertain and long because she has to take things into that depth and from its profoundest inwardness to modify or remould the more outward parts of her life. And until that has been done, the absorption completed, the powers of the remoulding determined, she cannot yet move forward with an easier step on the new way she is taking. From the complexity of the movement arises all the difficulty of the problems she has to face and the rather chaotic confusion of the opinions, standpoints and tendencies that have got entangled in the process, which prevents any easy, clear and decided development, so that we seem to be advancing under a confused pressure of circumstance or in a series of shifting waves of impulsion, this ebbing for that to arise, rather than with any clear idea of our future direction. But here too lies the assurance that once the inner direction has found its way and its implications have come to the surface, the result will be no mere Asiatic modification of Western modernism, but some great, new and original thing of the first importance to the future of human civilisation.

This was not the idea of the earliest generation of intellectuals, few in number but powerful by their talent and originative vigour, that arose as the first result of Western education in India. Theirs was the impatient hope of a transformation such as took place afterwards with so striking a velocity in Japan;

they saw in welcome prospect a new India modernised wholesale and radically in mind, spirit and life. Intensely patriotic in motive, they were yet denationalised in their mental attitude. They admitted practically, if not in set opinion, the occidental view of our past culture as only a half-civilisation and their governing ideals were borrowed from the West or at least centrally inspired by the purely Western spirit and type of their education. From mediaeval India they drew away in revolt and inclined to discredit and destroy whatever it had created; if they took anything from it, it was as poetic symbols to which they gave a superficial and modern significance. To ancient India they looked back on the contrary with a sentiment of pride, at least in certain directions, and were willing to take from it whatever material they could subdue to their new standpoint, but they could not quite grasp anything of it in its original sense and spirit and strove to rid it of all that would not square with their Westernised intellectuality. They sought for a bare, simplified and rationalised religion, created a literature which imported very eagerly the forms, ideas and whole spirit of their English models,—the value of the other arts was almost entirely ignored,—put their political faith and hope in a wholesale assimilation or rather an exact imitation of the middle-class pseudo-democracy of nineteenth-century England, would have revolutionised Indian society by introducing into it all the social ideas and main features of the European form. Whatever value for the future there may be in the things they grasped at with this eager conviction, their method was, as we now recognise, a false method,—an anglicised India is a thing we can no longer view as either possible or desirable,—and it could only, if pursued to the end, have made us painful copyists, clumsy followers always stumbling in the wake of European evolution and always fifty years behind it. This movement of thought did not and could not endure; something of it still continues, but its engrossing power has passed away beyond any chance of vigorous revival.

Nevertheless, this earliest period of crude reception left behind it results that were of value and indeed indispensable to a powerful renaissance. We may single out three of them as

of the first order of importance. It reawakened a free activity of the intellect which, though at first confined within very narrow bounds and derivative in its ideas, is now spreading to all subjects of human and national interest and is applying itself with an increasing curiosity and a growing originality to every field it seizes. This is bringing back to the Indian mind its old unresting thirst for all kinds of knowledge and must restore to it before long the width of its range and the depth and flexible power of its action; and it has opened to it the full scope of the critical faculty of the human mind, its passion for exhaustive observation and emancipated judgment which, in older times exercised only by a few and within limits, has now become an essential equipment of the intellect. These things the imitative period did not itself carry very far, but it cast the germ which we now see beginning to fructify more richly. Secondly, it threw definitely the ferment of modern ideas into the old culture and fixed them before our view in such a way that we are obliged to reckon and deal with them in far other sort than would have been possible if we had simply proceeded from our old fixed traditions without some such momentary violent break in our customary view of things. Finally, it made us turn our look upon all that our past contains with new eyes which have not only enabled us to recover something of their ancient sense and spirit, long embedded and lost in the unintelligent practice of received forms, but to bring out of them a new light which gives to the old truths fresh aspects and therefore novel potentialities of creation and evolution. That in this first period we misunderstood our ancient culture, does not matter; the enforcement of a reconsideration, which even orthodox thought has been obliged to accept, is the fact of capital importance.

The second period of reaction of the Indian mind upon the new elements, its movement towards a recovery of the national poise, has helped us to direct these powers and tendencies into sounder and much more fruitful lines of action. For the anglicising impulse was very soon met by the old national spirit and began to be heavily suffused by its influence. It is now a very small and always dwindling number of our present-day

intellectuals who still remain obstinately Westernised in their outlook; and even these have given up the attitude of blatant and uncompromising depreciation of the past which was at one time a common pose. A larger number have proceeded by a constantly increasing suffusion of their modernism with much of ancient motive and sentiment, a better insight into the meaning of Indian things and their characteristics, a free acceptance more of their spirit than of their forms and an attempt at new interpretation. At first the central idea still remained very plainly of the modern type and betrayed everywhere the Western inspiration, but it drew to itself willingly the ancient ideas and it coloured itself more and more with their essential spirit; and latterly this suffusing element has overflowed, has tended more and more to take up and subdue the original motives until the thought and spirit, turn and tinge are now characteristically Indian. The works of Bankim Chandra Chatterji and Tagore, the two minds of the most distinctive and original genius in our recent literature, illustrate the stages of this transition.

Side by side with this movement and more characteristic and powerful there has been flowing an opposite current. This first started on its way by an integral reaction, a vindication and reacceptance of everything Indian as it stood and because it was Indian. We have still waves of this impulse and many of its influences continuing among us; for its work is not yet completed. But in reality the reaction marks the beginning of a more subtle assimilation and fusing; for in vindicating ancient things it has been obliged to do so in a way that will at once meet and satisfy the old mentality and the new, the traditional and the critical mind. This in itself involves no mere return, but consciously or unconsciously hastens a restatement. And the riper form of the return has taken as its principle a synthetical restatement; it has sought to arrive at the spirit of the ancient culture and, while respecting its forms and often preserving them to revivify, has yet not hesitated also to remould, to reject the outworn and to admit whatever new motive seemed assimilable to the old spirituality or apt to widen the channel of its larger evolution. Of this freer dealing with past and present, this preservation

by reconstruction Vivekananda was in his life-time the leading exemplar and the most powerful exponent.

But this too could not be the end; of itself it leads towards a principle of new creation. Otherwise the upshot of the double current of thought and tendency might be an incongruous assimilation, something in the mental sphere like the strangely assorted half-European, half-Indian dress which we now put upon our bodies. India has to get back entirely to the native power of her spirit at its very deepest and to turn all the needed strengths and aims of her present and future life into materials for that spirit to work upon and integrate and harmonise. Of such vital and original creation we may cite the new Indian art as a striking example. The beginning of this process of original creation in every sphere of her national activity will be the sign of the integral self-finding of her renaissance.

The Renaissance in India – 3

TO ATTEMPT to penetrate through the indeterminate confusion of present tendencies and first efforts in order to foresee the exact forms the new creation will take, would be an effort of very doubtful utility. One might as well try to forecast a harmony from the sounds made by the tuning of the instrument. In one direction or another we may just detect certain decisive indications, but even these are only first indications and we may be quite sure that much lies behind them that will go far beyond anything that they yet suggest. This is true whether in religion and spirituality or thought and science, poetry and art or society and politics. Everywhere there is, at most, only a beginning of beginnings.

One thing seems at any rate certain, that the spiritual motive will be in the future of India, as in her past, the real originative and dominating strain. By spirituality we do not mean a remote metaphysical mind or the tendency to dream rather than to act. That was not the great India of old in her splendid days of vigour,—whatever certain European critics or interpreters of her culture may say,—and it will not be the India of the future. Metaphysical thinking will always no doubt be a strong element in her mentality, and it is to be hoped that she will never lose her great, her sovereign powers in that direction; but Indian metaphysics are as far removed from the brilliant or the profound idea-spinning of the French or the German mind as from the broad intellectual generalising on the basis of the facts of physical science which for some time did duty for philosophy in modern Europe. It has always been in its essential parts an intellectual approach to spiritual realisation. Though in later times it led too much away from life, yet that was not its original character whether in its early Vedantic intuitional forms or in those later developments of it, such as the Gita, which belong

to the period of its most vigorous intellectual originality and creation. Buddhism itself, the philosophy which first really threw doubt on the value of life, did so only in its intellectual tendency; in its dynamic parts, by its ethical system and spiritual method, it gave a new set of values, a severe vigour, yet a gentler idealism to human living and was therefore powerfully creative both in the arts which interpret life and in society and politics. To realise intimately truth of spirit and to quicken and to remould life by it is the native tendency of the Indian mind, and to that it must always return in all its periods of health, greatness and vigour.

All great movements of life in India have begun with a new spiritual thought and usually a new religious activity. What more striking and significant fact can there be than this that even the new European influence, which was an influence intellectual, rationalistic, so often antireligious and which drew so much of its idealism from the increasingly cosmopolitan, mundane and secularist thought of the eighteenth and nineteenth centuries, precipitated in India from the very first an attempt at religious reformation and led actually to the creation of new religions? The instinct of the Indian mind was that, if a reconstruction of ideas and of society was to be attempted, it must start from a spiritual basis and take from the first a religious motive and form. The Brahmo Samaj had in its inception a large cosmopolitan idea, it was even almost eclectic in the choice of the materials for the synthesis it attempted; it combined a Vedantic first inspiration, outward forms akin to those of English Unitarianism and something of its temper, a modicum of Christian influence, a strong dose of religious rationalism and intellectualism. It is noteworthy, however, that it started from an endeavour to restate the Vedanta, and it is curiously significant of the way in which even what might be well called a protestant movement follows the curve of the national tradition and temper, that the three stages of its growth, marked by the three churches or congregations into which it split, correspond to the three eternal motives of the Indian religious mind, Jnana, Bhakti and Karma, the contemplative and philosophical, the emotional and fervently devotional and the actively and practically dynamic

spiritual mentality. The Arya Samaj in the Punjab founded itself on a fresh interpretation of the truth of the Veda and an attempt to apply old Vedic principles of life to modern conditions. The movement associated with the great names of Ramakrishna and Vivekananda has been a very wide synthesis of past religious motives and spiritual experience topped by a reaffirmation of the old asceticism and monasticism, but with new living strands in it and combined with a strong humanitarianism and zeal of missionary expansion. There has been too the movement of orthodox Hindu revivalism, more vigorous two or three decades ago than it is now. The rest of India has either felt vibrations of some of these great regional movements or been touched with smaller ones of their own making. In Bengal a strong Neo-Vaishnavic tendency is the most recent development of its religious mind and shows that the preparatory creative activity has not yet finished its workings. Throughout India the old religious sects and disciplines are becoming strongly revitalised, vocal, active, moved to a fresh self-affirmation. Islam has recently shared in the general stirring and attempts to return vitally to the original Islamic ideals or to strike out fresh developments have preceded or accompanied the awakening to life of the long torpid Mussulman mass in India.

Perhaps none of these forms, nor all the sum of them may be definitive, they may constitute only the preparatory self-finding of the Indian spiritual mind recovering its past and turning towards its future. India is the meeting-place of the religions and among these Hinduism alone is by itself a vast and complex thing, not so much a religion as a great diversified and yet subtly unified mass of spiritual thought, realisation and aspiration. What will finally come out of all this stir and ferment, lies yet in the future. There has been an introduction of fresh fruitful impulses to activity: there has been much revival of the vitality of old forms, a new study, rehabilitation, resort to old disciplines and old authorities and scriptures, — we may note that Vedanta, Veda, Purana, Yoga, and recently the same thing is being initiated with regard to the Tantra, have each in their turn been brought back into understanding, if not always yet to a perfect

understanding, to practice, to some efficacy on thought and on life; there has been an evolution of enlarging truth and novel forms out of ancient ideas and renewed experience. Whatever the last upshot may be, this spiritual and religious ferment and activity stand out as the most prominent feature of the new India; and it may be observed that while in other fields the tendency has been, until quite recently, more critical than constructive, here every impulse has been throughout powerfully creative. Especially, we see everywhere the tendency towards the return of the spirit upon life; the reassertion of a spiritual living as a foundation for a new life of the nation has been a recognisable impulse. Even asceticism and monasticism are rapidly becoming, no longer merely contemplative, self-centred or aloof, but missionary, educative, humanitarian. And recently in the utterances of the leaders of thought the insistence on life has been growing marked, self-conscious and positive. This is at present the most significant immediate sign of the future. Probably, here lies the key of the Indian renaissance, in a return from forms to the depths of a released spirituality which will show itself again in a pervading return of spirituality upon life.

But what are likely to be the great constructive ideas and the great decisive instruments which this spirituality will take to deal with and govern life, is as yet obscure, because the thought of this new India is still inchoate and indeterminative. Religions, creeds and forms are only a characteristic outward sign of the spiritual impulsion and religion itself is the intensive action by which it tries to find its inward force. Its expansive movement comes in the thought which it throws out on life, the ideals which open up new horizons and which the intellect accepts and life labours to assimilate. Philosophy in India has been the intellectual canaliser of spiritual knowledge and experience, but the philosophical intellect has not as yet decidedly begun the work of new creation; it has been rather busy with the restatement of its past gains than with any new statement which would visibly and rapidly enlarge the boundaries of its thought and aspiration. The contact of European philosophy has not been fruitful of any creative reaction; first because the

past philosophies of Europe have very little that could be of any utility in this direction, nothing of the first importance in fact which India has not already stated in forms better suited to her own spiritual temper and genius, and though the thought of Nietzsche, of Bergson and of James has recently touched more vitally just a few minds here and there, their drift is much too externally pragmatic and vitalistic to be genuinely assimilable by the Indian spirit. But, principally, a real Indian philosophy can only be evolved out of spiritual experience and as the fruit of the spiritual seeking which all the religious movements of the past century have helped to generalise. It cannot spring, as in Europe, out of the critical intellect solely or as the fruit of scientific thought and knowledge. Nor has there been very much preparing force of original critical thought in nineteenth century India. The more original intellects have either turned towards pure literature or else been busy assimilating and at most Indianising modern ideas. And though a stronger thought tendency is now beginning, all is yet uncertain flux or brilliantly vague foreshadowing.

In poetry, literature, art, science there have, on the contrary, been definite beginnings. Bengal in these, as in many other directions, has been recently the chief testing crucible or the first workshop of the Shakti of India; it is there she has chosen to cast in the greatest vivacity of new influences and develop her initial forms and inspirations. In the rest of India there is often much activity of production and one hears here and there of a solitary poet or prose-writer of genius or notable talent; but Bengal has already a considerable literature of importance, with a distinct spirit and form, well-based and always developing; she has now a great body of art original, inspired, full of delicate beauty and vision; she has not only two renowned scientists, one of the two world-famous for a central and far-reaching discovery, but a young school of research which promises to count for something in the world's science. It is here therefore that we can observe the trend of the Indian mind and the direction in which it is turning. Especially the art of the Bengal painters is very significant, more so even than the prose of Bankim or the poetry

of Tagore. Bengali poetry has had to feel its way and does not seem yet quite definitively to have found it, but Bengal art has found its way at once at the first step, by a sort of immediate intuition.

Partly this is because the new literature began in the period of foreign influence and of an indecisive groping, while art in India was quite silent,—except for the preposterous Ravi Varma interlude which was doomed to sterility by its absurdly barren incompetence,—began in a moment of self-recovery and could profit by a clearer possibility of light. But besides, plastic art is in itself by its very limitation, by the narrower and intense range of its forms and motives, often more decisively indicative than the more fluid and variable turns of literary thought and expression. Now the whole power of the Bengal artists springs from their deliberate choice of the spirit and hidden meaning in things rather than their form and surface meaning as the object to be expressed. It is intuitive and its forms are the very rhythm of its intuition, they have little to do with the metric formalities devised by the observing intellect; it leans over the finite to discover its suggestions of the infinite and inexpressible; it turns to outward life and nature to found upon it lines and colours, rhythms and embodiments which will be significant of the other life and other nature than the physical which all that is merely outward conceals. This is the eternal motive of Indian art, but applied in a new way less largely ideaed, mythological and symbolical, but with a more delicately suggestive attempt at a near, subtle, direct embodiment. This art is a true new creation, and we may expect that the artistic mind of the rest of India will follow through the gate thus opened, but we may expect it too to take on there other characteristics and find other ways of expression; for the peculiar turn and tone given by the Calcutta painters is intimate to the temperament of Bengal. But India is great by the unity of her national coupled with the rich diversity of her regional mind. That we may expect to see reflected in the resurgence of her artistic creativeness.

Poetry and literature in Bengal have gone through two distinct stages and seem to be preparing for a third of which one

cannot quite foresee the character. It began with a European and mostly an English influence, a taking in of fresh poetical and prose forms, literary ideas, artistic canons. It was a period of copious and buoyant creation which produced a number of poets and poetesses, one or two of great genius, others of a fine poetic capacity, much work of beauty and distinction, a real opening of the floodgates of Saraswati. Its work was not at all crudely imitative; the foreign influences are everywhere visible, but they are assimilated, not merely obeyed or aped. The quality of the Bengali temperament and its native aesthetic turn took hold of them and poured them into a mould of speech suitable to its own spirit. But still the substance was not quite native to the soul and therefore one feels a certain void in it. The form and expression have the peculiar grace and the delicate plastic beauty which Bengali poetical expression achieved from its beginning, but the thing expressed does not in the end amount to very much. As is inevitable when one does not think or create freely but is principally assimilating thought and form, it is thin and falls short of the greatness which we would expect from the natural power of the poet.

That period is long over, it has lived its time and its work has taken its place in the past of the literature. Two of its creators, one, the sovereign initiator of its prose expression, supreme by combination of original mentality with a flawless artistic gift, the other born into its last glow of productive brilliance, but outliving it to develop another strain and a profounder voice of poetry, released the real soul of Bengal into expression. The work of Bankim Chandra is now of the past, because it has entered already into the new mind of Bengal which it did more than any other literary influence to form; the work of Rabindranath still largely holds the present, but it has opened ways for the future which promise to go beyond it. Both show an increasing return to the Indian spirit in fresh forms; both are voices of the dawn, seek more than they find, suggest and are calling for more than they actually evoke. At present we see a fresh preparation, on one side evolving and promising to broaden out from the influence of Tagore, on the other in revolt against it and insisting on a more

distinctively national type of inspiration and creation; but what will come out of it, is not yet clear. On the whole it appears that the movement is turning in the same direction as that of the new art, though with the more flexible utterance and varied motive natural to the spoken thought and expressive word. No utterance of the highest genius, such as would give the decisive turn, has yet made itself heard. But some faint promise of a great imaginative and intuitive literature of a new Indian type is already discernible in these uncertain voices.

In the things of the mind we have then within however limited an area certain beginnings, preparatory or even initially definitive. But in the outward life of the nation we are still in a stage of much uncertainty and confusion. Very largely this is due to the political conditions which have ceased in spirit to be those of the past, but are not yet in fact those of the future. The fever and the strain born from the alternation of waves of aspiration with the reflux of non-fulfilment are not favourable to the strong formulation of a new birth in the national life. All that is as yet clear is that the first period of a superficial assimilation and aping of European political ideas and methods is over. Another political spirit has awakened in the people under the shock of the movement of the last decade which, vehemently national in its motive, proclaimed a religion of Indian patriotism, applied the notions of the ancient religion and philosophy to politics, expressed the cult of the country as mother and Shakti and attempted to base the idea of democracy firmly on the spiritual thought and impulses native to the Indian mind. Crude often and uncertain in its self-expression, organising its effort for revolt against past and present conditions but not immediately successful in carrying forward its methods of constructive development, it still effectively aroused the people and gave a definite turn to its political thought and life, the outcome of which can only appear when the nation has found completely the will and gained sufficiently the power to determine its own evolution.

Indian society is in a still more chaotic stage; for the old forms are crumbling away under the pressure of the environment, their spirit and reality are more and more passing out of

them, but the façade persists by the force of inertia of thought and will and the remaining attachment of a long association, while the new is still powerless to be born. There is much of slow and often hardly perceptible destruction, a dull preservation effective only by immobility, no possibility yet of sound reconstruction. We have had a loud proclaiming,—only where supported by religion, as in the reforming Samajes, any strong effectuation,—of a movement of social change, appealing sometimes crudely to Western exemplars and ideals, sometimes to the genius or the pattern of ancient times; but it has quite failed to carry the people, because it could not get at their spirit and itself lacked, with the exceptions noted, in robust sincerity. We have had too a revival of orthodox conservatism, more academic and sentimental than profound in its impulse or in touch with the great facts and forces of life. We have now in emergence an increasing sense of the necessity of a renovation of social ideas and expressive forms by the spirit of the nation awaking to the deeper yet unexpressed implications of its own culture, but as yet no sufficient will or means of execution. It is probable that only with the beginning of a freer national life will the powers of the renaissance take effective hold of the social mind and action of the awakened people.

The Renaissance in India – 4

THE RENAISSANCE thus determining itself, but not yet finally determined, if it is to be what the name implies, a rebirth of the soul of India into a new body of energy, a new form of its innate and ancient spirit, *prajñā purāṇī*, must insist much more finally and integrally than it has as yet done on its spiritual turn, on the greater and greater action of the spiritual motive in every sphere of our living. But here we are still liable to be met by the remnants of a misunderstanding or a refusal to understand, — it is something of both, — which was perhaps to a little extent justified by certain ascetic or religionist exaggerations, a distrust which is accentuated by a recoil from the excessive other-worldliness that has marked certain developments of the Indian mind and life, but yet is not justified, because it misses the true point at issue. Thus we are sometimes asked what on earth we mean by spirituality in art and poetry or in political and social life, — a confession of ignorance strange enough in any Indian mouth at this stage of our national history, — or how art and poetry will be any the better when they have got into them what I have recently seen described as the “twang of spirituality”, and how the practical problems either of society or of politics are going at all to profit by this element. We have here really an echo of the European idea, now of sufficiently long standing, that religion and spirituality on the one side and intellectual activity and practical life on the other are two entirely different things and have each to be pursued on its own entirely separate lines and in obedience to its own entirely separate principles. Again we may be met also by the suspicion that in holding up this ideal rule before India we are pointing her to the metaphysical and away from the dynamic and pragmatic or inculcating some obscurantist reactionary principle of mystical or irrational religiosity and diverting her from the

paths of reason and modernity which she must follow if she is to be an efficient and a well-organised nation able to survive in the shocks of the modern world. We must therefore try to make clear what it is we mean by a renaissance governed by the principle of spirituality.

But first let us say what we do not mean by this ideal. Clearly it does not signify that we shall regard earthly life as a temporal vanity, try to become all of us as soon as possible monastic ascetics, frame our social life into a preparation for the monastery or cavern or mountain-top or make of it a static life without any great progressive ideals but only some aim which has nothing to do with earth or the collective advance of the human race. That may have been for some time a tendency of the Indian mind, but it was never the whole tendency. Nor does spirituality mean the moulding of the whole type of the national being to suit the limited dogmas, forms, tenets of a particular religion, as was often enough attempted by the old societies, an idea which still persists in many minds by the power of old mental habit and association; clearly such an attempt would be impossible, even if it were desirable, in a country full of the most diverse religious opinions and harbouring too three such distinct general forms as Hinduism, Islam and Christianity, to say nothing of the numerous special forms to which each of these has given birth. Spirituality is much wider than any particular religion, and in the larger ideas of it that are now coming on us even the greatest religion becomes no more than a broad sect or branch of the one universal religion, by which we shall understand in the future man's seeking for the eternal, the divine, the greater self, the source of unity and his attempt to arrive at some equation, some increasing approximation of the values of human life with the eternal and the divine values.

Nor do we mean the exclusion of anything whatsoever from our scope, of any of the great aims of human life, any of the great problems of our modern world, any form of human activity, any general or inherent impulse or characteristic means of the desire of the soul of man for development, expansion, increasing vigour and joy, light, power, perfection. Spirit without mind,

spirit without body is not the type of man, therefore a human spirituality must not belittle the mind, life or body or hold them of small account: it will rather hold them of high account, of immense importance, precisely because they are the conditions and instruments of the life of the spirit in man. The ancient Indian culture attached quite as much value to the soundness, growth and strength of the mind, life and body as the old Hellenic or the modern scientific thought, although for a different end and a greater motive. Therefore to everything that serves and belongs to the healthy fullness of these things, it gave free play, to the activity of the reason, to science and philosophy, to the satisfaction of the aesthetic being and to all the many arts great or small, to the health and strength of the body, to the physical and economical well-being, ease, opulence of the race,—there was never a national ideal of poverty in India as some would have us believe, nor was bareness or squalor the essential setting of her spirituality,—and to its general military, political and social strength and efficiency. Their aim was high, but firm and wide too was the base they sought to establish and great the care bestowed on these first instruments. Necessarily the new India will seek the same end in new ways under the vivid impulse of fresh and large ideas and by an instrumentality suited to more complex conditions; but the scope of her effort and action and the suppleness and variety of her mind will not be less, but greater than of old. Spirituality is not necessarily exclusive; it can be and in its fullness must be all-inclusive.

But still there is a great difference between the spiritual and the purely material and mental view of existence. The spiritual view holds that the mind, life, body are man's means and not his aims and even that they are not his last and highest means; it sees them as his outer instrumental self and not his whole being. It sees the infinite behind all things finite and it adjudges the value of the finite by higher infinite values of which they are the imperfect translation and towards which, to a truer expression of them, they are always trying to arrive. It sees a greater reality than the apparent not only behind man and the world, but within man and the world, and this soul, self, divine thing in man it

holds to be that in him which is of the highest importance, that which everything else in him must try in whatever way to bring out and express, and this soul, self, divine presence in the world it holds to be that which man has ever to try to see and recognise through all appearances, to unite his thought and life with it and in it to find his unity with his fellows. This alters necessarily our whole normal view of things; even in preserving all the aims of human life, it will give them a different sense and direction.

We aim at the health and vigour of the body; but with what object? For its own sake, will be the ordinary reply, because it is worth having; or else that we may have long life and a sound basis for our intellectual, vital, emotional satisfactions. Yes, for its own sake, in a way, but in this sense that the physical too is an expression of the spirit and its perfection is worth having, is part of the dharma of the complete human living; but still more as a basis for all that higher activity which ends in the discovery and expression of the divine self in man. *Sarīram khalu dharmasādhanam*, runs the old Sanskrit saying, the body too is our means for fulfilling the dharma, the Godward law of our being. The mental, the emotional, the aesthetic parts of us have to be developed, is the ordinary view, so that they may have a greater satisfaction, or because that is man's finer nature, because so he feels himself more alive and fulfilled. This, but not this only; rather because these things too are the expressions of the spirit, things which are seeking in him for their divine values and by their growth, subtlety, flexibility, power, intensity he is able to come nearer to the divine Reality in the world, to lay hold on it variously, to tune eventually his whole life into unity and conformity with it. Morality is in the ordinary view a well-regulated individual and social conduct which keeps society going and leads towards a better, a more rational, temperate, sympathetic, self-restrained dealing with our fellows. But ethics in the spiritual point of view is much more, it is a means of developing in our action and still more essentially in the character of our being the diviner self in us, a step of our growing into the nature of the Godhead.

So with all our aims and activities; spirituality takes them

all and gives them a greater, diviner, more intimate sense. Philosophy is in the Western way of dealing with it a dispassionate enquiry by the light of the reason into the first truths of existence, which we shall get at either by observing the facts science places at our disposal or by a careful dialectical scrutiny of the concepts of the reason or a mixture of the two methods. But from the spiritual view-point truth of existence is to be found by intuition and inner experience and not only by the reason and by scientific observation; the work of philosophy is to arrange the data given by the various means of knowledge, excluding none, and put them into their synthetic relation to the one Truth, the one supreme and universal reality. Eventually, its real value is to prepare a basis for spiritual realisation and the growing of the human being into his divine self and divine nature. Science itself becomes only a knowledge of the world which throws an added light on the spirit of the universe and his way in things. Nor will it confine itself to a physical knowledge and its practical fruits or to the knowledge of life and man and mind based upon the idea of matter or material energy as our starting-point; a spiritualised culture will make room for new fields of research, for new and old psychical sciences and results which start from spirit as the first truth and from the power of mind and of what is greater than mind to act upon life and matter. The primitive aim of art and poetry is to create images of man and Nature which shall satisfy the sense of beauty and embody artistically the ideas of the intelligence about life and the responses of the imagination to it; but in a spiritual culture they become too in their aim a revelation of greater things concealed in man and Nature and of the deepest spiritual and universal beauty. Politics, society, economy are in the first form of human life simply an arrangement by which men collectively can live, produce, satisfy their desires, enjoy, progress in bodily, vital and mental efficiency; but the spiritual aim makes them much more than this, first, a framework of life within which man can seek for and grow into his real self and divinity, secondly, an increasing embodiment of the divine law of being in life, thirdly, a collective advance towards the light, power, peace, unity, harmony of the diviner

nature of humanity which the race is trying to evolve. This and nothing more but nothing less, this in all its potentialities, is what we mean by a spiritual culture and the application of spirituality to life.

Those who distrust this ideal or who cannot understand it, are still under the sway of the European conception of life which for a time threatened to swamp entirely the Indian spirit. But let us remember that Europe itself is labouring to outgrow the limitations of its own conceptions and precisely by a rapid infusion of the ideas of the East,—naturally, essential ideas and not the mere forms,—which have been first infiltrating and are now more freely streaming into Western thought, poetry, art, ideas of life, not to overturn its culture, but to transform, enlighten and aggrandise its best values and to add new elements which have too long been ignored or forgotten. It will be singular if while Europe is thus intelligently enlarging herself in the new light she has been able to seize and admitting the truths of the spirit and the aim at a divine change in man and his life, we in India are to take up the cast-off clothes of European thought and life and to straggle along in the old rut of her wheels, always taking up today what she had cast off yesterday. We should not allow our cultural independence to be paralysed by the accident that at the moment Europe came in upon us, we were in a state of ebb and weakness, such as comes some day upon all civilisations. That no more proves that our spirituality, our culture, our leading ideas were entirely mistaken and the best we can do is vigorously to Europeanise, rationalise, materialise ourselves in the practical parts of life,—keeping perhaps some spirituality, religion, Indianism as a graceful decoration in the background,—than the great catastrophe of the war proves that Europe's science, her democracy, her progress were all wrong and she should return to the Middle Ages or imitate the culture of China or Turkey or Tibet. Such generalisations are the facile falsehoods of a hasty and unreflecting ignorance.

We have both made mistakes, faltered in the true application of our ideals, been misled into unhealthy exaggerations. Europe has understood the lesson, she is striving to correct herself;

but she does not for this reason forswear science, democracy, progress, but purposes to complete and perfect them, to use them better, to give them a sounder direction. She is admitting the light of the East, but on the basis of her own way of thinking and living, opening herself to truth of the spirit, but not abandoning her own truth of life and science and social ideals. We should be as faithful, as free in our dealings with the Indian spirit and modern influences; correct what went wrong with us; apply our spirituality on broader and freer lines, be if possible not less but more spiritual than were our forefathers; admit Western science, reason, progressiveness, the essential modern ideas, but on the basis of our own way of life and assimilated to our spiritual aim and ideal; open ourselves to the throb of life, the pragmatic activity, the great modern endeavour, but not therefore abandon our fundamental view of God and man and Nature. There is no real quarrel between them; for rather these two things need each other to fill themselves in, to discover all their own implications, to awaken to their own richest and completest significances.

India can best develop herself and serve humanity by being herself and following the law of her own nature. This does not mean, as some narrowly and blindly suppose, the rejection of everything new that comes to us in the stream of Time or happens to have been first developed or powerfully expressed by the West. Such an attitude would be intellectually absurd, physically impossible, and above all unspiritual; true spirituality rejects no new light, no added means or materials of our human self-development. It means simply to keep our centre, our essential way of being, our inborn nature and assimilate to it all we receive, and evolve out of it all we do and create. Religion has been a central preoccupation of the Indian mind; some have told us that too much religion ruined India, precisely because we made the whole of life religion or religion the whole of life, we have failed in life and gone under. I will not answer, adopting the language used by the poet in a slightly different connection, that our fall does not matter and that the dust in which India lies is sacred. The fall, the failure does matter, and to lie in the dust is no sound position for man or nation. But the reason assigned

is not the true one. If the majority of Indians had indeed made the whole of their lives religion in the true sense of the word, we should not be where we are now; it was because their public life became most irreligious, egoistic, self-seeking, materialistic that they fell. It is possible, that on one side we deviated too much into an excessive religiosity, that is to say, an excessive externalism of ceremony, rule, routine, mechanical worship, on the other into a too world-shunning asceticism which drew away the best minds who were thus lost to society instead of standing like the ancient Rishis as its spiritual support and its illuminating life-givers. But the root of the matter was the dwindling of the spiritual impulse in its generality and broadness, the decline of intellectual activity and freedom, the waning of great ideals, the loss of the gust of life.

Perhaps there was too much of religion in one sense; the word is English, smacks too much of things external such as creeds, rites, an external piety; there is no one Indian equivalent. But if we give rather to religion the sense of the following of the spiritual impulse in its fullness and define spirituality as the attempt to know and live in the highest self, the divine, the all-embracing unity and to raise life in all its parts to the divinest possible values, then it is evident that there was not too much of religion, but rather too little of it—and in what there was, a too one-sided and therefore an insufficiently ample tendency. The right remedy is, not to belittle still farther the agelong ideal of India, but to return to its old amplitude and give it a still wider scope, to make in very truth all the life of the nation a religion in this high spiritual sense. This is the direction in which the philosophy, poetry, art of the West is, still more or less obscurely, but with an increasing light, beginning to turn, and even some faint glints of the truth are beginning now to fall across political and sociological ideals. India has the key to the knowledge and conscious application of the ideal; what was dark to her before in its application, she can now, with a new light, illumine; what was wrong and wry in her old methods she can now rectify; the fences which she created to protect the outer growth of the spiritual ideal and which afterwards became

barriers to its expansion and farther application, she can now break down and give her spirit a freer field and an ampler flight: she can, if she will, give a new and decisive turn to the problems over which all mankind is labouring and stumbling, for the clue to their solutions is there in her ancient knowledge. Whether she will rise or not to the height of her opportunity in the renaissance which is coming upon her, is the question of her destiny.

Indian Culture
and
External Influence

Indian Culture and External Influence

IN CONSIDERING Indian civilisation and its renascence, I suggested that a powerful new creation in all fields was our great need, the meaning of the renascence and the one way of preserving the civilisation. Confronted with the huge rush of modern life and thought, invaded by another dominant civilisation almost her opposite or inspired at least with a very different spirit to her own, India can only survive by confronting this raw, new, aggressive, powerful world with fresh diviner creations of her own spirit, cast in the mould of her own spiritual ideals. She must meet it by solving its greater problems,—which she cannot avoid, even if such avoidance could be thought desirable,—in her own way, through solutions arising out of her own being and from her own deepest and largest knowledge. In that connection I spoke of the acceptance and assimilation from the West of whatever in its knowledge, ideas, powers was assimilable, compatible with her spirit, reconcilable with her ideals, valuable for a new statement of life. This question of external influence and new creation from within is of very considerable importance; it calls for more than a passing mention. Especially it is necessary to form some more precise idea of what we mean by acceptance and of the actual effect of assimilation; for this is a problem of pressing incidence in which we have to get our ideas clear and fix firmly and seemingly on our line of solution.

But it is possible to hold that while new creation—and not a motionless sticking to old forms—is our one way of life and salvation, no acceptance of anything Western is called for, we can find in ourselves all that we need; no considerable acceptance is possible without creating a breach which will bring pouring in the rest of the occidental deluge. That, if I have not misread it, is the sense of a comment on these articles in a

Bengali literary periodical¹ which holds up the ideal of a new creation to arise from within entirely on national lines and in the national spirit. The writer takes his stand on a position which is common ground, that humanity is one, but different peoples are variant soul-forms of the common humanity. When we find the oneness, the principle of variation is not destroyed but finds rather its justification; it is not by abolishing ourselves, our own special temperament and power, that we can get at the living oneness, but by following it out and raising it to its highest possibilities of freedom and action. That is a truth which I have myself insisted on repeatedly, with regard to the modern idea and attempt at some kind of political unification of humanity, as a very important part of the psychological sense of social development, and again in this question of a particular people's life and culture in all its parts and manifestations. I have insisted that uniformity is not a real but a dead unity: uniformity kills life while real unity, if well founded, becomes vigorous and fruitful by a rich energy of variation. But the writer adds that the idea of taking over what is best in occidental civilisation, is a false notion without a living meaning; to leave the bad and take the good sounds very well, but this bad and this good are not separable in that way: they are the inextricably mingled growth of one being, not separate blocks of a child's toy house set side by side and easily detachable, — and what is meant then by cutting out and taking one element and leaving the rest? If we take over a Western ideal, we take it over from a living form which strikes us; we imitate that form, are subjugated by its spirit and natural tendencies, and the good and bad intertwined in the living growth come in upon us together and take united possession. In fact, we have been for a long time so imitating the West, trying to become like it or partly like it and have fortunately failed, for that would have meant creating a bastard or twy-natured culture; but twy-natured, as Tennyson makes his Lucretius say, is no-natured and a bastard culture is no sound, truth-living

¹ *Narayan*, edited by Mr. C. R. Das.

culture. An entire return upon ourselves is our only way of salvation.

There is much to be said here, it seems to me, both in the way of confirmation and of modification. But let us be clear about the meaning of our terms. That the attempt in the last century which still in some directions continues,—to imitate European civilisation and to make ourselves a sort of brown Englishmen, to throw our ancient culture into the dust-bin and put on the livery or uniform of the West was a mistaken and illegitimate endeavour, I heartily agree. At the same time a certain amount of imitation, a great amount even, was, one might almost say, a biological necessity, at any rate a psychological necessity of the situation. Not only when a lesser meets a greater culture, but when a culture which has fallen into a state of comparative inactivity, sleep, contraction, is faced with, still more when it receives the direct shock of a waking, active, tremendously creative civilisation, finds thrown upon it novel and successful powers and functionings, sees an immense succession and development of new ideas and formations, it is impelled by the very instinct of life to take over these ideas and forms, to annex, to enrich itself, even to imitate and reproduce, and in one way or in another take large account and advantage of these new forces and opportunities. That is a phenomenon which has happened repeatedly in history, in a greater or a lesser degree, in part or in totality. But if there is only a mechanical imitation, if there is a subordination and servitude, the inactive or weaker culture perishes, it is swallowed up by the invading leviathan. And even short of that, in proportion as there is a leaning towards these undesirable things, it languishes, is unsuccessful in its attempt at annexation, loses besides the power of its own spirit. To recover its own centre, find its own base and do whatever it has to do in its own strength and genius is certainly the one way of salvation. But even then a certain amount of acceptance, of forms too,—some imitation, if all taking over of forms must be called imitation,—is inevitable. We have, for instance, taken over in literature the form of the novel, the short story, the critical essay among a number of other adoptions, in science not only the

discoveries and inventions, but the method and instrumentation of inductive research, in politics the press, the platform, the forms and habits of agitation, the public association. I do not suppose that anyone seriously thinks of renouncing or exiling these modern additions to our life,—though they are not all of them by any means unmixed blessings,—on the ground that they are foreign importations. But the question is what we do with them and whether we can bring them to be instruments and by some characteristic modification moulds of our own spirit. If so, there has been an acceptance and an assimilation; if not there has been merely a helpless imitation.

But the taking over of forms is not the heart of the question. When I speak of acceptance and assimilation, I am thinking of certain influences, ideas, energies brought forward with a great living force by Europe, which can awaken and enrich our own cultural activities and cultural being if we succeed in dealing with them with a victorious power and originality, if we can bring them into our characteristic way of being and transform them by its shaping action. That was in fact what our own ancestors did, never losing their originality, never effacing their uniqueness, because always vigorously creating from within, with whatever knowledge or artistic suggestion from outside they thought worthy of acceptance or capable of an Indian treatment. But I would certainly repel the formula of taking the good and leaving the bad as a crudity, one of those facile formulas which catch the superficial mind but are unsound in conception. Obviously, if we “take over” anything, the good and the bad in it will come in together pell-mell. If we take over for instance that terrible, monstrous and compelling thing, that giant Asuric creation, European industrialism,—unfortunately we are being forced by circumstances to do it,—whether we take it in its form or its principle, we may under more favourable conditions develop by it our wealth and economic resources, but assuredly we shall get too its social discords and moral plagues and cruel problems, and I do not see how we shall avoid becoming the slaves of the economic aim in life and losing the spiritual principle of our culture.

But, besides, these terms good and bad in this connection mean nothing definite, give us no help. If I must use them, where they can have only a relative significance, in a matter not of ethics, but of an interchange between life and life, I must first give them this general significance that whatever helps me to find myself more intimately, nobly, with a greater and sounder possibility of self-expressive creation, is good; whatever carries me out of my orientation, whatever weakens and belittles my power, richness, breadth and height of self-being, is bad for me. If the distinction is so understood, it will be evident, I think, to any serious and critical mind which tries to fathom things, that the real point is not the taking over of this or that formal detail, which has only a sign value, for example, widow remarriage, but a dealing with great effective ideas, such as are the ideas, in the external field of life, of social and political liberty, equality, democracy. If I accept any of these ideas it is not because they are modern or European, which is in itself no recommendation, but because they are human, because they present fruitful view-points to the spirit, because they are things of the greatest importance in the future development of the life of man. What I mean by acceptance of the effective idea of democracy,—the thing itself, never fully worked out, was present as an element in ancient Indian as in ancient European polity and society,—is that I find its inclusion in our future way of living, in some shape, to be a necessity of our growth. What I mean by assimilation, is that we must not take it crudely in the European forms, but must go back to whatever corresponds to it, illuminates its sense, justifies its highest purport in our own spiritual conception of life and existence, and in that light work out its extent, degree, form, relation to other ideas, application. To everything I would apply the same principle, to each in its own kind, after its proper dharma, in its right measure of importance, its spiritual, intellectual, ethical, aesthetic, dynamic utility.

I take it as a self-evident law of individual being applicable to group-individuality, that it is neither desirable nor possible to exclude everything that comes in to us from outside. I take it as an equally self-evident law that a living organism, which

grows not by accretion, but by self-development and assimilation, must recast the things it takes in to suit the law and form and characteristic action of its biological or psychological body, reject what would be deleterious or poisonous to it,— and what is that but the non-assimilable? — take only what can be turned into useful stuff of self-expression. It is, to use an apt Sanskritic phrase employed in the Bengali tongue, *ātmasāt-karana*, an assimilative appropriation, a making the thing settle into oneself and turn into characteristic form of our self-being. The impossibility of entire rejection arises from the very fact of our being a term of diversity in a unity, not really separate from all other existence, but in relation with all that surrounds us, because in life this relation expresses itself very largely by a process of interchange. The undesirability of total rejection, even if it were entirely possible, arises from the fact that interchange with the environment is necessary to a healthy persistence and growth; the living organism which rejects all such interchange, would speedily languish and die of lethargy and inanition.

Mentally, vitally and physically I do not grow by a pure self-development from within in a virgin isolation; I am not a separate self-existent being proceeding from a past to a new becoming in a world of its own where no one is but itself, nothing works but its own inner powers and musings. There is in every individualised existence a double action, a self-development from within which is its greatest intimate power of being and by which it is itself, and a reception of impacts from outside which it has to accommodate to its own individuality and make into material of self-growth and self-power. The two operations are not mutually exclusive, nor is the second harmful to the first except when the inner genius is too weak to deal victoriously with its environmental world; on the contrary the reception of impacts stimulates in a vigorous and healthy being its force for self-development and is an aid to a greater and more pronouncedly characteristic self-determination. As we rise in the scale we find that the power of original development from within, of conscious self-determination increases more and more, while in those who live most powerfully in themselves it reaches striking,

sometimes almost divine proportions. But at the same time we see that the allied power of seizing upon the impacts and suggestions of the outside world grows in proportion; those who live most powerfully in themselves, can also most largely use the world and all its material for the Self,— and, it must be added, most successfully help the world and enrich it out of their own being. The man who most finds and lives from the inner self, can most embrace the universal and become one with it; the Swarat, independent, self-possessed and self-ruler, can most be the Samrat, possessor and shaper of the world in which he lives, can most too grow one with all in the Atman. That is the truth this developing existence teaches us, and it is one of the greatest secrets of the old Indian spiritual knowledge.

Therefore to live in one's self, determining one's self-expression from one's own centre of being in accordance with one's own law of being, swadharma, is the first necessity. Not to be able to do that means disintegration of the life; not to do it sufficiently means languor, weakness, inefficiency, the danger of being oppressed by the environing forces and overborne; not to be able to do it wisely, intuitively, with a strong use of one's inner material and inner powers, means confusion, disorder and finally decline and loss of vitality. But also not to be able to use the material that the life around offers us, not to lay hold on it with an intuitive selection and a strong mastering assimilation is a serious deficiency and a danger to the existence. To a healthy individuality the external impact or entering energy, idea, influence may act as an irritant awakening the inner being to a sense of discord, incompatibility or peril, and then there is a struggle, an impulse and process of rejection; but even in this struggle, in this process of rejection there is some resultant of change and growth, some increment of the power and material of life; the energies of the being are stimulated and helped by the attack. It may act as a stimulus, awakening a new action of the self-consciousness and a sense of fresh possibility,— by comparison, by suggestion, by knocking at locked doors and arousing slumbering energies. It may come in as a possible material which has then to be reshaped to a form of the inner energy,

harmonised with the inner being, reinterpreted in the light of its own characteristic self-consciousness. In a great change of environment or a close meeting with a mass of invading influences all these processes work together and there is possibly much temporary perplexity and difficulty, many doubtful and perilous movements, but also the opportunity of a great self-developing transformation or an immense and vigorous renascence.

The group-soul differs from the individual only in being more self-sufficient by reason of its being an assemblage of many individual selves and capable within of many group variations. There is a constant inner interchange which may for a long time suffice to maintain the vitality, growth, power of developing activity, even when there is a restricted interchange with the rest of humanity. Greek civilisation,— after growing under the influence of Egyptian, Phoenician and other oriental influences,— separated itself sharply from the non-Hellenic “barbarian” cultures and was able for some centuries to live within itself by a rich variation and internal interchange. There was the same phenomenon in ancient India of a culture living intensely from within in a profound differentiation from all surrounding cultures, its vitality rendered possible by an even greater richness of internal interchange and variation. Chinese civilisation offers a third instance. But at no time did Indian culture exclude altogether external influences; on the contrary a very great power of selective assimilation, subordination and transformation of external elements was a characteristic of its processes; it protected itself from any considerable or overwhelming invasion, but laid hands on and included whatever struck or impressed it and in the act of inclusion subjected it to a characteristic change which harmonised the new element with the spirit of its own culture. But nowadays any such strong separative aloofness as distinguished the ancient civilisations, is no longer possible; the races of mankind have come too close to each other, are being thrown together in a certain unavoidable life unity. We are confronted with the more difficult problem of living in the full stress of this greater interaction and imposing on its impacts the law of our being.

Any attempt to remain exactly what we were before the European invasion or to ignore in future the claims of a modern environment and necessity is foredoomed to an obvious failure. However much we may deplore some of the characteristics of that intervening period in which we were dominated by the Western standpoint or move away from the standpoint back to our own characteristic way of seeing existence, we cannot get rid of a certain element of inevitable change it has produced upon us, any more than a man can go back in life to what he was some years ago and recover entire and unaffected a past mentality. Time and its influences have not only passed over him, but carried him forward in their stream. We cannot go backward to a past form of our being, but we can go forward to a large repossession of ourselves in which we shall make a better, more living, more real, more self-possessed use of the intervening experience. We can still think in the essential sense of the great spirit and ideals of our past, but the form of our thinking, our speaking, our development of them has changed by the very fact of new thought and experience; we see them not only in the old, but in new lights, we support them by the added strength of new view-points, even the old words we use acquire for us a modified, more extended and richer significance. Again, we cannot be "ourselves alone" in any narrow formal sense, because we must necessarily take account of the modern world around us and get full knowledge of it, otherwise we cannot live. But all such taking account of things, all added knowledge modifies our subjective being. My mind, with all that depends on it, is modified by what it observes and works upon, modified when it takes in from it fresh materials of thought, modified when it is wakened by its stimulus to new activities, modified even when it denies and rejects; for even an old thought or truth which I affirm against an opposing idea, becomes a new thought to me in the effort of affirmation and rejection, clothes itself with new aspects and issues. My life is modified in the same way by the life influences it has to encounter and confront. Finally, we cannot avoid dealing with the great governing ideas and problems of the modern world. The modern world is still

mainly European, a world dominated by the European mind and Western civilisation. We claim to set right this undue preponderance, to reassert the Asiatic and, for ourselves, the Indian mind and to preserve and develop the great values of Asiatic and of Indian civilisation. But the Asiatic or the Indian mind can only assert itself successfully by meeting these problems and by giving them a solution which will justify its own ideals and spirit.

The principle I have affirmed results both from the necessity of our nature and the necessity of things, of life,—fidelity to our own spirit, nature, ideals, the creation of our own characteristic forms in the new age and the new environment, but also a strong and masterful dealing with external influences which need not be and in the nature of the situation cannot be a total rejection; therefore there must be an element of successful assimilation. There remains the very difficult question of the application of the principle,—the degree, the way, the guiding perceptions. To think that out we must look at each province of culture and, keeping always firm hold on a perception of what the Indian spirit is and the Indian ideal is, see how they can work upon the present situation and possibilities in each of these provinces and lead to a new victorious creation. In such thinking it will not do to be too dogmatic. Each capable Indian mind must think it out or, better, work it out in its own light and power,—as the Bengal artists are working it out in their own sphere,—and contribute some illumination or effectuation. The spirit of the Indian renascence will take care of the rest, that power of the universal Time-Spirit which has begun to move in our midst for the creation of a new and greater India.

“Is India Civilised?”

“Is India Civilised?”

A BOOK under this rather startling title was published some years ago by Sir John Woodroffe, the well-known scholar and writer on Tantric philosophy, in answer to an extravagant *jeu d'esprit* by Mr. William Archer. That well-known dramatic critic leaving his safe natural sphere for fields in which his chief claim to speak was a sublime and confident ignorance, assailed the whole life and culture of India and even lumped together all her greatest achievements, philosophy, religion, poetry, painting, sculpture, Upanishads, Mahabharata, Ramayana in one wholesale condemnation as a repulsive mass of unspeakable barbarism. It was argued by many at the time that to reply to a critic of this kind was to break a butterfly, or it might be in this instance a bumble-bee upon the wheel. But Sir John Woodroffe insisted that even an attack of this ignorant kind ought not to be neglected; he took it as a particularly useful type in the general kind, first, because it raised the question from the rationalistic and not from the Christian and missionary standpoint and, again, because it betrayed the grosser underlying motives of all such attacks. But his book was important, not so much as an answer to a particular critic, but because it raised with great point and power the whole question of the survival of Indian civilisation and the inevitability of a war of cultures.

The question whether there has been or is a civilisation in India is not any longer debatable; for everyone whose opinion counts recognises the presence of a distinct and a great civilisation unique in its character. Sir John Woodroffe's purpose was to disclose the conflict of European and Asiatic culture and, in greater prominence, the distinct meaning and value of Indian civilisation, the peril it now runs and the calamity its destruction would be to the world. The author held its preservation to be of an immense importance to mankind and he believed it to

be in great danger. In the stupendous rush of change which is coming on the human world as a result of the present tornado of upheaval, ancient India's culture, attacked by European modernism, overpowered in the material field, betrayed by the indifference of her children, may perish for ever along with the soul of the nation that holds it in its keeping. The book was an urgent invitation to us to appreciate better this sacred trust and the near peril which besets it and to stand firm and faithful in the hour of the ordeal. It will be useful to state briefly its gist as an introduction to this all-important issue.

A true happiness in this world is the right terrestrial aim of man, and true happiness lies in the finding and maintenance of a natural harmony of spirit, mind and body. A culture is to be valued to the extent to which it has discovered the right key of this harmony and organised its expressive motives and movements. And a civilisation must be judged by the manner in which all its principles, ideas, forms, ways of living work to bring that harmony out, manage its rhythmic play and secure its continuance or the development of its motives. A civilisation in pursuit of this aim may be predominantly material like modern European culture, predominantly mental and intellectual like the old Graeco-Roman or predominantly spiritual like the still persistent culture of India. India's central conception is that of the Eternal, the Spirit here incased in matter, involved and immanent in it and evolving on the material plane by rebirth of the individual up the scale of being till in mental man it enters the world of ideas and realm of conscious morality, *dharma*. This achievement, this victory over unconscious matter develops its lines, enlarges its scope, elevates its levels until the increasing manifestation of the sattvic or spiritual portion of the vehicle of mind enables the individual mental being in man to identify himself with the pure spiritual consciousness beyond Mind. India's social system is built upon this conception; her philosophy formulates it; her religion is an aspiration to the spiritual consciousness and its fruits; her art and literature have the same upward look; her whole dharma or law of being is founded upon it. Progress she admits, but this spiritual progress, not the

externally self-unfolding process of an always more and more prosperous and efficient material civilisation. It is her founding of life upon this exalted conception and her urge towards the spiritual and the eternal that constitute the distinct value of her civilisation. And it is her fidelity, with whatever human shortcomings, to this highest ideal that has made her people a nation apart in the human world.

But there are other cultures led by a different conception and even an opposite motive. And by the law of struggle which is the first law of existence in the material universe, varying cultures are bound to come into conflict. A deep-seated urge in Nature compels them to attempt to extend themselves and to destroy, assimilate and replace all disparities or opposites. Conflict is not indeed the last and ideal stage; for that comes when various cultures develop freely, without hatred, misunderstanding or aggression and even with an underlying sense of unity, their separate special motives. But so long as the principle of struggle prevails, one must face the lesser law; it is fatal to disarm in the midmost of the battle. The culture which gives up its living separateness, the civilisation which neglects an active self-defence will be swallowed up and the nation which lived by it will lose its soul and perish. Each nation is a Shakti or power of the evolving spirit in humanity and lives by the principle which it embodies. India is the Bharata Shakti, the living energy of a great spiritual conception, and fidelity to it is the very principle of her existence. For by its virtue alone she has been one of the immortal nations; this alone has been the secret of her amazing persistence and perpetual force of survival and revival.

The principle of struggle has assumed the large historical aspect of an agelong clash and pressure of conflict between Asia and Europe. This clash, this mutual pressure has had its material side, but has borne also its cultural and spiritual aspect. Both materially and spiritually Europe has thrown herself repeatedly upon Asia, Asia too upon Europe, to conquer, assimilate and dominate. There has been a constant alternation, a flowing backward and forward of these two seas of power. All Asia has always had the spiritual tendency in more or less intensity,

with more or less clearness; but in this essential matter India is the quintessence of the Asiatic way of being. Europe too in mediaeval times had a culture in which by the dominance of the Christian idea—but Christianity was of Asiatic origin—the spiritual motive took the lead; then there was an essential similarity as well as a certain difference. Still the differentiation of cultural temperament has on the whole been constant. Since some centuries Europe has become material, predatory, aggressive, and has lost the harmony of the inner and outer man which is the true meaning of civilisation and the efficient condition of a true progress. Material comfort, material progress, material efficiency have become the gods of her worship. The modern European civilisation which has invaded Asia and which all violent attacks on Indian ideals represent, is the effective form of this materialistic culture. India, true to her spiritual motive, has never shared in the physical attacks of Asia upon Europe; her method has always been an infiltration of the world with her ideas, such as we today see again in progress. But she has now been physically occupied by Europe and this physical conquest must necessarily be associated with an attempt at cultural conquest; that invasion too has also made some progress. On the other hand English rule has enabled India still to retain her identity and social type; it has awakened her to herself and has meanwhile, until she became conscious of her strength, guarded her against the flood which would otherwise have submerged and broken her civilisation.¹ It is for her now to recover herself, defend her cultural existence against the alien penetration, preserve her distinct spirit, essential principle and characteristic forms for her own salvation and the total welfare of the human race.

But many questions may arise,—and principally whether

¹ This contention cannot be accepted in an unqualified sense. English rule has by its general principle of social and religious non-interference prevented any direct and violent touch, any deliberate and purposeful social pressure; but it has undermined and deprived of living strength all the preexisting centres and instruments of Indian social life and by a sort of unperceived rodent process left it only a rotting shell without expansive power or any better defensive force than the force of inertia.

such a spirit of defence and attack is the right spirit, whether union, harmony, interchange are not our proper temperament for the coming human advance. Is not a unified world-culture the large way of the future? Can either an exaggeratedly spiritual or an excessively temporal civilisation be the sound condition of human progress or human perfection? A happy or just reconciliation would seem to be a better key to a harmony of Spirit, Mind and Body. And there is the question too whether the forms of Indian culture must be preserved intact as well as the spirit. To these queries the reply of the author is to be found in his law of graduality of the spiritual advance of humanity, its need of advancing through three successive stages.

The first stage is the period of conflict and competition which has been ever dominant in the past and still overshadows the present of mankind. For even when the crudest forms of material conflict are mitigated, the conflict itself still survives and the cultural struggle comes into greater prominence. The second step brings the stage of concert. The third and last is marked by the spirit of sacrifice in which, because all is known as the one Self, each gives himself for the good of others. The second stage has hardly at all commenced for most; the third belongs to the indeterminate future. Individuals have reached the highest stage; the perfected Sannyasin, the liberated man, the soul that has become one with the Spirit, knows all being as himself and for him all self-defence and attack are needless. For strife does not belong to the law of his seeing; sacrifice and self-giving are the whole principle of his action. But no people has reached that level, and to follow a law or principle involuntarily or ignorantly or contrary to the truth of one's consciousness is a falsehood and a self-destruction. To allow oneself to be killed, like the lamb attacked by the wolf, brings no growth, farthers no development, assures no spiritual merit. Concert or unity may come in good time, but it must be an underlying unity with a free differentiation, not a swallowing up of one by another or an incongruous and inharmonious mixture. Nor can it come before the world is ready for these greater things. To lay down one's arms in a state of war is to invite destruction and it can serve no

compensating spiritual purpose.

Spiritual and temporal have indeed to be perfectly harmonised, for the spirit works through mind and body. But the purely intellectual or heavily material culture of the kind that Europe now favours, bears in its heart the seed of death; for the living aim of culture is the realisation on earth of the kingdom of heaven. India, though its urge is towards the Eternal, since that is always the highest, the entirely real, still contains in her own culture and her own philosophy a supreme reconciliation of the eternal and the temporal and she need not seek it from outside. On the same principle the form of the interdependence of mind, body and spirit in a harmonious culture is important as well as the pure spirit; for the form is the rhythm of the spirit. It follows that to break up the form is to injure the spirit's self-expression or at least to put it into grave peril. Change of forms there may and will be, but the novel formation must be a new self-expression or self-creation developed from within; it must be characteristic of the spirit and not servilely borrowed from the embodiments of an alien nature.

Where then does India actually stand in this critical hour of her necessity and how far can she be said to be still firmly seated on her eternal foundations? Already she has been largely affected by European culture and the peril is far from over; on the contrary it will be greater, more insistent, more imperatively violent in the immediate future. Asia is rearising; but that very fact will intensify and is already intensifying the attempt, natural and legitimate according to the law of competition, of European civilisation to assimilate Asia. For if she is culturally transformed and conquered, then when she again counts in the material order of the world, it will not be with any menace of the invasion of Europe by the Asiatic ideal. It is a cultural quarrel complicated with a political question. Asia must become culturally a province of Europe and form politically one part of a Europeanised if not a European concert; otherwise Europe may become culturally a province of Asia, Asiaticised by the dominant influence of wealthy, enormous, powerful Asiatic peoples in the new world-system. The motive of Mr. Archer's attack is frankly a political

motive. This is the burden of all his song that the reconstruction of the world must take place in the forms and follow the canons of a rationalistic and materialistic European civilisation. On his reasoning, India if she adheres to her own civilisation, if she cherishes its spiritual motive, if she clings to its spiritual principle of formation, will stand out as a living denial, a hideous "blot" upon this fair, luminous, rationalistic world. Either she must Europeanise, rationalise, materialise her whole being and deserve liberty by the change or else she must be kept in subjection and administered by her cultural superiors: her people of three hundred million religious savages must be held down firmly, taught and civilised by her noble and enlightened Christian-atheistic European warders and tutors. A grotesque statement in form, but in substance it has in it the root of the matter. As against the attack — not universal, for understanding and appreciation of Indian culture are now more common than before, — India is indeed awaking and defending herself, but not sufficiently and not with the whole-heartedness, the clear sight and the firm resolution which can alone save her from the peril. Today it is close; let her choose, — for the choice is imperatively before her, to live or to perish.

The warning cannot be neglected; recent utterances of European publicists and statesmen, recent books and writings against India and the joyful and enthusiastic welcome they have received from the public of occidental countries, point to the reality of the danger. It arises indeed as a necessity from the present political situation and cultural trend of humanity at this moment of enormous decisive change. It is not necessary to follow the writer in all the viewpoints expressed in his book. I cannot myself accept in full his eulogy of the mediaeval civilisation of Europe. Its interest, the beauty of its artistic motives, its deep and sincere spiritual urgings are marred for me by its large strain of ignorance and obscurantism, its cruel intolerance, its revolting early-Teutonic hardness, brutality, ferocity and coarseness. He seems to me to hit a little too hard at the later European culture. This predominantly economic type of civilisation has been ugly enough in its strain of utilitarian materialism, which we shall

err grossly if we imitate; still it has been uplifted by some nobler ideals that have done much for the race. But even these are crude and imperfect in their form and need to be spiritualised in their meaning before they can be wholly admitted by the mind of India. I think too that the author has a little underrated the force of the Indian revival. I do not mean its outward realised strength, for that is very deficient, but the inevitability of its drive, its spiritual and potential force. And he has made a little too much of the servile type of Indian who is capable of mouthing the portentously obsequious imagination that "European institutions are the standard by which the aspirations of India are set." That, except for the rapidly dwindling class to which this spokesman belongs, has its truth now only in a single field, the political,—a very important exception, I admit, and one which opens the door to a peril of stupendous proportions. But even there a deep change of spirit is foreshadowed although it has not yet taken definite form and has now to meet a fresh invasion of furious Europeanism inspired by the militant crudeness of proletarian Russia. Again he does not attach a sufficient importance to the increasing infiltration of India's spiritual thought into Europe and America, which is her characteristic retort to the European invasion. It is from this point of view that the whole question takes on a different aspect.

Sir John Woodroffe invites us to a vigorous self-defence. But defence by itself in the modern struggle can only end in defeat, and, if battle there must be, the only sound strategy is a vigorous aggression based on a strong, living and mobile defence; for by that aggressive force alone can the defence itself be effective. Why are a certain class of Indians still hypnotised in all fields by European culture and why are we all still hypnotised by it in the field of politics? Because they constantly saw all the power, creation, activity on the side of Europe, all the immobility or weakness of a static inefficient defence on the side of India. But wherever the Indian spirit has been able to react, to attack with energy and to create with éclat, the European glamour has begun immediately to lose its hypnotic power. No one now feels the weight of the religious assault from Europe

which was very powerful at the outset, because the creative activities of the Hindu revival have made Indian religion a living and evolving, a secure, triumphant and self-assertive power. But the seal was put to this work by two events, the Theosophical movement and the appearance of Swami Vivekananda at Chicago. For these two things showed the spiritual ideas for which India stands no longer on their defence but aggressive and invading the materialised mentality of the Occident. All India had been vulgarised and anglicised in its aesthetic notions by English education and influence, until the brilliant and sudden dawn of the Bengal school of art cast its rays so far as to be seen in Tokio, London and Paris. That significant cultural event has already effected an aesthetic revolution in the country, not yet by any means complete, but irresistible and sure of the future. The same phenomenon extends to other fields. Even in the province of politics that was the internal sense of the policy of the so-called extremist party in the Swadeshi movement; for it was a movement which attempted to override the previous apparent impossibility of political creation by the Indian spirit upon other than imitative European lines. If it failed for the time being, not by any falsity in its inspiration, but by the strength of a hostile pressure and the weakness still left by a past decadence, if its incipient creations were broken or left languishing and deprived of their original significance, yet it will remain as a finger-post on the roads. The attempt is bound to be renewed as soon as a wider gate is opened under more favourable conditions. Till that attempt comes and succeeds, a serious danger besets the soul of India; for a political Europeanisation would be followed by a social turn of the same kind and bring a cultural and spiritual death in its train. Aggression must be successful and creative if the defence is to be effective.

This great question must be given its larger world-wide import if we are to see it in its true lines. The principle of struggle, conflict and competition still governs and for some time will still govern international relations; for even if war is abolished in the near future by some as yet improbable good fortune of the race, conflict will take other forms. At the same time a certain growing

mutual closeness of the life of humanity is the most prominent phenomenon of the day. The War has brought it into violent relief; but the after-war is bringing out all its implications as well as the mass of its difficulties. This is as yet no real concert, still less the beginning of a true unity, but only a compelling physical oneness forced on us by scientific inventions and modern circumstances. But this physical oneness must necessarily bring its mental, cultural and psychological results. At first it will probably accentuate rather than diminish conflict in many directions, enhance political and economic struggles of many kinds and hasten too a cultural struggle. There it may bring about in the end a swallowing unification and a destruction of all other civilisations by one aggressive European type: whether that type will be bourgeois economical or labour materialistic or a rationalistic intellectualism cannot easily be foreseen, but at present in one form or another this is the actuality that is most in the front. On the other hand it may lead to a free concert with some underlying oneness. But the ideal of the entire separateness of the peoples each developing its sharply separatist culture with an alien exclusion law for other leading ideas and cultural forms, although it has been for some time abroad and was growing in vigour, is not likely to prevail. For that to happen the whole aim of unification preparing in Nature must fall to pieces, an improbable but not quite impossible catastrophe. Europe dominates the world and it is natural to forecast a Westernised world with such petty differences as might be permissible in a European unity given up to the rigorous scientific pursuit of the development and organisation of material life. Across this possibility falls the shadow of India.

Sir John Woodroffe quotes the dictum of Professor Lowes Dickinson that the opposition is not so much between Asia and Europe as between India and the rest of the world. There is a truth behind that dictum; but the cultural opposition of Europe and Asia remains an unabated factor. Spirituality is not the monopoly of India; however it may hide submerged in intellectualism or hid in other concealing veils, it is a necessary part of human nature. But the difference is between spirituality made the

leading motive and the determining power of both the inner and the outer life and spirituality suppressed, allowed only under disguises or brought in as a minor power, its reign denied or put off in favour of the intellect or of a dominant materialistic vitalism. The former way was the type of the ancient wisdom at one time universal in all civilised countries — literally, from China to Peru. But all other nations have fallen away from it and diminished its large pervasiveness or fallen away from it altogether as in Europe. Or they are now, as in Asia, in danger of abandoning it for the invading economic, commercial, industrial, intellectually utilitarian modern type. India alone, with whatever fall or decline of light and vigour, has remained faithful to the heart of the spiritual motive. India alone is still obstinately recalcitrant; for Turkey and China and Japan, say her critics, have outgrown that foolishness, by which it is meant that they have grown rationalistic and materialistic. India alone as a nation, whatever individuals or a small class may have done, has till now refused to give up her worshipped Godhead or bow her knee to the strong reigning idols of rationalism, commercialism and economism, the successful iron gods of the West. Affected she has been, but not yet overcome. Her surface mind rather than her deeper intelligence has been obliged to admit many Western ideas, liberty, equality, democracy and others, and to reconcile them with her Vedantic Truth; but she has not been altogether at ease with them in the Western form and she seeks about already in her thought to give to them an Indian which cannot fail to be a spiritualised turn. The first passion to imitate English ideas and culture has passed; but another more dangerous has recently taken its place, the passion to imitate continental European culture at large and in particular the crude and vehement turn of revolutionary Russia. On the other hand one sees a growing revival of this ancient Hindu religion and the immense sweep of a spiritual awakening and its significant movements. And out of this ambiguous situation there can be only one out of two issues. Either India will be rationalised and industrialised out of all recognition and she will be no longer India or else she will be the leader in a new world-phase, aid by her example and cultural

infiltration the new tendencies of the West and spiritualise the human race. That is the one radical and poignant question at issue. Will the spiritual motive which India represents prevail on Europe and create there new forms congenial to the West, or will European rationalism and commercialism put an end for ever to the Indian type of culture?

Not, then, whether India is civilised is the query that should be put, but whether the motive which has shaped her civilisation or the old-European intellectual or the new-European materialistic motive is to lead human culture. Is the harmony of the spirit, mind and body to found itself on the gross law of our physical nature, rationalised only or touched at the most by an ineffective spiritual glimmer, or is the dominant power of spirit to take the lead and force the lesser powers of the intellect, mind and body to a more exalted effort after a highest harmony, a victorious ever-developing equipoise? India must defend herself by reshaping her cultural forms to express more powerfully, intimately and perfectly her ancient ideal. Her aggression must lead the waves of the light thus liberated in triumphant self-expanding rounds all over the world which it once possessed or at least enlightened in far-off ages. An appearance of conflict must be admitted for a time, for as long as the attack of an opposite culture continues. But since it will be in effect an assistance to all the best that is emerging from the advanced thought of the Occident, it will culminate in the beginning of concert on a higher plane and a preparation of oneness.

“Is India Civilised?” – 2

THIS QUESTION of Indian civilisation, once it has raised this greater issue, shifts from its narrow meaning and disappears into a much larger problem. Does the future of humanity lie in a culture founded solely upon reason and science? Is the progress of human life the effort of a mind, a continuous collective mind constituted by an ever changing sum of transient individuals, that has emerged from the darkness of the unconscious material universe and is stumbling about in it in search of some clear light and some sure support amid its difficulties and problems? And does civilisation consist in man's endeavour to find that light and support in a rationalised knowledge and a rationalised way of life? An ordered knowledge of the powers, forces, possibilities of physical Nature and of the psychology of man as a mental and physical being is then the only true science. An ordered use of that knowledge for a progressive social efficiency and well-being, which will make his brief existence more efficient, more tolerable, more comfortable, happier, better appointed, more luxuriously enriched with the pleasures of the mind, life and body, is the only true art of life. All our philosophy, all our religion,—supposing religion has not been outgrown and rejected,—all our science, thought, art, social structure, law and institution must found itself upon this idea of existence and must serve this one aim and endeavour. This is the formula which European civilisation has accepted and is still labouring to bring into some kind of realisation. It is the formula of an intelligently mechanised civilisation supporting a rational and utilitarian culture.

Or is not the truth of our being rather that of a Soul embodied in Nature which is seeking to know itself, to find itself, to enlarge its consciousness, to arrive at a greater way of existence, to progress in the spirit and grow into the full light of self-

knowledge and some divine inner perfection? Are not religion, philosophy, science, thought, art, society, all life even means only of this growth, instruments of the spirit to be used for its service and with this spiritual aim as their dominant or at least their ultimate preoccupation? That is the idea of life and being,—the knowledge of it, as she claims,—for which India stood till yesterday and still strives to stand with all that is most persistent and powerful in her nature. It is the formula of a spiritualised civilisation striving through the perfection but also through an exceeding of mind, life and body towards a high soul-culture.

Whether the future hope of the race lies in a rational and an intelligently mechanised or in a spiritual, intuitive and religious civilisation and culture,—that, then, is the important issue. When the rationalist critic denies that India is or ever has been civilised, when he declares the Upanishads, the Vedanta, Buddhism, Hinduism, ancient Indian art and poetry a mass of barbarism, the vain production of a persistently barbaric mind, what he means is simply that civilisation is synonymous and identical with the cult and practice of the materialistic reason and that anything which falls below or goes above that standard does not deserve the name. A too metaphysical philosophy, a too religious religion,—if not indeed all philosophy and all religion,—any too idealistic and all mystic thought and art and every kind of occult knowledge, all that refines and probes beyond the limited purview of the reason dealing with the physical universe and seems therefore to it bizarre, over-subtle, excessive, unintelligible, all that responds to the sense of the Infinite, all that is obsessed with the idea of the eternal, and a society which is too much governed by ideas born of these things and not solely by intellectual clarity and the pursuit of a material development and efficiency, are not the products of civilisation, but the offspring of a crudely subtle barbarism. But this thesis obviously proves too much; most of the great past of humanity would fall under its condemnation. Even ancient Greek culture would not escape it; much of the thought and art of modern European civilisation itself would in that case have to be damned as at least semi-barbarous. Evidently, we cannot without falling

into exaggeration and absurdity narrow the sense of the word and impoverish the significance of the past strivings of the race. Indian civilisation in the past has been and must be recognised as the fruit of a great culture, quite as much as the Graeco-Roman, the Christian, the Islamic or the later Renaissance civilisation of Europe.

But the essential question remains open; the dispute is only narrowed to its central issue. A more moderate and perspicacious rationalistic critic would admit the past value of India's achievements. He would not condemn Buddhism and Vedanta and all Indian art and philosophy and social ideas as barbarous, but he would still contend that not there lies any future good for the human race. The true line of advance lies through European modernism, the mighty works of Science and the great modern adventure of humanity, its effort well founded not upon speculation and imagination but on ascertained and tangible scientific truth, its laboriously increased riches of sure and firmly tested scientific organisation. An Indian mind faithful to its ideals would contend on the contrary that while reason and science and all other auxiliaries have their place in the human effort, the real truth goes beyond them. The secret of our ultimate perfection is to be discovered deeper within us and things and Nature; it is to be sought centrally in spiritual self-knowledge and self-perfection and in the founding of life on that self-knowledge.

When the issue is so stated, we can at once see that the gulf between East and West, India and Europe is much less profound and unbridgeable now than it was thirty or forty years ago. The basic difference still remains; the life of the West is still chiefly governed by the rationalistic idea and a materialistic preoccupation. But at the summits of thought and steadily penetrating more and more downward through art and poetry and music and general literature an immense change is in progress. A reaching towards deeper things, an increasing return of seekings which had been banished, an urge towards higher experience yet unrealised, an admission of ideas long foreign to the Western mentality can be seen everywhere. Aiding this process and aided by it there has been a certain infiltration of Indian and Eastern

thought and influence; even here and there we find some growing recognition of the high value or the superior greatness of the ancient spiritual ideal. This infiltration began at a very early stage of the near contact between the farther Orient and Europe of which the English occupation of India was the most direct occasion. But at first it was a slight and superficial touch, at most an intellectual influence on a few superior minds. An academic interest or an attracted turn of scholars and thinkers towards Vedanta, Sankhya, Buddhism, admiration for the subtlety and largeness of Indian philosophic idealism, the stamp left by the Upanishads and the Gita on great intellects like Schopenhauer and Emerson and on a few lesser thinkers, this was the first narrow inlet of the floods. The impression did not go very far at the best and the little effect it might have produced was counteracted and even effaced for a time by the great flood of scientific materialism which submerged the whole life-view of later nineteenth-century Europe.

But now other movements have arisen and laid hold on thought and life with a triumphant success. Philosophy and thought have taken a sharp curve away from rationalistic materialism and its confident absolutisms. On the one hand, as a first consequence of the seeking for a larger thought and vision of the universe, Indian Monism has taken a subtle but powerful hold on many minds, though often in strange disguises. On the other hand new philosophies have been born, not indeed directly spiritual, vitalistic rather and pragmatic, but yet by their greater subjectivity already nearer to Indian ways of thinking. The old limits of scientific interest have begun to break down; various forms of psychical research and novel departures in psychology and even an interest in psychism and occultism, have come into increasing vogue and fasten more and more their hold in spite of the anathemas of orthodox religion and orthodox science. Theosophy with its comprehensive combinations of old and new beliefs and its appeal to ancient spiritual and psychic systems, has everywhere exercised an influence far beyond the circle of its professed adherents. Opposed for a long time with obloquy and ridicule, it has done much to spread the belief in Karma,

reincarnation, other planes of existence, the evolution of the embodied soul through intellect and psyche to spirit, ideas which once accepted must change the whole attitude towards life. Even Science itself is constantly arriving at conclusions which only repeat upon the physical plane and in its language truths which ancient India had already affirmed from the standpoint of spiritual knowledge in the tongue of the Veda and Vedanta. Every one of these advances leads directly or in its intrinsic meaning towards a nearer approach between the mind of East and West and to that extent to a likelihood of a better understanding of Indian thought and ideals.

In some directions the change of attitude has gone remarkably far and seems to be constantly increasing. A Christian missionary quoted by Sir John Woodroffe is "amazed to find the extent to which Hindu Pantheism has begun to permeate the religious conceptions of Germany, of America, even of England" and he considers its cumulative effect an imminent "danger" to the next generation. Another writer cited by him goes so far as to attribute all the highest philosophical thought of Europe to the previous thinking of the Brahmins and affirms even that all modern solutions of intellectual problems will be found anticipated in the East. A distinguished French psychologist recently told an Indian visitor that India had already laid down all the large lines and main truths, the broad schema, of a genuine psychology and all that Europe can now do is to fill them in with exact details and scientific verifications. These utterances are the extreme indications of a growing change of which the drift is unmistakable.

Nor is it only in philosophy and the higher thinking that this turn is visible. European art has moved in certain directions far away from its old moorings; it is developing a new eye and opening in its own manner to motives which until now were held in honour only in the East. Eastern art and decoration have begun to be widely appreciated and have exercised a strong if subtle influence. Poetry has for some time commenced to speak uncertainly a new language,—note that the world-wide fame of Tagore would have been unthinkable thirty years ago,—and

one often finds the verse even of ordinary writers teeming with thoughts and expressions which could formerly have found few parallels outside Indian, Buddhistic and Sufi poems. And there are some first preliminary signs of a similar phenomenon in general literature. More and more the seekers of new truth are finding their spiritual home in India or owe to her much of their inspiration or at least acknowledge her light and undergo her influence. If this turn continues to accentuate its drive, and there is little chance of a reversion, the spiritual and intellectual gulf between East and West if not filled up, will at least be bridged and the defence of Indian culture and ideals will stand in a stronger position.

But then, it may be said, if there is this certainty of an approximative understanding, what is the need of an aggressive defence of Indian culture or of any defence at all? Indeed, what is the need for the continuance of any distinctive Indian civilisation in the future? East and West will meet from two opposite sides and merge in each other and found in the life of a unified humanity a common world-culture. All previous or existing forms, systems, variations will fuse in this new amalgam and find their fulfilment. But the problem is not so easy, not so harmoniously simple. For, even if we could assume that in a united world-culture there would be no spiritual need and no vital utility for strong distinctive variations, we are still very far from any such oneness. The subjective and spiritual turn of the more advanced modern thought is still confined to a minority and has only very superficially coloured the general intelligence of Europe. Moreover, it is a movement of the thought only; the great life-motives of European civilisation stand as yet where they were. There is a greater pressure of certain idealistic elements in the proposed reshaping of human relations, but they have not shaken off or even loosened the yoke of the immediate materialistic past. It is precisely at this critical moment and in these conditions that the whole human world, India included, is about to be forced into the stress and travail of a swift transformation. The danger is that the pressure of dominant European ideas and motives, the temptations of the political needs of the hour, the velocity

of rapid inevitable change will leave no time for the growth of sound thought and spiritual reflection and may strain to bursting-point the old Indian cultural and social system, and shatter this ancient civilisation before India has had time to readjust her mental stand and outlook or to reject, remould or replace the forms that can no longer meet her environmental national necessities, create new characteristic powers and figures and find a firm basis for a swift evolution in the sense of her own spirit and ideals. In that event a rationalised and Westernised India, a brown ape of Europe, might emerge from the chaos, keeping some elements only of her ancient thought to modify, but no longer to shape and govern her total existence. Like other countries she would have passed into the mould of occidental modernism; ancient India would have perished.

Certain minds would see in this contingency no disaster, but rather a most desirable turn and a happy event. It would mean, in their view, that India had given up her spiritual separation and undergone the much needed intellectual and moral change that would at last entitle her to enter into the comity of modern peoples. And since in the new world-comity there would enter an increasing spiritual and subjective element and much perhaps of India's own religious and philosophical thought would be appropriated by its culture, the disappearance of her antique spirit and personal self-expression need be no absolute loss. Ancient India would have passed like ancient Greece, leaving its contribution to a new and more largely progressive life of the race. But the absorption of the Graeco-Roman culture by the later European world, even though many of its elements still survive in a larger and more complex civilisation, was yet attended with serious diminutions. There was a deplorable loss of its high and clear intellectual order, a still more calamitous perdition of the ancient cult of beauty, and even now after so many centuries there has been no true recovery of the lost spirit. A much greater diminution of the world's riches would result from the disappearance of a distinctive Indian civilisation, because the difference between its standpoint and that of European modernism is deeper, its spirit unique and the rich mass and diversity of its thousand

lines of inner experience a heritage that still India alone can preserve in its intricate truth and dynamic order.

The tendency of the normal Western mind is to live from below upward and from out inward. A strong foundation is taken in the vital and material nature and higher powers are invoked and admitted only to modify and partially uplift the natural terrestrial life. The inner existence is formed and governed by the external powers. India's constant aim has been on the contrary to find a basis of living in the higher spiritual truth and to live from the inner spirit outwards, to exceed the present way of mind, life and body, to command and dictate to external Nature. As the old Vedic seers put it, "Their divine foundation was above even while they stood below; let its rays be settled deep within us," *nīcīnāḥ sthur upari budhna eṣām, asme antar nīhitāḥ ketavah syuḥ*. Now that difference is no unimportant subtlety, but of a great and penetrating practical consequence. And we can see how Europe would deal with any spiritual influence by her treatment of Christianity and its inner rule which she never really accepted as the law of her life. It was admitted but only as an ideal and emotional influence and used only to chasten and give some spiritual colouring to the vital vigour of the Teuton and the intellectual clarity and sensuous refinement of the Latins. Any new spiritual development she might accept would be taken in the same way and used to a like limited and superficial purpose, if an insistent living culture were not there in the world to challenge this lesser ideal and insist on the true life of the spirit.

It may well be that both tendencies, the mental and the vital and physical stress of Europe and the spiritual and psychic impulse of India, are needed for the completeness of the human movement. But if the spiritual ideal points the final way to a triumphant harmony of manifested life, then it is all-important for India not to lose hold of the truth, not to give up the highest she knows and barter it away for a perhaps more readily practicable but still lower ideal alien to her true and constant nature. It is important too for humanity that a great collective effort to realise this highest ideal—however imperfect it may have been,

into whatever confusion and degeneration it may temporarily have fallen,—should not cease, but continue. Always it can recover its force and enlarge its expression; for the spirit is not bound to temporal forms but ever-new, immortal and infinite. A new creation of the old Indian *svadharma*, not a transmutation to some law of the Western nature, is our best way to serve and increase the sum of human progress.

There arises the necessity of a defence and a strong, even an aggressive defence; for only an aggressive defence can be effective in the conditions of the modern struggle. But here we find ourselves brought up against an opposite turn of mind and its stark obstructive temper. For there are plenty of Indians now who are for a stubbornly static defence, and whatever aggressiveness they put into it consists in a rather vulgar and unthinking cultural Chauvinism which holds that whatever we have is good for us because it is Indian or even that whatever is in India is best, because it is the creation of the Rishis. As if all the later clumsy and chaotic developments were laid down by those much misused, much misapplied and often very much forged founders of our culture. But the question is whether a static defence is of any effective value. I hold that it is of no value, because it is inconsistent with the truth of things and doomed to failure. It amounts to an attempt to sit stubbornly still while the Shakti of the world is rapidly moving on her way, and not only the Shakti of the world but the Shakti in India also. It is a determination to live only on our past cultural capital, to eke it out, small as it has grown in our wasteful and incompetent hands, to the last anna: but to live on our capital without using it for fresh gains is to end in bankruptcy and pauperism. The past has to be used and spent as mobile and current capital for some larger profit, acquisition and development of the future: but to gain we must release, we must part with something in order to grow and live more richly,—that is the universal law of existence. Otherwise the life within us will stagnate and perish in its immobile torpor. Thus to shrink from enlargement and change is too a false confession of impotence. It is to hold that India's creative capacity in religion and in philosophy came to

an end with Shankara, Ramanuja, Madhwa and Chaitanya and in social construction with Raghunandan and Vidyaranya. It is to rest in art and poetry either in a blank and uncreative void or in a vain and lifeless repetition of beautiful but spent forms and motives. It is to cling to social forms that are crumbling and will continue to crumble in spite of our efforts and risk to be crushed in their collapse.

The objection to any large change—for a large and bold change is needed and no peddling will serve our purpose—can be given a plausible turn only if we rest it on the contention that the forms of a culture are the right rhythm of its spirit and in breaking the rhythm we may expel the spirit and dissipate the harmony for ever. Yes, but though the Spirit is eternal in its essence and in the fundamental principles of its harmony immutable, the actual rhythm of its self-expression in form is ever mutable. Immutable in its being and in the powers of its being but richly mutable in life, that is the very nature of the spirit's manifested existence. And we have to see too whether the actual rhythm of the moment is still a harmony or whether it has not become in the hands of an inferior and ignorant orchestra a discord and no longer expresses rightly or sufficiently the ancient spirit. To recognise defect in the form is not to deny the inherent spirit; it is rather the condition for moving onward to a greater future amplitude, a more perfect realisation, a happier outflow of the Truth we harbour. Whether we shall actually find a greater expression than the past gave us, depends on our own selves, on our capacity of response to the eternal Power and Wisdom and the illumination of the Shakti within us and on our skill in works, the skill that comes by unity with the eternal spirit we are in the measure of our light labouring to express; *yogah karmasu kauśalam*.

This from the standpoint of Indian culture, and that must be always for us the first consideration and the intrinsic standpoint. But there is also the standpoint of the pressure of the Time Spirit upon us. For this too is the action of the universal Shakti and cannot be ignored, held at arm's length or forbidden entrance. Here too the policy of new creation imposes itself as the true and only effective way. Even if to stand still and stiff within our

well-defended gates were desirable, it is no longer possible. We can no longer take our single station apart in humanity, isolated like a solitary island in the desert ocean, neither going forth nor allowing to enter in,—if indeed we ever did it. For good or for ill the world is with us; the flood of modern ideas and forces are pouring in and will take no denial. There are two ways of meeting them, either to offer a forlorn and hopeless resistance or to seize and subjugate them. If we offer only an inert or stubborn passive resistance, they will still come in on us, break down our defences where they are weakest, sap them where they are stiffer, and where they can do neither, steal in unknown or ill-apprehended by underground mine and tunnel. Entering unassimilated they will act as disruptive forces, and it will be only partly by outward attack, but much more by an inward explosion that this ancient Indian civilisation will be shattered to pieces. Ominous sparks are already beginning to run about which nobody knows how to extinguish, and if we could extinguish them, we should be no better off, for we should yet have to deal with the source from which they are starting. Even the most rigid defenders of the present in the name of the past show in their every word how strongly they have been affected by new ways of thinking. Many if not most are calling passionately, calling inevitably for innovations in certain fields, changes European in spirit and method which, once admitted without some radical assimilation and Indianisation, will end by breaking up the whole social structure they think they are defending. That arises from confusion of thought and an incapacity of power. Because we are unable to think and create in certain fields, we are obliged to borrow without assimilation or with only an illusory pretence of assimilation. Because we cannot see the whole sense of what we are doing from a high inner and commanding point of vision, we are busy bringing together disparates without any saving reconciliation. A slow combustion and swift explosion are likely to be the end of our efforts.

Aggressive defence implies a new creation from this inner and commanding vision and while it demands a bringing of what we have to a more expressive force of form, it must allow also

an effective assimilation of whatever is useful to our new life and can be made harmonious with our spirit. Battle, shock and struggle themselves are no vain destruction; they are a violent cover for Time's great interchanges. Even the most successful victor receives much from the vanquished and if sometimes he appropriates it, as often it takes him prisoner. The Western attack is not confined to a breaking down of the forms of Eastern culture; there is at the same time a large, subtle and silent appropriation of much that is valuable in the East for the enrichment of occidental culture. Therefore to bring forward the glories of our past and scatter on Europe and America as much of its treasures as they will receive, will not save us. That liberality will enrich and strengthen our cultural assailants, but for us it will only serve to give a self-confidence which will be useless and even misleading if it is not made a force of will for a greater creation. What we have to do is to front the attack with new and more powerful formations which will not only throw it back, but even, where that is possible and helpful to the race, carry the war into the assailant's country. At the same time we must take by a strong creative assimilation whatever answers to our own needs and responds to the Indian spirit. In certain directions, as yet all too few, we have begun both these movements. In others we have simply created an unintelligent mixture or else have taken and are still taking over rash, crude and undigested borrowings. Imitation, a rough and haphazard borrowing of the assailant's engines and methods may be temporarily useful, but by itself it is only another way of submitting to conquest. A stark appropriation is not sufficient; successful assimilation to the Indian spirit is the needed movement. The problem is one of immense difficulty and stupendous in its proportions and we have not yet approached it with wisdom and insight. All the more pressing is the need to awaken to the situation and meet it with original thinking and a conscious action wise and powerful in insight and sure in process. A mastering and helpful assimilation of new stuff into an eternal body has always been in the past a peculiar power of the genius of India.

“Is India Civilised?” – 3

BUT THERE is yet another point of view from which the challenge put in front of us ceases to be an issue crudely and provokingly phrased in a conflict of cultures. Instead it presents itself as a problem with a deep significance; it becomes a thought-provoking suggestion that affects not only ours but all civilisations still in existence.

We can reply on the cultural issue from the view-point of the past and the valuation of different cultures as acquired contributions to the growth of the human race, that Indian civilisation has been the form and expression of a culture as great as any of the historic civilisations of mankind, great in religion, great in philosophy, great in science, great in thought of many kinds, great in literature, art and poetry, great in the organisation of society and politics, great in craft and trade and commerce. There have been dark spots, positive imperfections, heavy shortcomings; what civilisation has been perfect, which has not had its deep stains and cruel abysses? There have been considerable lacunae, many blind alleys, much uncultured or ill-cultured ground: what civilisation has been without its un-filled parts, its negative aspects? But our ancient civilisation can survive the severest comparisons of either ancient or mediaeval times. More high-reaching, subtle, many-sided, curious and profound than the Greek, more noble and humane than the Roman, more large and spiritual than the old Egyptian, more vast and original than any other Asiatic civilisation, more intellectual than the European prior to the eighteenth century, possessing all that these had and more, it was the most powerful, self-possessed, stimulating and wide in influence of all past human cultures.

And if we look from the view-point of the present and the fruitful workings of the progressive Time-Spirit, we can say that

even here in spite of our downfall all is not on the debit side. Many of the forms of our civilisation have become inapt and effete and others stand in need of radical change and renovation. But that can be said equally well of European culture; for all its recently acquired progressiveness and habit of more rapid self-adaptation, large parts of it are already rotten and out of date. In spite of all drawbacks and in spite of downfall the spirit of Indian culture, its central ideas, its best ideals have still their message for humanity and not for India alone. And we in India hold that they are capable of developing out of themselves by contact with new need and idea as good and better solutions of the problems before us than those which are offered to us secondhand from Western sources. But besides the comparisons of the past and the needs of the present there is too a view-point of the ideal future. There are the farther goals towards which humanity is moving,— and the present is only a crude aspiration towards them and the immediate future we now see in hope and strive to bring about in form, only its crude preparatory stage. There is an unrealised standard of the ideas which to the mind of the moment are figments of Utopia, but may become to a more developed humanity the commonplaces of their daily environment, the familiar things of the present which they have to overpass. How stands Indian civilisation with regard to this yet unrealised future of the race? Are its master ideas and dominant powers guiding lights or helping forces towards it or do they end in themselves with no vistas on the evolutionary potentialities of the earth's coming ages?

The very idea of progress is an illusion to some minds; for they imagine that the race moves constantly in a circle. Or even their view is that greatness more often than not is to be found in the past and that the line of our movement is a curve of deterioration, a downward lapse. But that is an illusion created when we look too much upon the highlights of the past and forget its shadows or concentrate too much on the dark spaces of the present and ignore its powers of light and its aspects of happier promise. It is created too by a mistaken deduction from the phenomenon of an uneven progress. For Nature effects her

evolution through a rhythm of advance and relapse, day and night, waking and sleep; there is a temporary pushing of certain results at the expense of others not less desirable for perfection and to a superficial eye there may seem to be a relapse even in our advance. Progress admittedly does not march on securely in a straight line like a man sure of his familiar way or an army covering an unimpeded terrain or well-mapped unoccupied spaces. Human progress is very much an adventure through the unknown, an unknown full of surprises and baffling obstacles; it stumbles often, it misses its way at many points, it cedes here in order to gain there, it retraces its steps frequently in order to get more widely forward. The present does not always compare favourably with the past; even when it is more advanced in the mass, it may still be inferior in certain directions important to our inner or our outer welfare. But earth does move forward after all, *eppur si muove*. Even in failure there is a preparation for success: our nights carry in them the secret of a greater dawn. This is a frequent experience in our individual progress, but the human collectivity also moves in much the same manner. The question is whither are we marching or what are the true routes and harbours of our voyage.

Western civilisation is proud of its successful modernism. But there is much that it has lost in the eagerness of its gains and much which men of old strove towards that it has not even attempted to accomplish. There is much too that it has wilfully flung aside in impatience or scorn to its own great loss, to the injury of its life, to the imperfection of its culture. An ancient Greek of the time of Pericles or the philosophers suddenly transported in time to this century would be astonished by the immense gains of the intellect and the expansion of the mind, the modern many-sidedness of the reason and inexhaustible habit of inquiry, the power of endless generalisation and precise detail. He would admire without reserve the miraculous growth of science and its giant discoveries, the abundant power, richness and minuteness of its instrumentation, the wonder-working force of its inventive genius. He would be overcome and stupefied rather than surprised and charmed by the enormous stir and

pulsation of modern life. But at the same time he would draw back repelled from its unashamed mass of ugliness and vulgarity, its unchastened external utilitarianism, its vitalistic riot and the morbid exaggeration and unsoundness of many of its growths. He would see in it much ill-disguised evidence of the uneliminated survival of the triumphant barbarian. If he recognised its intellectuality and the scrupulous application of thought and scientific reason to the machinery of life, he would miss in it his own later attempt at the clear and noble application of the ideal reason to the inner life of the mind and the soul. He would find that in this civilisation beauty had become an exotic and the shining ideal mind in some fields a debased and exploited slave and in others a neglected stranger. As for the great spiritual seekers of the past, they would experience in all this huge activity of the intellect and the life the sense of an aching void. A feeling of its illusion and unreality because that which is greatest in man and raises him beyond himself had been neglected, would oppress them at every step. The discovery of the laws of physical Nature would not compensate in their eyes for the comparative decline — for a long time it was the almost absolute cessation — of a greater seeking and finding, the discovery of the freedom of the spirit.

But an unbiassed view will prefer to regard this age of civilisation as an evolutionary stage, an imperfect but important turn of the human advance. It is then possible to see that great gains have been made which are of the utmost value to an ultimate perfection, even if they have been made at a great price. There is not only a greater generalisation of knowledge and more thorough use of intellectual power and activity in multiple fields. There is not only the advance of Science and its application to the conquest of our environment, an immense apparatus of means, vast utilisations, endless minute conveniences, an irresistible machinery, a tireless exploitation of forces. There is too a certain development of powerful if not high-pitched ideals and there is an attempt, however external and therefore imperfect, to bring them to bear upon the working of human society as a whole. Much has been diminished or lost, but it

can be recovered, eventually, if not with ease. Once restored to its true movement, the inner life of man will find that it has gained in materials, in power of plasticity, in a new kind of depth and wideness. And we shall have acquired a salutary habit of many-sided thoroughness and a sincere endeavour to shape the outer collective life into an adequate image of our highest ideals. Temporary diminutions will not count before the greater inner expansion that is likely to succeed this age of external turmoil and outward-looking endeavour.

If on the other hand an ancient Indian of the time of the Upanishads, the Buddhist period or the later classical age were to be set down in modern India and note that larger part of its life which belongs to the age of decline, he would experience a much more depressing sensation, the sense of a national, a cultural debacle, a fall from the highest summits to discouragingly low levels. He might well ask himself what this degenerate posterity had done with the mighty civilisation of the past. He would wonder how with so much to inspire, to elevate, to spur them to yet greater accomplishment and self-exceeding, they could have lapsed into this impotent and inert confusion and, instead of developing the high motives of Indian culture to yet deeper and wider issues, allowed them to overload themselves with ugly accretions, to rust, to rot, almost to perish. He would see his race clinging to forms and shells and rags of the past and missing nine-tenths of its nobler values. He would compare the spiritual light and energy of the heroic ages of the Upanishads and the philosophies with the later inertia or small and broken fragmentarily derivative activity of our philosophic thought. After the intellectual curiosity, the scientific development, the creative literary and artistic greatness, the noble fecundity of the classical age he would be amazed by the extent of a later degeneracy, its mental poverty, immobility, static repetition, the comparative feebleness of the creative intuition, the long sterility of art, the cessation of science. He would deplore a prone descent to ignorance, a failing of the old powerful will and tapasya, almost a volitional impotence. In place of the simpler and more spiritually rational order of old times he would find a bewildering chaotic

disorganised organisation of things without centre and without any large harmonising idea. He would find not a true social order but a half arrested, half hastening putrescence. In place of the great adaptable civilisation which assimilated with power and was able to return tenfold for what it received, he would meet a helplessness that bore passively or only with a few ineffectual galvanic reactions the forces of the outside world and the stress of adverse circumstance. At one time he would see that there had been even a loss of faith and self-confidence so considerable as to tempt the intellectuals of the nation to scrap the ancient spirit and ideals for an alien and imported culture. He would note indeed the beginning of a change, but might perhaps doubt how deep it had gone or whether it was powerful enough to save, forceful enough to upheave the whole nation from its cherished torpor and weakness, enlightened enough to guide a new and robust creative activity towards the building of new significant forms for the ancient spirit.

Here too a better understanding points to hope rather than to the flat despondency suggested by a too hasty surface glance. This last age of Indian history is an example of the constant local succession of night even to the most long and brilliant day in the evolution of the race. But it was a night filled at first with many and brilliant constellations and even at its thickest and worst it was the darkness of Kalidasa's *vīceya-tārakā prabhāta-kalpeva śarvari*, "night preparing for dawn, with a few just decipherable stars." Even in the decline all was not loss; there were needed developments, there were spiritual and other gains of the greatest importance for the future. If the high spiritualised mind and stupendous force of spiritual will, *tapasyā*, that characterised ancient India were less in evidence, there were new gains of spiritual emotion and sensitiveness to spiritual impulse on the lower planes of consciousness, that had been lacking before. Architecture, literature, painting, sculpture lost the grandeur, power, nobility of old, but evoked other powers and motives full of delicacy, vividness and grace. There was a descent from the heights to the lower levels, but a descent that gathered riches on its way and was needed for the fullness of spiritual discovery

and experience. And in the worst period of decline and failure the spirit was not dead in India, but only torpid, concealed and shackled; now emerging in answer to a pressure of constant awakening shocks for a strong self-liberation it finds that its sleep was a preparation of new potentialities behind the veil of that slumber. The decline of our past culture may even be regarded as a needed waning and dying of old forms to make way not only for a new, but, if we will that it should be so, a greater and more perfect creation.

For after all it is the will in the being that gives to circumstances their value, and often an unexpected value; the hue of apparent actuality is a misleading indicator. If the will in a race or civilisation is towards death, if it clings to the lassitude of decay and the laissez-faire of the moribund or even in strength insists blindly upon the propensities that lead to destruction or if it cherishes only the powers of dead Time and puts away from it the powers of the future, if it prefers life that was to life that will be, nothing, not even abundant strength and resources and intelligence, not even many calls to live and constantly offered opportunities will save it from an inevitable disintegration or collapse. But if there comes to it a strong faith in itself and a robust will to live, if it is open to the things that shall come, willing to seize on the future and what it offers and strong to compel it where it seems adverse, it can draw from adversity and defeat a force of invincible victory and rise from apparent helplessness and decay in a mighty flame of renovation to the light of a more splendid life. This is what Indian civilisation is now rearising to do as it has always done in the eternal strength of its spirit.

The greatness of the ideals of the past is a promise of greater ideals for the future. A continual expansion of what stood behind past endeavour and capacity is the one abiding justification of a living culture. But it follows that civilisation and barbarism are words of a quite relative significance. For from the view of the evolutionary future European and Indian civilisation at their best have only been half achievements, infant dawns pointing to the mature sunlight that is to come. Neither

Europe nor India nor any race, country or continent of mankind has ever been fully civilised from this point of view; none has grasped the whole secret of a true and perfect human living, none has applied with an entire insight or a perfectly vigilant sincerity even the little they were able to achieve. If we define civilisation as a harmony of spirit, mind and body, where has that harmony been entire or altogether real? Where have there not been glaring deficiencies and painful discords? Where has the whole secret of the harmony been altogether grasped in all its parts or the complete music of life evolved into the triumphant ease of a satisfying, durable and steadily mounting concord? Not only are there everywhere positive, ugly, even "hideous" blots on the life of man, but much that we now accept with equanimity, much in which we take pride, may well be regarded by a future humanity as barbarism or at least as semi-barbarous and immature. The achievements that we regard as ideal, will be condemned as a self-satisfied imperfection blind to its own errors; the ideas that we vaunt as enlightenment will appear as a demi-light or a darkness. Not only will many forms of our life that claim to be ancient or even eternal, as if that could be said of any form of things, fail and disappear; the subjective shapes given to our best principles and ideals will perhaps claim from the future at best an understanding indulgence. There is little that will not have to undergo expansion and mutation, change perhaps beyond recognition or accept to be modified in a new synthesis. In the end the coming ages may look on Europe and Asia of today much as we look on savage tribes or primitive peoples. And this view from the future, if we can get it, is undoubtedly the most illuminating and dynamic standpoint from which we can judge our present; but it does not invalidate our comparative appreciation of past and extant cultures.

For this past and present are creating the greater steps of that future and much of it will survive even in that which supplants it. There is behind our imperfect cultural figures a permanent spirit to which we must cling and which will remain permanent even hereafter; there are certain fundamental motives or essential idea-forces which cannot be thrown aside, because they are part

of the vital principle of our being and of the aim of Nature in us, our *svadharma*. But these motives, these idea-forces are, whether for nation or for humanity as a whole, few and simple in their essence and capable of an application always varying and progressive. The rest belongs to the less internal layers of our being and must undergo the changing pressure and satisfy the forward-moving demands of the Time-Spirit. There is this permanent spirit in things and there is this persistent *swadharma* or law of our nature; but there is too a less binding system of laws of successive formulation,—rhythms of the spirit, forms, turns, habits of the nature, and these endure the mutations of the ages, *yugadharma*. The race must obey this double principle of persistence and mutation or bear the penalty of a decay and deterioration that may attain even its living centre.

Certainly we must repel with vigour every disintegrating or injurious attack; but it is much more important to form our own true and independent view of our own past achievement, present position and future possibilities,—what we were, what we are and what we may be. In our past we must distinguish all that was great, essential, elevating, vitalising, illuminating, victorious, effective. And in that again we must distinguish what was close to the permanent, essential spirit and the persistent law of our cultural being and separate from it what was temporary and transiently formulative. For all that was great in the past cannot be preserved as it was or repeated for ever; there are new needs, there are other vistas before us. But we have to distinguish too what was deficient, ill-grasped, imperfectly formulated or only suited to the limiting needs of the age or unfavourable circumstances. For it is quite idle to pretend that all in the past, even at its greatest, was entirely admirable and in its kind the highest consummate achievement of the human mind and spirit. Afterwards we have to make a comparison of this past with our present and to understand the causes of our decline and seek the remedy of our shortcomings and ailments. Our sense of the greatness of our past must not be made a fatally hypnotising lure to inertia; it should be rather an inspiration to renewed and greater achievement. But in our criticism of the present we

must not be one-sided or condemn with a foolish impartiality all that we are or have done. Neither flattering or glossing over our downfall nor fouling our nest to win the applause of the stranger, we have to note our actual weakness and its roots, but to fix too our eyes with a still firmer attention on our elements of strength, our abiding potentialities, our dynamic impulses of self-renewal.

A second comparison has to be made between the West and India. In the past of Europe and the past of India we can observe with an unbiassed mind the successes of the West, the gifts it brought to humanity, but also its large gaps, striking deficiencies, terrible and even "hideous" vices and failures. On the other balance we have to cast ancient and mediaeval India's achievements and failures. Here we shall find that there is little for which we need lower our heads before Europe and much in which we rise well and sometimes immeasurably above her. But we have to scrutinise next the present of the West in its strong success, vitality, conquering insolence. What has been great in it we shall allow, but take deep note too of its defects, stumblings and dangers. And with this dangerous greatness we must compare the present of India, her downfall and its causes, her velleities of revival, her elements that still make for superiority now and in the future. Let us see and take account of all that we must inevitably receive from the West and consider how we can assimilate it to our own spirit and ideals. But let us see too what founts of native power there are in ourselves from which we can draw deeper, more vital and fresher streams of the power of life than from anything the West can offer. For that will help us more than occidental forms and motives, because it will be more natural to us, more stimulating to our idiosyncrasy of nature, more packed with creative suggestions, more easily taken up and completely followed in power of practice.

But far more helpful than any of these necessary comparisons will be the forward look from our past and present towards our own and not any foreign ideal of the future. For it is our evolutionary push towards the future that will give to our past and present their true value and significance. India's nature, her

mission, the work that she has to do, her part in the earth's destiny, the peculiar power for which she stands is written there in her past history and is the secret purpose behind her present sufferings and ordeals. A reshaping of the forms of our spirit will have to take place; but it is the spirit itself behind past forms that we have to disengage and preserve and to give to it new and powerful thought-significances, culture-values, a new instrumentation, greater figures. And so long as we recognise these essential things and are faithful to their spirit, it will not hurt us to make even the most drastic mental or physical adaptations and the most extreme cultural and social changes. But these changes themselves must be cast in the spirit and mould of India and not in any other, not in the spirit of America or Europe, not in the mould of Japan or Russia. We must recognise the great gulf between what we are and what we may and ought to strive to be. But this we must do not in any spirit of discouragement or denial of ourselves and the truth of our spirit, but in order to measure the advance we have to make. For we have to find its true lines and to find in ourselves the aspiration and inspiration, the fire and the force to conceive them and to execute.

An original truth-seeking thought is needed if we are to take this stand and make this movement, a strong and courageous intuition, an unfailing spiritual and intellectual rectitude. The courage to defend our culture against ignorant occidental criticism and to maintain it against the gigantic modern pressure comes first, but with it there must be the courage to admit not from any European standpoint but from our own outlook the errors of our culture. Apart from all phenomena of decline or deterioration, we should recognise without any sophistical denial those things in our creeds of life and social institutions which are in themselves mistaken and some of them indefensible, things weakening to our national life, degrading to our civilisation, dishonouring to our culture. A flagrant example can be found in the treatment of our outcastes. There are those who would excuse it as an unavoidable error in the circumstances of the past; there are others who contend that it was the best possible solution then available. There are still others who would justify

it and, with whatever modifications, prolong it as necessary to our social synthesis. The contention is highly disputable. The excuse was there, but it is no justification for continuance. A solution which condemns by segregation one sixth of the nation to permanent ignominy, continued filth, uncleanliness of the inner and outer life and a brutal animal existence instead of lifting them out of it is no solution but rather an acceptance of weakness and a constant wound to the social body and to its collective spiritual, intellectual, moral and material welfare. A social synthesis which can only live by making a permanent rule of the degradation of our fellowmen and countrymen stands condemned and foredoomed to decay and disturbance. The evil effects may be kept under for a long time and work only by the subtler unobserved action of the law of Karma; but once the light of Truth is let in on these dark spots, to perpetuate them is to maintain a seed of disruption and ruin our chances of eventual survival.

Again, we have to look on our cultural ideas and our social forms and see where they have lost their ancient spirit or real significance. Many of them are now a fiction and no longer in accordance with the ideas they assume or with the facts of life. Others even if good in themselves or else beneficent in their own time are no longer sufficient for our growth. All these must either be transformed or discarded and truer ideas and better formulations must be found in their place. The new turn we must give them will not always be a return upon their old significance. The new dynamic truths we have to discover need not be parked within the limited truth of a past ideal. On our past and present ideals we have to turn the searchlight of the spirit and see whether they have not to be surpassed or enlarged or brought into consonance with new wider ideals. All we do or create must be consistent with the abiding spirit of India, but framed to fit into a greater harmonised rhythm and plastic to the call of a more luminous future. If faith in ourselves and fidelity to the spirit of our culture are the first requisites of a continued and vigorous life, a recognition of greater possibilities is a condition not less indispensable. There cannot be a healthy and victorious

survival if we make of the past a fetish instead of an inspiring impulse.

The spirit and ideals of our civilisation need no defence, for in their best parts and in their essence they were of eternal value. India's internal and individual seeking of them was earnest, powerful, effective. But the application in the collective life of society was subjected to serious reserves. Never sufficiently bold and thoroughgoing, it became more and more limited and halting when the life-force declined in her peoples. This defect, this gulf between ideal and collective practice, has pursued all human living and was not peculiar to India; but the dissonance became especially marked with the lapse of time and it put at last on our society a growing stamp of weakness and failure. There was a large effort in the beginning at some kind of synthesis between the inner ideal and the outer life; but a static regulation of society was its latter end. An underlying principle of spiritual idealism, an elusive unity and fixed helpful forms of mutuality remained always there, but also an increasing element of strict bondage and minute division and fissiparous complexity in the social mass. The great Vedantic ideals of freedom, unity and the godhead in man were left to the inner spiritual effort of individuals. The power of expansion and assimilation diminished and when powerful and aggressive forces broke in from outside, Islam, Europe, the later Hindu society was content with an imprisoned and static self-preservation, a mere permission to live. The form of living became more and more narrow and it endured a continually restricted assertion of its ancient spirit. Duration, survival was achieved, but not in the end a really secure and vital duration, not a great, robust and victorious survival.

And now survival itself has become impossible without expansion. If we are to live at all, we must resume India's great interrupted endeavour; we must take up boldly and execute thoroughly in the individual and in the society, in the spiritual and in the mundane life, in philosophy and religion, in art and literature, in thought, in political and economic and social formulation the full and unlimited sense of her highest spirit

and knowledge. And if we do that, we shall find that the best of what comes to us draped in occidental forms, is already implied in our own ancient wisdom and has there a greater spirit behind it, a profounder truth and self-knowledge and the capacity of a will to nobler and more ideal formations. Only we need to work out thoroughly in life what we have always known in the spirit. There and nowhere else lies the secret of the needed harmony between the essential meaning of our past culture and the environmental requirements of our future.

That view opens out a prospect beyond the battle of cultures which is the immediate dangerous aspect of the meeting of East and West. The Spirit in man has one aim before it in all mankind; but different continents or peoples approach it from different sides, with different formulations and in a differing spirit. Not recognising the underlying unity of the ultimate divine motive, they give battle to each other and claim that theirs alone is the way for mankind. The one real and perfect civilisation is the one in which they happen to be born, all the rest must perish or go under. But the real and perfect civilisation yet waits to be discovered; for the life of mankind is still nine tenths of barbarism to one tenth of culture. The European mind gives the first place to the principle of growth by struggle; it is by struggle that it arrives at some kind of concert. But this concert is itself hardly more than an organisation for growth by competition, aggression and farther battle. It is a peace that is constantly breaking, even within itself, into a fresh strife of principles, ideas, interests, races, classes. It is an organisation precarious at its base and in its centre because it is founded on half-truths that deteriorate into whole falsehoods; but it is still or has been till now vigorous in constant achievement and able to grow powerfully and to devour and assimilate. Indian culture proceeded on the principle of a concert that strove to find its base in a unity and reached out again towards some greater oneness. Its aim was a lasting organisation that would minimise or even eliminate the principle of struggle. But it ended by achieving peace and stable arrangement through exclusion, fragmentation and immobility of status; it drew a magic circle of safety and shut itself up in it for good.

In the end it lost its force of aggression, weakened its power of assimilation and decayed within its barriers. A static and limited concert, not always enlarging itself, not plastic becomes in our human state of imperfection a prison or a sleeping-chamber. Concert cannot be anything but imperfect and provisional in its form and can only preserve its vitality and fulfil its ultimate aim if it constantly adapts, expands, progresses. Its lesser unities must widen towards a broader and more comprehensive and above all a more real and spiritual oneness. In the larger statement of our culture and civilisation that we have now to achieve, a greater outward expression of spiritual and psychological oneness, but with a diversity which the mechanical method of Europe does not tolerate, will surely be one leading motive. A concert, a unity with the rest of mankind, in which we shall maintain our spiritual and our outer independence will be another line of our endeavour. But what now appears as a struggle may well be the first necessary step, before we can formulate that unity of mankind which the West sees only in idea, but cannot achieve because it does not possess its spirit. Therefore Europe labours to establish unity by accommodation of conflicting interests and the force of mechanical institutions; but so attempted, it will either not be founded at all or will be founded on sand. Meanwhile she wishes to blot out every other culture, as if hers were the only truth or all the truth of life and there were no such thing as truth of the spirit. India, the ancient possessor of the truth of the spirit, must resist that arrogant claim and aggression and affirm her own deeper truths in spite of heavy odds and against all comers. For in its preservation lies the only hope that mankind instead of marching to a new cataclysm and primitive beginning with a constant repetition of the old blind cycles will at last emerge into the light and accomplish the drive forward which will bring the terrestrial evolution to its next step of ascent in the progressive manifestation of the Spirit.

A Defence of Indian Culture

I

A Rationalistic Critic on Indian Culture

WHEN we try to appreciate a culture, and when that culture is the one in which we have grown up or from which we draw our governing ideals and are likely from overpartiality to minimise its deficiencies or from over-familiarity to miss aspects or values of it which would strike an unaccustomed eye, it is always useful as well as interesting to know how others see it. It will not move us to change our view-point for theirs; but we can get fresh light from a study of this kind and help our self-introspection. But there are different ways of seeing a foreign civilisation and culture. There is the eye of sympathy and intuition and a close appreciative self-identification: that gives us work like Sister Nivedita's *Web of Indian Life* or Mr. Fielding's book on Burma or Sir John Woodroffe's studies of Tantra. These are attempts to push aside all concealing veils and reveal the soul of a people. It may well be that they do not give us all the hard outward fact, but we are enlightened of something deeper which has its greater reality; we get not the thing as it is in the deficiencies of life, but its ideal meaning. The soul, the essential spirit is one thing, the forms taken in this difficult human actuality are another and are often imperfect or perverted; neither can be neglected if we would have a total vision. Then there is the eye of the discerning and dispassionate critic who tries to see the thing as it is in its intention and actuality, apportion the light and shade, get the balance of merit and defect, success and failure, mark off that which evokes appreciative sympathy from that which calls for critical censure. We may not always agree; the standpoint is different and by its externality, by failure of intuition and self-identification it may miss things that are essential or may not

get the whole meaning of that which it praises or condemns: still we profit, we can add to our sense of shade and tone or correct our own previous judgment. Finally there is the eye of the hostile critic, convinced of the inferiority of the culture in question, who gives plainly and honestly without deliberate overcharging what he conceives to be sound reason for his judgment. That too has its use for us; hostile criticism of this kind is good for the soul and the intellect, provided we do not allow ourselves to be afflicted, beaten down or shaken from the upholding centre of our living faith and action. Most things in our human world are imperfect and it is sometimes well to get a strong view of our imperfections. Or, if nothing else, we can at least learn to appreciate opposite standpoints and get at the source of the opposition; wisdom, insight and sympathy grow by such comparisons.

But hostile criticism to be of any sound value must be criticism, not slander and false witness, not vitriol-throwing: it must state the facts without distortion, preserve consistent standards of judgment, observe a certain effort at justice, sanity, measure. Mr. William Archer's well-known book on India, which on account of its very demerits I have taken as the type of the characteristic Western or anti-Indian regard on our culture, was certainly not of this character. It is not only that here we have a wholesale and unsparing condemnation, a picture all shade and no light: that is a recommendation, for Mr. Archer's professed object was to challenge the enthusiastic canonisation of Indian culture by its admirers in the character of a devil's advocate whose business is to find out and state in its strongest terms everything that can be said against the claim. And for us too it is useful to have before us an attack which covers the whole field so that we may see in one comprehensive view the entire enemy case against our culture. But there are three vitiating elements in his statement. First, it had an ulterior, a political object; it started with the underlying idea that India must be proved altogether barbarous in order to destroy or damage her case for self-government. That sort of extraneous motive at once puts his whole pleading out of court; for it means a constant deliberate distortion in order to serve a material interest, foreign altogether

to the disinterested intellectual objects of cultural comparison and criticism.

In fact this book is not criticism; it is literary or rather journalistic pugilism. There too it is of a peculiar kind; it is a furious sparring at a lay figure of India which is knocked down at pleasure through a long and exuberant dance of misstatement and exaggeration in the hope of convincing an ignorant audience that the performer has prostrated a living adversary. Sanity, justice, measure are things altogether at a discount: a show-off of the appearance of staggering and irresistible blows is the object held in view, and for that anything comes in handy,—the facts are altogether misstated or clumsily caricatured, the most extraordinary and unfounded suggestions advanced with an air of obviousness, the most illogical inconsistencies permitted if an apparent point can be scored. All this is not the occasional freak of a well-informed critic suffering from a fit of mental biliousness and impelled to work it off by an extravagant intellectual exercise, an irresponsible fantasia or a hostile war-dance around a subject with which he is not in sympathy. That is a kind of extravagance, which is sometimes permissible and may be interesting and amusing. It is a sweet and pleasant thing, cries the Roman poet, to play the fool in place and right season, *dulce est desipere in loco*. But Mr. Archer's constant departures into irrational extravagance are not by any means *in loco*. We discover very soon,—in addition to his illegitimate motive and his deliberate unfairness this is a third and worst cardinal defect,—that for the most part he knew absolutely nothing about the things on which he was passing his confident damning judgments. What he has done is to collect together in his mind all the unfavourable comments he had read about India, eke them out with casual impressions of his own and advance this unwholesome and unsubstantial compound as his original production, although his one genuine and native contribution is the cheery cocksureness of his secondhand opinions. The book is a journalistic fake, not an honest critical production.

The writer was evidently no authority on metaphysics, which he despises as a misuse of the human mind; yet he lays

down the law at length about the values of Indian philosophy. He was a rationalist to whom religion is an error, a psychological disease, a sin against reason; yet he adjudges here between the comparative claims of religions, assigning a *proxime accessit* to Christianity, mainly, it seems, because Christians do not seriously believe in their own religion,—let not the reader laugh, the book advances quite seriously this amazing reason,—and bestowing the wooden spoon on Hinduism. He admits his incompetence to speak about music, yet that has not prevented him from relegating Indian music to a position of hopeless inferiority. His judgment on art and architecture is of the narrowest kind; but he is generously liberal of his decisive depreciations. In drama and literature one would expect from him better things; but the astonishing superficiality of his standards and his arguments here leaves one wondering how in the world he got his reputation as a dramatic and literary critic: one concludes that either he must have used a very different method in dealing with European literature or else it is very easy to get a reputation of this kind in England. An ill-informed misrepresentation of facts, a light-hearted temerity of judgment on things he has not cared to study constitute this critic's title to write on Indian culture and dismiss it authoritatively as a mass of barbarism.

It is not then for a well-informed outside view or even an instructive adverse criticism of Indian civilisation that I have turned to Mr. William Archer. In the end it is only those who possess a culture who can judge the intrinsic value of its productions, because they alone can enter entirely into its spirit. To the foreign critic we can only go for help in forming a comparative judgment,—which too is indispensable. But if for any reason we had to depend on a foreign judgment for the definitive view of these things, it is evident that in each field it is to men who can speak with some authority that we must turn. It matters very little to me what Mr. Archer or Dr. Gough or Sir John Woodroffe's unnamed English professor may say about Indian philosophy; it is enough for me to know what Emerson or Schopenhauer or Nietzsche, three entirely different minds of the greatest power in this field, or what thinkers like Cousin

and Schlegel have to say about it or to mark the increasing influence of some of its conceptions, the great parallel lines of thought in earlier European thinking and the confirmations of ancient Indian metaphysics and psychology which are the results of the most modern research and inquiry. For religion I shall not go to Mr. Harold Begbie or any European atheist or rationalist for a judgment on our spirituality, but see rather what are the impressions of open-minded men of religious feeling and experience who can alone be judges, a spiritual and religious thinker such as Tolstoy, for instance. Or I may study even, allowing for an inevitable bias, what the more cultured Christian missionary has to say about a religion which he can no longer dismiss as a barbarous superstition. In art I shall not turn to the opinion of the average European who knows nothing of the spirit, meaning or technique of Indian architecture, painting and sculpture. For the first I shall consult some recognised authority like Fergusson; for the others if critics like Mr. Havell are to be dismissed as partisans, I can at least learn something from Okakura or Mr. Laurence Binyon. In literature I shall be at a loss, for I cannot remember that any Western writer of genius or high reputation as a critic has had any first-hand knowledge of Sanskrit literature or of the Prakritic tongues, and a judgment founded on translations can only deal with the substance,—and even that in most translations of Indian work is only the dead substance with the whole breath of life gone out of it. Still even here Goethe's well-known epigram on the *Shakuntala* will be enough by itself to show me that all Indian writing is not of a barbarous inferiority to European creation. And perhaps we may find a scholar here and there with some literary taste and judgment, not a too common combination, who will be of help to us. This sort of excursion will certainly not give us an entirely reliable scheme of values, but at any rate we shall be safer than in a resort to the great lowland clan of Goughs, Archers and Begbies.

If I still find it necessary or useful to notice these lucubrations, it is for quite another purpose. Even for that purpose all that Mr. Archer writes is not of utility; much of it is so

irrational, inconsequent or unscrupulous in suggestion that one can only note and pass on. When for instance he assures his readers that Indian philosophers think that sitting cross-legged and contemplating one's own navel is the best way of ascertaining the truths of the universe and that their real object is an indolent immobility and to live upon the alms of the faithful, his object in thus describing one of the postures of abstracted meditation is to stamp the meditation itself in the eyes of ignorant English readers with the character of a bovine absurdity and a selfish laziness; that is an instance of his unscrupulousness which helps us to observe the kinks of his own rationalistic mind, but is useful for nothing else. When he denies that there is any real morality in Hinduism or affirms that it has never claimed moral teaching as one of its functions, statements which are the exact contrary of the facts, when he goes so far as to say that Hinduism is the character of the people and it indicates a melancholy proclivity towards *whatever* is monstrous and unwholesome, one can only conclude that truth-speaking is not one of the ethical virtues which Mr. William Archer thought it necessary to practise or at least that it need be no part of a rationalist's criticism of religion.

But no, after all Mr. Archer does throw a grudging tribute on the altar of truth; for he admits in the same breath that Hinduism talks much of righteousness and allows that there are in the Hindu writings many admirable ethical doctrines. But that only proves that Hindu philosophy is illogical,—the morality is there indeed, but it ought not to be; its presence does not suit Mr. Archer's thesis. Admire the logic, the rational consistency of this champion of rationalism! Mark that at the same time one of his objections to the Ramayana, admitted to be one of the Bibles of the Hindu people, is that its ideal characters, Rama and Sita, the effective patterns of the highest Indian manhood and womanhood, are much too virtuous for his taste. Rama is too saintly for human nature. I do not know in fact that Rama is more saintly than Christ or St. Francis, yet I had always thought they were within the pale of human nature; but perhaps this critic will reply that, if not beyond that

pale, their excessive virtues are at least like the daily practice of the Hindu cult,—shall we say for example, scrupulous physical purity and personal cleanliness and the daily turning of the mind to God in worship and meditation,—“sufficient to place them beyond the pale of civilisation.” For he tells us that Sita, the type of conjugal fidelity and chastity, is so excessive in her virtue “as to verge on immorality.” Meaningless smart extravagance has reached its highest point when it can thus verge on the idiotic. I am as sorry to use the epithet as Mr. Archer to harp on Indian “barbarism”, but there is really no help for it; “it expresses the essence of the situation.” If all were of this character,—there is too much of it and it is deplorable,—a contemptuous silence would be the only possible reply. But fortunately Apollo does not always stretch his bow thus to the breaking-point; all Mr. Archer’s shafts are not of this wildgoose flight. There is much in his writing that expresses crudely, but still with sufficient accuracy the feeling of recoil of the average occidental mind at its first view of the unique characteristics of Indian culture and that is a thing worth noting and sounding; it is necessary to understand it and find out its value.

This is the utility I wish to seize on; for it is an utility and even more. It is through the average mind that we get best at the bedrock of the psychological differences which divide from each other great blocks of our common humanity. The cultured mind tends to diminish the force of these prejudices or at least even in difference and opposition to develop points of similarity or of contact. In the average mentality we have a better chance of getting them in their crude strength and can appreciate their full force and bearing. Mr. Archer helps us here admirably. Not that we have not to clear away much rubbish to get at what we want. I should have preferred to deal with a manual of misunderstanding which had the same thoroughness of scope, but expressed itself with a more straightforward simplicity and less of vicious smartness and of superfluous ill-will; but none such is available. Let us take Mr. Archer then and dissect some of his prejudices to get at their inner psychology. We shall perhaps

find that through all this unpleasant crudity we can arrive at the essence of a historic misunderstanding of continents. An exact understanding of it may even help us towards an approach to some kind of reconciliation.

II

A Rationalistic Critic on Indian Culture—2

IT IS best to start with a precise idea of the species of critic from whom we are going to draw our estimate of oppositions. What we have before us are the ideas of an average and typical occidental mind on Indian culture, a man of sufficient education and wide reading, but no genius or exceptional capacity, rather an ordinary successful talent, no flexibility or broad sympathy of mind, but pronounced and rigid opinions which are backed up and given an appearance of weight by the habit of using to good effect a varied though not always sound information. This is in fact the mind and standpoint of an average Englishman of some ability formed in the habit of journalism. That is precisely the kind of thing we want in order to seize the nature of the antagonism which led Mr. Rudyard Kipling,—himself a super-journalist and “magnified non-natural” average man, the average lifted up, without ceasing to be itself, by the glare of a kind of crude and barbaric genius,—to affirm the eternal incompatibility of the East and the West. Let us see what strikes such a mentality as unique and abhorrent in the Indian mind and its culture: if we can put aside all sensitiveness of personal feeling and look dispassionately at this phenomenon, we shall find it an interesting and illuminative study.

A certain objection may be advanced against taking a rationalistic critic with a political bias, a mind belonging at best to the today which is already becoming yesterday, in this widely representative capacity. The misunderstanding of continents has been the result of a long-enduring and historic difference, and this book gives us only one phase of it which is of a very modern character. But it is in modern times, in an age of scientific and rationalistic enlightenment, that the difference has become

most pronounced, the misunderstanding most aggressive and the sense of cultural incompatibility most conscious and self-revealing. An ancient Greek, full of disinterested intellectual curiosity and a flexible aesthetic appreciation, was in spite of his feeling of racial and cultural superiority to the barbarian much nearer to the Indian mind than a typical modern European. Not only could a Pythagoras or a philosopher of the Neo-platonist school, an Alexander or a Menander understand with a more ready sympathy the root ideas of Asiatic culture, but an average man of ability, a Megasthenes for instance, could be trusted to see and understand, though not inwardly and perfectly, yet in a sufficient measure. The mediaeval European, for all his militant Christianity and his prejudice against the infidel and paynim, yet resembled his opponent in many characteristic ways of seeing and feeling to an extent which is no longer possible to an average European mind, unless it has been imbued with the new ideas which are once more lessening the gulf between the continents. It was the rationalising of the occidental mind, the rationalising even of its religious ideas and sentiments, which made the gulf so wide as to appear unbridgeable. Our critic represents this increased hostility in an extreme form, a shape given to it by the unthinking free-thinker, the man who has not thought out originally these difficult problems, but imbibed his views from his cultural environment and the intellectual atmosphere of the period. He will exaggerate enormously the points of opposition, but by his very exaggeration he will make them more strikingly clear and intelligible. He will make up for his want of correct information and intelligent study by a certain sureness of instinct in his attack upon things alien to his own mental outlook.

It is this sureness of instinct which has led him to direct the real gravamen of his attack against Indian philosophy and religion. The culture of a people may be roughly described as the expression of a consciousness of life which formulates itself in three aspects. There is a side of thought, of ideal, of upward will and the soul's aspiration; there is a side of creative self-expression and appreciative aesthetics, intelligence and imagination; and there is a side of practical and outward formulation.

A people's philosophy and higher thinking give us its mind's purest, largest and most general formulation of its consciousness of life and its dynamic view of existence. Its religion formulates the most intense form of its upward will and the soul's aspirations towards the fulfilment of its highest ideal and impulse. Its art, poetry, literature provide for us the creative expression and impression of its intuition, imagination, vital turn and creative intelligence. Its society and politics provide in their forms an outward frame in which the more external life works out what it can of its inspiring ideal and of its special character and nature under the difficulties of the environment. We can see how much it has taken of the crude material of living, what it has done with it, how it has shaped as much of it as possible into some reflection of its guiding consciousness and deeper spirit. None of them express the whole secret spirit behind, but they derive from it their main ideas and their cultural character. Together they make up its soul, mind and body. In Indian civilisation philosophy and religion, philosophy made dynamic by religion, religion enlightened by philosophy have led, the rest follow as best they can. This is indeed its first distinctive character, which it shares with the more developed Asiatic peoples, but has carried to an extraordinary degree of thoroughgoing pervasiveness. When it is spoken of as a Brahminical civilisation, that is the real significance of the phrase. The phrase cannot truly imply any domination of sacerdotalism, though in some lower aspects of the culture the sacerdotal mind has been only too prominent; for the priest as such has had no hand in shaping the great lines of the culture. But it is true that its main motives have been shaped by philosophic thinkers and religious minds, not by any means all of them of Brahmin birth. The fact that a class has been developed whose business was to preserve the spiritual traditions, knowledge and sacred law of the race,—for this and not a mere priest trade was the proper occupation of the Brahmin,—and that this class could for thousands of years maintain in the greatest part, but not monopolise, the keeping of the national mind and conscience, and the direction of social principles, forms and manners, is only a characteristic

indication. The fact behind is that Indian culture has been from the beginning and has remained a spiritual, an inward-looking religio-philosophical culture. Everything else in it has derived from that one central and original peculiarity or has been in some way dependent on it or subordinate to it; even external life has been subjected to the inward look of the spirit.

Our critic has felt the importance of this central point and directed upon it his most unsparing attack; in other quarters he may make concessions, allow attenuations, here he will make none. All here must be bad and harmful, or if not deleterious, then ineffective, by the very nature of the central ideas and motives, for any real good. This is a significant attitude. Of course there is the polemical motive. That which is claimed for the Indian mind and its civilisation is a high spirituality, high on all the summits of thought and religion, permeating art and literature and religious practice and social ideas and affecting even the ordinary man's attitude to life. If the claim is conceded, as it is conceded by all sympathetic and disinterested inquirers even when they do not accept the Indian view of life, then Indian culture stands, its civilisation has a right to live. More, it has a right even to throw a challenge to rationalistic modernism and say, "Attain first my level of spirituality before you claim to destroy and supersede me or call on me to modernise myself entirely in your sense. No matter if I have myself latterly fallen from my own heights or if my present forms cannot meet all the requirements of the future mind of humanity; I can reascend, the power is there in me. I may even be able to develop a spiritual modernism which will help you in your effort to exceed yourself and arrive at a larger harmony than any you have reached in the past or can dream of in the present." The hostile critic feels that he must deny this claim at its roots. He tries to prove Indian philosophy to be unspiritual and Indian religion to be an irrational animistic cult of monstrosity. In this effort which is an attempt to stand Truth on her head and force her to see facts upside down, he lands himself in a paradoxical absurdity and inconsistency which destroy his case by sheer overstatement. Still there arise even from this farrago two quite genuine issues. First, we can

ask whether the spiritual and religio-philosophical view of life and the government of civilisation by its ideas and motives or the rationalistic and external view of life and the satisfaction of the vital being governed by the intellectual and practical reason give the best lead to mankind. And granting the value and power of a spiritual conception of life, we can ask whether the expression given to it by Indian culture is the best possible and the most helpful to the growth of humanity towards its highest level. These are the real questions at issue between this Asiatic or ancient mind and the European or modern intelligence.

The typical occidental mind, which prolongs still the mentality of the eighteenth and nineteenth centuries, has been almost entirely fashioned by the second view; it has grown into the mould of the vitalistic rational idea. Its attitude to life has never been governed by a philosophic conception of existence except during a brief period of Graeco-Roman culture and then only in a small class of thinking and highly cultivated minds; always it is dominated by environmental necessity and the practical reason. It has left behind it too the ages in which spiritual and religious conceptions which invaded it from the East, strove to impose themselves on the vitalistic and rational tendency; it has largely rejected them or thrust them into a corner. Its religion is the religion of life, a religion of earth and of terrestrial humanity, an ideal of intellectual growth, vital efficiency, physical health and enjoyment, a rational social order. This mind confronted by Indian culture is at once repelled, first by its unfamiliarity and strangeness, then by a sense of irrational abnormality and a total difference and often a diametrical opposition of standpoints and finally by an abundance and plethora of unintelligible forms. These forms appear to its eye to teem with the supranatural and therefore, as it thinks, with the false. Even the unnatural is there, a persistent departure from the common norm, from right method and sound device, a frame of things in which everything, to use Mr. Chesterton's expression, is of the wrong shape. The old orthodox Christian point of view might regard this culture as a thing of hell, an abnormal creation of demons; the modern orthodox rationalistic standpoint looks at it as a nightmare not

only irrational, but antirational, a monstrosity, an out-of-date anomaly, at best a coloured fantasia of the oriental past. That is no doubt an extreme attitude, — it is Mr. Archer's, — but incomprehension and distaste are the rule. One continually finds traces of these feelings even in minds which try to understand and sympathise; but to the average occidental content with his first raw natural impressions all is a repellent confusion. Indian philosophy is an incomprehensible, subtly unsubstantial cloud-weaving; Indian religion meets his eye as a mixture of absurd asceticism and an absurder gross, immoral and superstitious polytheism. He sees in Indian art a riot of crudely distorted or conventional forms and an impossible seeking after suggestions of the infinite — whereas all true art should be a beautiful and rational reproduction or fine imaginative representation of the natural and finite. He condemns in Indian society an anachronistic and semi-barbaric survival of old-world and mediaeval ideas and institutions. This view, which has recently undergone some modification and is less loud and confident in expression, but still subsists, is the whole foundation of Mr. Archer's philippic.

This is evident from the nature of all the objections he brings against Indian civilisation. When you strip them of their journalistic rhetoric, you find that they amount simply to this natural antagonism of the rationalised vital and practical man against a culture which subordinates reason to a supra-rational spirituality and life and action to a feeling after something which is greater than life and action. Philosophy and religion are the soul of Indian culture, inseparable from each other and interpenetrative. The whole objective of Indian philosophy, its entire *raison d'être*, is the knowledge of the spirit, the experience of it and the right way to a spiritual existence; its single aim coincides with the highest significance of religion. Indian religion draws all its characteristic value from the spiritual philosophy which illuminates its supreme aspiration and colours even most of what is drawn from an inferior range of religious experience. But what are Mr. Archer's objections, first to Indian philosophy? Well, his first objection simply comes to this that it is too philosophical. His second accusation is that even as that worthless thing, meta-

physical philosophy, it is too metaphysical. His third charge, the most positive and plausible, is that it enervates and kills the personality and the will-power by false notions of pessimism, asceticism, karma and reincarnation. If we take his criticism under each of these heads, we shall see that it is really not a dispassionate intellectual criticism, but the exaggerated expression of a mental dislike and a fundamental difference of temperament and standpoint.

Mr. Archer cannot deny,—the denial would go beyond even his unequalled capacity for affirming absurdities,—that the Indian mind has displayed an unparalleled activity and fruitfulness in philosophical thinking. He cannot deny that a familiarity with metaphysical conceptions and the capacity of discussing with some subtlety a metaphysical problem is much more wide-spread in India than in any other country. Even an ordinary Indian intellect can understand and deal with questions of this kind where an occidental mind of corresponding culture and attainments would be as hopelessly out of its depth as is Mr. Archer in these pages. But he denies that this familiarity and this subtlety are any proof of great mental capacity—"necessarily", he adds, I suppose in order to escape the charge of having suggested that Plato, Spinoza or Berkeley did not show a great mental capacity. Perhaps it is not "necessarily" such a proof; but it does show in one great order of questions, in one large and especially difficult range of the mind's powers and interests a remarkable and unique general development. The European journalist's capacity for discussing with some show of acumen questions of economy and politics or, for that matter, art, literature and drama, is not "necessarily" proof of a great mental capacity; but it does show a great development of the European mind in general, a wide-spread information and normal capacity in these fields of its action. The crudity of his opinions and his treatment of his subjects may sometimes seem a little "barbaric" to an outsider; but the thing itself is a proof that there is a culture, a civilisation, a great intellectual and civic achievement and a sufficient wide-spread interest in the achievement. Mr. Archer has to avoid a similar conclusion in

another subtler and more difficult range about India. He does it by denying that philosophy is of any value; this activity of the Indian mind is for him only an unequalled diligence in knowing the unknowable and thinking about the unthinkable. And why so? Well, because philosophy deals with a region where there is no possible "test of values" and in such a region thought itself, since it is simply unverifiable speculation, can be of little or no value.

There we come to a really interesting and characteristic opposition of standpoints, more, a difference in the very grain of the mind. As stated, it is the sceptical argument of the atheist and agnostic, but after all that is only the extreme logical statement of an attitude common to the average European turn of thinking which is inherently a positivist attitude. Philosophy has been pursued in Europe with great and noble intellectual results by the highest minds, but very much as a pursuit apart from life, a thing high and splendid, but ineffective. It is remarkable that while in India and China philosophy has seized hold on life, has had an enormous practical effect on the civilisation and got into the very bones of current thought and action, it has never at all succeeded in achieving this importance in Europe. In the days of the Stoics and Epicureans it got a grip, but only among the highly cultured; at the present day, too, we have some renewed tendency of the kind. Nietzsche has had his influence, certain French thinkers also in France, the philosophies of James and Bergson have attracted some amount of public interest; but it is a mere nothing compared with the effective power of Asiatic philosophy. The average European draws his guiding views not from the philosophic, but from the positive and practical reason. He does not absolutely disdain philosophy like Mr. Archer, but he considers it, if not a "man-made illusion", yet a rather nebulous, remote and ineffective kind of occupation. He honours the philosophers, but he puts their works on the highest shelf of the library of civilisation, not to be taken down or consulted except by a few minds of an exceptional turn. He admires, but he distrusts them. Plato's idea of philosophers as the right rulers and best directors of society seems to him the most fantastic

and unpractical of notions; the philosopher, precisely because he moves among ideas, must be without any hold on real life. The Indian mind holds on the contrary that the Rishi, the thinker, the seer of spiritual truth is the best guide not only of the religious and moral, but the practical life. The seer, the Rishi is the natural director of society; to the Rishis he attributes the ideals and guiding intuitions of his civilisation. Even today he is very ready to give the name to anyone who can give a spiritual truth which helps his life or a formative idea and inspiration which influences religion, ethics, society, even politics.

This is because the Indian believes that the ultimate truths are truths of the spirit and that truths of the spirit are the most fundamental and most effective truths of our existence, powerfully creative of the inner, salutarily reformative of the outer life. To the European the ultimate truths are more often truths of the ideative intellect, the pure reason; but, whether intellectual or spiritual, they belong to a sphere beyond the ordinary action of the mind, life and body where alone there are any daily verifying "tests of values". These tests can only be given by living experience of outward fact and the positive and practical reason. The rest are speculations and their proper place is in the world of ideas, not in the world of life. That brings us to a difference of standpoint which is the essence of Mr. Archer's second objection. He believes that all philosophy is speculation and guessing; the only verifiable truth, we must suppose, is that of the normal fact, the outward world and our responses to it, truth of physical science and a psychology founded on physical science. He reproaches Indian philosophy for having taken its speculations seriously, for presenting speculation in the guise of dogma, for the "unspiritual" habit which mistakes groping for seeing and guessing for knowing,—in place, I presume, of the very spiritual habit which holds the physically sensible for the only knowable and takes the knowledge of the body for the knowledge of the soul and spirit. He waxes bitterly sarcastic over the idea that philosophic meditation and Yoga are the best way to ascertain the truth of Nature and the constitution of the universe. Mr. Archer's descriptions of Indian philosophy are

a grossly ignorant misrepresentation of its idea and spirit, but in their essence they represent the view inevitably taken by the normal positivist mind of the Occident.

In fact, Indian philosophy abhors mere guessing and speculation. That word is constantly applied by European critics to the thoughts and conclusions of the Upanishads, of the philosophies, of Buddhism; but Indian philosophers would reject it altogether as at all a valid description of their method. If our philosophy admits an ultimate unthinkable and unknowable, it does not concern itself with any positive description or analysis of that supreme Mystery,—the absurdity the rationalist ascribes to it; it concerns itself with whatever is thinkable and knowable to us at the highest term as well as on the lower ranges of our experience. If it has been able to make its conclusions articles of religious faith,—dogmas, as they are here called,—it is because it has been able to base them on an experience verifiable by any man who will take the necessary means and apply the only possible tests. The Indian mind does not admit that the only possible test of values or of reality is the outward scientific, the test of a scrutiny of physical Nature or the everyday normal facts of our surface psychology, which is only a small movement upon vast hidden subconscious and superconscious heights, depths and ranges. What are the tests of these more ordinary or objective values? Evidently, experience, experimental analysis and synthesis, reason, intuition,—for I believe the value of intuition is admitted nowadays by modern philosophy and science. The tests of this other subtler order of truths are the same, experience, experimental analysis and synthesis, reason, intuition. Only, since these things are truths of the soul and spirit, it must necessarily be a psychological and spiritual experience, a psychological and psycho-physical experimentation, analysis and synthesis, a larger intuition which looks into higher realms, realities, possibilities of being, a reason which admits something beyond itself, looks upward to the supra-rational, tries to give as far as may be an account of it to the human intelligence. Yoga, which Mr. Archer invites us so pressingly to abandon, is itself nothing

but a well-tested means of opening up these greater realms of experience.

Mr. Archer and minds of his type cannot be expected to know these things; they are beyond the little narrow range of facts and ideas which is to them the whole arc of knowledge. But even if he knew, it would make no difference to him; he would reject the very thought with scornful impatience, without any degrading of his immense rationalistic superiority by any sort of examination into the possibility of an unfamiliar truth. In this attitude he would have the average positivist mind on his side. To that mind such notions seem in their very nature absurd and incomprehensible,—much worse than Greek and Hebrew, languages which have very respectable and credit-worthy professors; but these are hieroglyphs which can only be upheld as decipherable signs by Indians and Theosophists and mystical thinkers, a disreputable clan. It can understand dogma and speculation about spiritual truth, a priest, a Bible, whether disbelieving them or giving them a conventional acceptance; but profoundest verifiable spiritual truth, firmly ascertainable spiritual values! The idea is foreign to this mentality and sounds to it like jargon. It can understand, even when it dismisses, an authoritative religion, an "I believe because it is rationally impossible"; but a deepest mystery of religion, a highest truth of philosophical thinking, a farthest ultimate discovery of psychological experience, a systematic and ordered experimentation of self-search and self-analysis, a constructive inner possibility of self-perfection, all arriving at the same result, assenting to each other's conclusions, reconciling spirit and reason and the whole psychological nature and its deepest needs,—this great ancient and persistent research and triumph of Indian culture baffles and offends the average positivist mind of the West. It is bewildered by the possession of a knowledge which the West never more than fumbled after and ended by missing. Irritated, perplexed, contemptuous, it refuses to recognise the superiority of such a harmony to its own lesser self-divided culture. For it is accustomed only to a religious seeking and experience which is at war with science and philosophy or oscillates between irrational

belief and a troubled or else a self-confident scepticism. In Europe philosophy has been sometimes the handmaid—not the sister—of religion; but more often it has turned its back on religious belief in hostility or in a disdainful separation. The war between religion and science has been almost the leading phenomenon of European culture. Even philosophy and science have been unable to agree; they too have quarrelled and separated. These powers still coexist in Europe, but they are not a happy family; civil war is their natural atmosphere.

No wonder that the positivist mind to which this seems the natural order of things, should turn from a way of thinking and knowing in which there is a harmony, a consensus, a union between philosophy and religion and a systematised well-tested psychological experience. It is easily moved to escape from the challenge of this alien form of knowledge by readily dismissing Indian psychology as a jungle of self-hypnotic hallucinations, Indian religion as a rank growth of antirational superstitions, Indian philosophy as a remote cloud-land of unsubstantial speculation. It is unfortunate for the peace of mind which this self-satisfied attitude brings with it and for the effect of Mr. Archer's facile and devastating method of criticism that the West too has recently got itself pushed into paths of thinking and discovery which seem dangerously likely to justify all this mass of unpleasant barbarism and to bring Europe herself nearer to so monstrous a way of thinking. It is becoming more and more clear that Indian philosophy has anticipated in its own way most of what has been or is being thought out in metaphysical speculation. One finds even scientific thought repeating very ancient Indian generalisations from the other end of the scale of research. Indian psychology which Mr. Archer dismisses along with Indian cosmology and physiology as baseless classification and ingenious guessing,—it is anything but that, for it is based rigorously on experience,—is justified more and more by all the latest psychological discoveries. The fundamental ideas of Indian religion look perilously near to a conquest by which they will become the prominent thought and sentiment of a new and universal religious mentality and spiritual seeking. Who can say

that the psycho-physiology of Indian Yoga may not be justified if certain lines of "groping and guessing" in the West are pushed a little farther? And even perhaps the Indian cosmological idea that there are other planes of being than this easily sensible kingdom of Matter, may be rehabilitated in a not very distant future? But the positivist mind may yet be of good courage: for its hold is still strong and it has still the claim of intellectual orthodoxy and the prestige of the right of possession; many streams must swell and meet together before it is washed under and a tide of uniting thought sweeps humanity towards the hidden shores of the Spirit.

III

A Rationalistic Critic on Indian Culture – 3

THIS CRITICISM so far is not very formidable; its edge, if it has any apart from the edge of trenchant misrepresentation, turns against the assailant. To have put a high value on philosophy, sought by it the highest secrets of our being, turned an effective philosophic thought on life and called in the thinkers, the men of profoundest spiritual experience, highest ideas, largest available knowledge, to govern and shape society, to have subjected creed and dogma to the test of the philosophic mind and founded religious belief upon spiritual intuition, philosophical thought and psychological experience, are signs, not of barbarism or of a mean and ignorant culture, but marks of the highest possible type of civilisation. There is nothing here that would warrant us in abasing ourselves before the idols of the positivist reason or putting the spirit and aim of Indian culture at all lower than the spirit and aim of Western civilisation whether in its high ancient period of rational enlightenment and the speculative idea or in its modern period of broad and minute scientific thought and strong applied knowledge. Different it is, inferior it is not, but has rather a distinct element of superiority in the unique height of its motive and the spiritual nobility of its endeavour.

It is useful to lay stress on this greatness of spirit and aim, not only because it is of immense importance and the first test of the value of a culture, but because the assailants take advantage of two extraneous circumstances to create a prejudice and confuse the real issues. They have the immense advantage of attacking India when she is prostrate and in the dust and, materially, Indian civilisation seems to have ended in a great defeat and downfall. Strong in this temporary advantage they can afford to show a

superb and generous courage in kicking the surrounding dust and mire with their hooves upon the sick and wounded lioness caught in the nets of the hunters and try to persuade the world that she had never any strength and virtue in her. It is an easy task in this age of the noble culture of Reason and Mammon and Science doing the works of Moloch, when the brazen idol of the great goddess Success is worshipped as she was never before worshipped by cultured human beings. But they have too the yet greater advantage of representing her to the world in a period of the eclipse of her civilisation when after at least two thousand years of the most brilliant and many-sided cultural activity she had for a time lost everything except the memory of her past and her long depressed and obscured but always living and now strongly reviving religious spirit.

I have touched elsewhere on the significance of this failure and this temporary eclipse. I may have to deal with it again at closer quarters, since it has been raised as an objection to the value of Indian culture and Indian spirituality. At present it will be enough to say that culture cannot be judged by material success; still less can spirituality be brought to that touchstone. Philosophic, aesthetic, poetic, intellectual Greece failed and fell while drilled and militarist Rome triumphed and conquered, but no one dreams of crediting for that reason the victorious imperial nation with a greater civilisation and a higher culture. The religious culture of Judaea is not disproved or lessened by the destruction of the Jewish State, any more than it is proved and given greater value by the commercial capacity shown by the Jewish race in their dispersion. But I admit, as ancient Indian thought admitted, that material and economic capacity and prosperity are a necessary, though not the highest or most essential part of the total effort of human civilisation. In that respect India throughout her long period of cultural activity can claim equality with any ancient or mediaeval country. No people before modern times reached a higher splendour of wealth, commercial prosperity, material appointment, social organisation. That is the record of history, of ancient documents, of contemporary witnesses; to deny it is to give evidence of a singular

prepossession and obfuscation of the view, an imaginative, or is it unimaginative, misreading of present actuality into past actuality. The splendour of Asiatic and not least of Indian prosperity, the wealth of Ormuz and of Ind, the "barbaric doors rough with gold", *barbaricae postes squalentes auro*, were once stigmatised by the less opulent West as a sign of barbarism. Circumstances are now strangely reversed; the opulent barbarism and a much less artistic ostentation of wealth are to be found in London, New York and Paris, and it is the nakedness of India and the squalor of her poverty which are flung in her face as evidence of the worthlessness of her culture.

India's ancient and mediaeval political, administrative, military and economic organisation was no mean achievement; the records stand and can be left to contradict the ignorance of the uninstructed and the rhetoric of the journalistic critic or the interested politician. There was no doubt an element of failure and defect, almost unavoidable in the totality of a problem on so large a scale and in the then conditions. But to exaggerate that into a count against her civilisation would be a singular severity of criticism which few civilisations watched to their end could survive. Failure in the end, yes, because of the decline of her culture, but not as a result of its most valuable elements. A later eclipse of the more essential elements of her civilisation is not a disproof of their original value. Indian civilisation must be judged mainly by the culture and greatness of its millenniums, not by the ignorance and weakness of a few centuries. A culture must be judged, first by its essential spirit, then by its best accomplishment and, lastly, by its power of survival, renovation and adaptation to new phases of the permanent needs of the race. In the poverty, confusion and disorganisation of a period of temporary decline, the eye of the hostile witness refuses to see or to recognise the saving soul of good which still keeps this civilisation alive and promises a strong and vivid return to the greatness of its permanent ideal. Its obstinate elastic force of rebound, its old measureless adaptability are again at work; it is no longer even solely on the defence, but boldly aggressive. Not survival alone, but victory and conquest are the promise of its future.

But our critic does not merely deny the lofty aim and greatness of spirit of Indian civilisation, which stand too high to be vulnerable to an assault of this ignorant and prejudiced character. He questions its leading ideas, denies its practical life-value, disparages its fruits, efficacy, character. Has this disparagement any critical value or is it only a temperamental expression of the misunderstanding natural to a widely different view of life and to a diametrically opposite estimate of our nature's highest significances and realities? If we consider the character of the attack and its terms, we shall see that it amounts to no more than a condemnation passed by the positivist mind attached to the normal values of life upon the quite different standards of a culture which looks beyond the ordinary life of man, points to something greater behind it and makes it a passage to something eternal, permanent and infinite. India, we are told, has no spirituality,—a portentous discovery; on the contrary she has succeeded, it would seem, in killing the germs of all sane and virile spirituality. Mr. Archer evidently puts his own sense, a novel and interesting and very occidental sense, on the word. Spirituality has meant hitherto a recognition of something greater than mind and life, the aspiration to a consciousness pure, great, divine beyond our normal mental and vital nature, a surge and rising of the soul in man out of the littleness and bondage of our lower parts towards a greater thing secret within him. That at least is the idea, the experience, which is the very core of Indian thinking. But the rationalist does not believe in the spirit in this sense; life, human will-force and reason are his highest godheads. Spirituality then,—it would have been simpler and more logical to reject the word when the thing on which it rests is denied,—has to be given another sense, some high passion and effort of the emotions, will and reason, directed towards the finite, not towards the infinite, towards things temporary, not towards the eternal, towards perishable life, not towards any greater reality which overpasses and supports the superficial phenomena of life. The thought and suffering which seam and furrow the ideal head of Homer, there, we are told, is the sane and virile spirituality. The calm and compassion of Buddha

victorious over ignorance and suffering, the meditation of the thinker tranced in communion with the Eternal, lifted above the seekings of thought into identity with a supreme light, the rapture of the saint made one by love in the pure heart with the transcendent and universal Love, the will of the Karmayogin raised above egoistic desire and passion into the impersonality of the divine and universal will, these things on which India has set the highest value and which have been the supreme endeavour of her greatest spirits, are not sane, not virile. This, one may be allowed to say, is a very occidental and up to date idea of spirituality. Homer, Shakespeare, Raphael, Spinoza, Kant, Charlemagne, Abraham Lincoln, Lenin, Mussolini, these, shall we suggest, are to figure henceforth not only as great poets and artists or heroes of thought and action, but as our typical heroes and exemplars of spirituality. Not Buddha, not Christ, Chaitanya, St. Francis, Ramakrishna; these are either semi-barbaric Orientals or touched by the feminine insanity of an oriental religion. The impression made on an Indian mind resembles the reaction that a cultured intellectual might feel if he were told that good cooking, good dressing, good engineering, good schoolmastering are the true beauty and their pursuit the right, sane, virile aesthetic cult and literature, architecture, sculpture and painting are only a useless scribbling on paper, an insane hacking of stone and an effeminate daubing of canvas; Vauban, Pestalozzi, Dr. Parr, Vatel and Beau Brummell are then the true heroes of artistic creation and not Da Vinci, Angelo, Sophocles, Dante, Shakespeare or Rodin. Whether Mr. Archer's epithets and his accusations against Indian spirituality stand in the comparison, let the judicious determine. But meanwhile we see the opposition of the standpoints and begin to understand the inwardness of the difference between the West and India.

This forms the gravamen of the charge against the effective value of Indian philosophy, that it turns away from life, nature, vital will and the effort of man upon earth. It denies all value to life; it leads not towards the study of nature, but away from it. It expels all volitional individuality; it preaches the unreality of the

world, detachment from terrestrial interests, the unimportance of the life of the moment compared with the endless chain of past and future existences. It is an enervating metaphysic tangled up with false notions of pessimism, asceticism, karma and reincarnation, all of them ideas fatal to that supreme spiritual thing, volitional individuality. This is a grotesquely exaggerated and false notion of Indian culture and philosophy, got up by presenting one side only of the Indian mind in colours of a sombre emphasis, after a manner which I suppose Mr. Archer has learned from the modern masters of realism. But in substance and spirit it is a fairly correct statement of the notions which the European mind has formed in the past about the character of Indian thought and culture, sometimes in ignorance, sometimes in defiance of the evidence. For a time even it managed to impress some strong shadow of this error on the mind of educated India. It is best to begin by setting right the tones of the picture; that done, we can better judge the opposition of mentality which is at the bottom of the criticism.

To say that Indian philosophy has led away from the study of nature is to state a gross unfact and to ignore the magnificent history of Indian civilisation. If by nature is meant physical Nature, the plain truth is that no nation before the modern epoch carried scientific research so far and with such signal success as India of ancient times. That is a truth which lies on the face of history for all to read; it has been brought forward with great force and much wealth of detail by Indian scholars and scientists of high eminence, but it was already known and acknowledged by European savants who had taken the trouble to make a comparative study in the subject. Not only was India in the first rank in mathematics, astronomy, chemistry, medicine, surgery, all the branches of physical knowledge which were practised in ancient times, but she was, along with the Greeks, the teacher of the Arabs from whom Europe recovered the lost habit of scientific enquiry and got the basis from which modern science started. In many directions India had the priority of discovery,—to take only two striking examples among a multitude, the decimal notation in mathematics or the perception that the earth is a

moving body in astronomy,—*calā prthvī sthirā bhāti*, the earth moves and only appears to be still, said the Indian astronomer many centuries before Galileo. This great development would hardly have been possible in a nation whose thinkers and men of learning were led by its metaphysical tendencies to turn away from the study of nature. A remarkable feature of the Indian mind was a close attention to the things of life, a disposition to observe minutely its salient facts, to systematise and to found in each department of it a science, Shastra, well-founded scheme and rule. That is at least a good beginning of the scientific tendency and not the sign of a culture capable only of unsubstantial metaphysics.

It is perfectly true that Indian science came abruptly to a halt somewhere about the thirteenth century and a period of darkness and inactivity prevented it from proceeding forward or sharing at once in the vast modern development of scientific knowledge. But this was not due to any increase or intolerance of the metaphysical tendency calling the national mind away from physical nature. It was part of a general cessation of new intellectual activity, for philosophy too ceased to develop almost at the same time. The last great original attempts at spiritual philosophy are dated only a century or two later than the names of the last great original scientists. It is true also that Indian metaphysics did not attempt, as modern philosophy has attempted without success, to read the truth of existence principally by the light of the truths of physical Nature. This ancient wisdom founded itself rather upon an inner experimental psychology and a profound psychic science, India's special strength,—but study of mind too and of our inner forces is surely study of nature,—in which her success was greater than in physical knowledge. This she could not but do, since it was the spiritual truth of existence for which she was seeking; nor is any really great and enduring philosophy possible except on this basis. It is true also that the harmony she established in her culture between philosophical truth and truth of psychology and religion was not extended in the same degree to the truth of physical Nature; physical Science had not then arrived at the great universal generalisations which would

have made and are now making that synthesis entirely possible. Nevertheless from the beginning, from as early as the thought of the Vedas, the Indian mind had recognised that the same general laws and powers hold in the spiritual, the psychological and the physical existence. It discovered too the omnipresence of life, affirmed the evolution of the soul in Nature from the vegetable and the animal to the human form, asserted on the basis of philosophic intuition and spiritual and psychological experience many of the truths which modern Science is reaffirming from its own side of the approach to knowledge. These things too were not the results of a barren and empty metaphysics, not the inventions of bovine navel-gazing dreamers.

Equally is it a misrepresentation to say that Indian culture denies all value to life, detaches from terrestrial interests and insists on the unimportance of the life of the moment. To read these European comments one would imagine that in all Indian thought there was nothing but the nihilistic school of Buddhism and the monistic illusionism of Shankara and that all Indian art, literature and social thinking were nothing but the statement of their recoil from the falsehood and vanity of things. It does not follow that because these things are what the average European has heard about India or what most interests or strikes the European scholar in her thought, therefore they are, however great may have been their influence, the whole of Indian thinking. The ancient civilisation of India founded itself very expressly upon four human interests; first, desire and enjoyment, next, material, economic and other aims and needs of the mind and body, thirdly, ethical conduct and the right law of individual and social life, and, lastly spiritual liberation; *kāma, artha, dharma, mokṣa*. The business of culture and social organisation was to lead, to satisfy, to support these things in man and to build some harmony of their forms and motives. Except in very rare cases the satisfaction of the three mundane objects must run before the other; fullness of life must precede the surpassing of life. The debt to the family, the community and the gods could not be scamped; earth must have her due and the relative its play, even if beyond it there was the glory of heaven or the peace of the

Absolute. There was no preaching of a general rush to the cave and the hermitage.

The symmetric character of ancient Indian life and the vivid variety of its literature were inconsistent with any exclusive other-worldly direction. The great mass of Sanskrit literature is a literature of human life; certain philosophic and religious writings are devoted to the withdrawal from it, but even these are not as a rule contemptuous of its value. If the Indian mind gave the highest importance to a spiritual release,—and whatever the positivist mood may say, a spiritual liberation of some kind is the highest possibility of the human spirit,—it was not interested in that alone. It looked equally at ethics, law, politics, society, the sciences, the arts and crafts, everything that appertains to human life. It thought on these things deeply and scrutinisingly and it wrote of them with power and knowledge. What a fine monument of political and administrative genius is the *Sukra-Nīti*, to take one example only, and what a mirror of the practical organisation of a great civilised people! Indian art was not always solely hieratic,—it seemed so only because it is in the temples and cave cathedrals that its greatest work survived; as the old literature testifies, as we see from the Rajput and Mogul paintings, it was devoted as much to the court and the city and to cultural ideas and the life of the people as to the temple and monastery and their motives. Indian education of women as well as of men was more rich and comprehensive and many-sided than any system of education before modern times. The documents which prove these things are now available to anyone who cares to study. It is time that this parrot talk about the unpractical, metaphysical, quietistic, anti-vital character of Indian civilisation should cease and give place to a true and understanding estimate.

But it is perfectly true that Indian culture has always set the highest value on that in man which rises beyond the terrestrial preoccupation; it has held up the goal of a supreme and arduous self-exceeding as the summit of human endeavour. The spiritual life was to its view a nobler thing than the life of external power and enjoyment, the thinker greater than the man of action, the

spiritual man greater than the thinker. The soul that lives in God is more perfect than the soul that lives only in outward mind or only for the claims and joys of thinking and living matter. It is here that the difference comes in between the typical Western and the typical Indian mentality. The West has acquired the religious mind rather than possessed it by nature and it has always worn its acquisition with a certain looseness. India has constantly believed in worlds behind of which the material world is only the antechamber. Always she has seen a self within us greater than the mental and vital self, greater than the ego. Always she has bowed her intellect and heart before a near and present Eternal in which the temporal being exists and to which in man it increasingly turns for transcendence. The sentiment of the Bengali poet, the wonderful singer and rapt devotee of the Divine Mother,—

How rich an estate man lies fallow here!
If this were tilled, a golden crop would spring,—

expresses the real Indian feeling about human life. But it is most attracted by the greater spiritual possibilities man alone of terrestrial beings possesses. The ancient Aryan culture recognised all human possibilities, but put this highest of all and graded life according to a transitional scale in its system of the four classes and the four orders. Buddhism first gave an exaggerated and enormous extension to the ascetic ideal and the monastic impulse, erased the transition and upset the balance. Its victorious system left only two orders, the householder and the ascetic, the monk and the layman, an effect which subsists to the present day. It is this upsetting of the Dharma for which we find it fiercely attacked in the Vishnu Purana under the veil of an analogue, for it weakened in the end the life of society by its tense exaggeration and its hard system of opposites. But Buddhism too had another side, a side turned towards action and creation and gave a new light, a new meaning and a new moral and ideal power to life. Afterwards there came the lofty illusionism of Shankara at the close of the two greatest known millenniums of Indian culture. Life thenceforward was too much depreciated as an unreality or

a relative phenomenon, in the end not worth living, not worth our assent to it and persistence in its motives. But this dogma was not universally accepted, nor admitted without a struggle; Shankara was even denounced by his adversaries as a masked Buddhist. The later Indian mind has been powerfully impressed by his idea of Maya; but popular thought and sentiment was never wholly shaped by it. The religions of devotion which see in life a play or Lila of God and not a half sombre, half glaring illusion defacing the white silence of eternity had a closer growing influence. If they did not counteract, they humanised the austere ascetic ideal. It is only recently that educated India accepted the ideas of English and German scholars, imagined for a time Shankara's Mayavada to be the one highest thing, if not the whole of our philosophy, and put it in a place of exclusive prominence. But against that tendency too there is now a powerful reaction, not towards replacing the spirit without life by life without the spirit, but towards a spiritual possession of mind, life and matter. Still it is true that the ascetic ideal which in the ancient vigour of our culture was the fine spire of life mounting into the eternal existence, became latterly its top-heavy dome and tended under the weight of its bare and imposing sublimity to crush the rest of the edifice.

But here also we should get the right view, away from all exaggeration and false stress. Mr. Archer drags in Karma and Reincarnation into his list of anti-vital Indian notions. But it is preposterous, it is a stupid misunderstanding to speak of reincarnation as a doctrine which preaches the unimportance of the life of the moment compared with the endless chain of past and future existences. The doctrine of reincarnation and Karma tells us that the soul has a past which shaped its present birth and existence; it has a future which our present action is shaping; our past has taken and our future will take the form of recurring terrestrial births and Karma, our own action, is the power which by its continuity and development as a subjective and objective force determines the whole nature and eventuality of these repeated existences. There is nothing here to deprecate the importance of the present life. On the contrary the doctrine

gives it immense vistas and enormously enhances the value of effort and action. The nature of the present act is of an incalculable importance because it determines not only our immediate but our subsequent future. There will be found too insistently pervading Indian literature and deeply settled in the mind of the people the idea of a whole-hearted concentrated present action and energy, tapasya, as a miraculous all-powerful force for the acquisition of our desires, whether the material or the spiritual desires of the human will. No doubt, our present life loses the exclusive importance which we give to it when we regard it only as an ephemeral moment in Time never to be repeated, our one sole opportunity, without any after-existence beyond it. But a narrow exaggerated insistence on the present shuts up the human soul in the prison of the moment: it may give a feverish intensity to action, but it is inimical to calm and joy and greatness of the spirit. No doubt, too, the idea that our present sufferings are the results of our own past action, imparts a calm, a resignation, an acquiescence to the Indian mind which the restless Western intelligence finds it difficult to understand or tolerate. This may degenerate in a time of great national weakness, depression and misfortune, into a quietistic fatalism that may extinguish the fire of reparative endeavour. But that is not its inevitable turn, nor is it the turn given to it in the records of the more vigorous past of our culture. The note there is of action, of tapasya. There is too another turn given to this belief which increased with time, the Buddhistic dogma of the succession of rebirths as a chain of Karma from which the soul must escape into the eternal silence. This notion has strongly affected Hinduism; but whatever is depressing in it, belongs not properly to the doctrine of rebirth but to other elements stigmatised as an ascetic pessimism by the vitalistic thought of Europe.

Pessimism is not peculiar to the Indian mind: it has been an element in the thought of all developed civilisations. It is the sign of a culture already old, the fruit of a mind which has lived much, experienced much, sounded life and found it full of suffering, sounded joy and achievement and found that all is vanity and vexation of spirit and there is nothing new under the sun or, if

there is, its novelty is but of a day. Pessimism has been as rampant in Europe as in India and it is certainly a singular thing to find the materialist of all people bringing against Indian spirituality this accusation of lowering the values of existence. For what can be more depressing than the materialistic view of the quite physical and ephemeral nature of human life? There is nothing in the most ascetic notes of the Indian mind like the black gloom of certain kinds of European pessimism, a city of dreadful night without joy here or hope beyond, and nothing like the sad and shrinking attitude before death and the dissolution of the body which pervades Western literature. The note of ascetic pessimism often found in Christianity is a distinctly Western note; for it is absent in Christ's teachings. This mediaeval religion with its cross, its salvation by suffering, its devil-ridden and flesh-ridden world and the flames of eternal hell waiting for man beyond the grave has a character of pain and terror alien to the Indian mind, to which indeed religious terror is a stranger. The suffering of the world is there, but it fades into a bliss of spiritual peace or ecstasy beyond the sorrow line. Buddha's teaching laid heavy stress on the sorrow and impermanence of things, but the Buddhist Nirvana won by the heroic spirit of moral self-conquest and calm wisdom is a state of ineffable calm and joy, open not only to a few like the Christian heavens, but to all, and very different from the blank cessation which is the mechanical release of our pain and struggle, the sorry Nirvana of the Western pessimist, the materialist's brute flat end of all things. Even illusionism preached, not a gospel of sorrow, but the final unreality of joy and grief and the whole world-existence. It admits the practical validity of life and allows its values to those who dwell in the Ignorance. And like all Indian asceticism it places before man the possibility of a great effort, a luminous concentration of knowledge, a mighty urge of the will by which he can rise to an absolute peace or an absolute bliss. A not ignoble pessimism there has been about man's normal life as it is, a profound sense of its imperfection, a disgust of its futile obscurity, smallness and ignorance; but an unconquerable optimism as regards his spiritual possibility was the other side of this mood. If it did

not believe in the ideal of an immense material progress of the race or a perfection of the normal man with earth as its field, it believed in a sure spiritual progress for every individual and an ultimate perfection lifted above subjection to the shocks of life. And this pessimism with regard to life is not the sole note of the Indian religious mind; its most popular forms accept life as a game of God and see beyond our present conditions for every human being the eternal nearness to the Divine. A luminous ascent into godhead was always held to be a consummation well within man's grasp. That can hardly be called a depressing or pessimistic theory of existence.

There can be no great and complete culture without some element of asceticism in it; for asceticism means the self-denial and self-conquest by which man represses his lower impulses and rises to greater heights of his nature. Indian asceticism is not a mournful gospel of sorrow or a painful mortification of the flesh in morbid penance, but a noble effort towards a higher joy and an absolute possession of the spirit. A great joy of self-conquest, a still joy of inner peace and the forceful joy of a supreme self-exceeding are at the heart of its experience. It is only a mind besotted with the flesh or too enamoured of external life and its restless effort and inconstant satisfactions that can deny the nobility or idealistic loftiness of the ascetic endeavour. But there are the exaggerations and deflections that all ideals undergo. Those which are the most difficult to humanity, suffer from them most, and asceticism may become a fanatic self-torture, a crude repression of the nature, a tired flight from existence or an indolent avoidance of the trouble of life and a weak recoil from the effort demanded of our manhood. Practised not by the comparatively few who are called to it, but preached in its extreme form to all and adopted by unfit thousands, its values may be debased, counterfeits may abound and the vital force of the community lose its elasticity and its forward spring. It would be idle to pretend that such defects and untoward results have been absent in India. I do not accept the ascetic ideal as the final solution of the problem of human existence; but even its exaggerations have a nobler spirit behind them than the vitalistic

exaggerations which are the opposite defect of Western culture.

After all asceticism and illusionism are minor issues. The point to be pressed is that Indian spirituality in its greatest eras and in its inmost significance has not been a tired quietism or a conventional monasticism, but a high effort of the human spirit to rise beyond the life of desire and vital satisfaction and arrive at an acme of spiritual calm, greatness, strength, illumination, divine realisation, settled peace and bliss. The question between the culture of India and the vehement secular activism of the modern mind is whether such an endeavour is or is not essential to man's highest perfection. And if it is, then the other question arises whether it is to be only an exceptional force confined to a few rare spirits or can be made the main inspiring motive-power of a great and complete human civilisation.

IV

A Rationalistic Critic on Indian Culture—4

ARIGHT judgment of the life-value of Indian philosophy is intimately bound up with a right appreciation of the life-value of Indian religion; religion and philosophy are too intimately one in this culture to be divided from each other. Indian philosophy is not a purely rational gymnastic of speculative logic in the air, an ultra-subtle process of thought-spinning and word-spinning like the greater part of philosophy in Europe; it is the organised intellectual theory of the intuitive ordering perception of all that is the soul, the thought, the dynamic truth, the heart of feeling and power of Indian religion. Indian religion is Indian spiritual philosophy put into action and experience. Whatever in the religious thought and practice of that vast, rich, thousand-sided, infinitely pliable, yet very firmly structured system we call Hinduism, does not in intention come under this description,—whatever its practice,—is either social framework or projection of ritual buttresses or survival of old supports and additions. Or else it is an excrescence and growth of corruption, a degradation of its truth and meaning in the vulgar mind, part of the debased mixtures that overtake all religious thinking and practice. Or, in some instances, it is dead habit contracted in periods of fossilisation or ill-assimilated extraneous matter gathered into this giant body. The inner principle of Hinduism, the most tolerant and receptive of religious systems, is not sharply exclusive like the religious spirit of Christianity or Islam; as far as that could be without loss of its own powerful idiosyncrasy and law of being, it has been synthetic, acquisitive, inclusive. Always it has taken in from every side and trusted to the power of assimilation that burns in its spiritual heart and in the white heat of its flaming centre to turn even the most

unpromising material into forms for its spirit.

But before we turn to see what it is that so fiercely irritates and exasperates our hostile Western critic in Indian religious philosophy, it is as well to consider what he has to say about other sides of this ancient, dateless and still vigorously living, growing, all-assimilating Hinduism. For he has a great deal to say and it is unsparing and without measure. There is not the intemperate drunkenness of denunciation and vomit of false witness, hatred, uncharitableness and all things degrading and unspiritual and unclean that are the mark of a certain type of "Christian literature" on the subject,—for example, the superlative specimen of this noxious compound which Sir John Woodroffe has cited from the pages of Mr. Harold Begbie, "virile" perhaps if violence is virile, but certainly not sane. But still it is a mass of unsparing condemnation, exaggerated where it has any foundation at all and serenely illogical in its blithe joy of deliberate misrepresentation. Still, even from this crude mass it is possible to disengage the salient and typical antipathies that recommend it to the uncritical and even to many critical minds, and it is these alone that it is useful to discover.

The total irrationality of Hinduism is the main theme of the attack. Mr. Archer does casually admit a philosophical, and one might therefore suppose a rational element in the religion of India, but he disparages and dismisses as false and positively harmful the governing ideas of this religious philosophy as he understands or imagines he understands them. He explains the pervading irrational character of Hindu religion by the allegation that the Indian people have always gravitated towards the form rather than the substance and towards the letter rather than the spirit. One would have supposed that this kind of gravitation is a fairly universal feature of the human mind, not only in religion, but in society, politics, art, literature, even in science. In every conceivable human activity a cult of the form and forgetfulness of the spirit, a turn towards convention, externalism, unthinking dogma has been the common drift of the human mind from China to Peru and it does not skip Europe on its way. And Europe where men have constantly fought, killed,

burned, tortured, imprisoned, persecuted in every way imaginable by human stupidity and cruelty for the sake of dogmas, words, rites and forms of church government, Europe where these things have done duty for spirituality and religion, has hardly a record which would entitle it to cast this reproach in the face of the East. But, we are told, this gravitation afflicts the Indian religion more than any other creed. Higher Hinduism can be scarcely said to exist except in certain small reforming sects and current Hinduism, the popular religion, is the cult of a monstrous folk-lore oppressive and paralysing to the imagination,— although here again one would think that if anything an excess rather than a paralysis of the creative imagination might be charged against the Indian mind. Animism and magic are the prevailing characteristics. The Indian people has displayed a genius for obfuscating reason and formalising, materialising and degrading religion. If India has possessed great thinkers, she has not extracted from their thoughts a rational and ennobling religion: the devotion of the Spanish or the Russian peasant is rational and enlightened by comparison. Irrationalism, anti-rationalism,— that in this laboured and overcharged accusation is the constant cry; it is the keynote of the Archer tune.

The phenomenon that has astonished and disgusted the mind of the critic is the obstinate survival in India of the old religious spirit and large antique religious types unsubmerged by the flood of modernism and its devastating utilitarian free thought. India, he tells us, still clings to what not only the Western world, but China and Japan have outgrown for ages. The religion is a superstition full of performances of piety repulsive to the free enlightened secular mind of the modern man. Its daily practices put it far outside the pale of civilisation. Perhaps, if it had confined its practice decorously to church attendance on Sundays and to marriage and funeral services and grace before meat, it might have been admitted as human and tolerable! As it is, it is the great anachronism of the modern world; it has not been cleansed for thirty centuries; it is paganism, it is a wholly unfiltered paganism; its tendency towards pollution rather than purification marks out its place as incomparably the lowest in

the scale of world religions. An ingenious remedy is proposed. Christianity destroyed Paganism in Europe; therefore, since any immediate or very rapid triumph of sceptical free-thought would be too happily abrupt a transition to be quite feasible, we unenlightened, polluted, impure Hindus are advised to take up for a time with Christianity, poor irrational thing that it is, dark and deformed though it looks in the ample light of the positivist reason, because Christianity and especially Protestant Christianity will be at least a good preparatory step towards the noble freedom and stainless purities of atheism and agnosticism. But if even this little cannot be hoped for in spite of numerous famine conversions, at any rate Hinduism must somehow or other get itself filtered, and until that hygienic operation has been executed, India must be denied fellowship on equal terms with the civilised nations.

Incidentally, to support this charge of irrationalism and its companion charge of Paganism, we find a third and more damaging count brought against us and our religious culture, an alleged want of all moral worth and ethical substance. There is now an increasing perception, even in Europe, that reason is not the last word of human mind, not quite the one and only sovereign way to truth and certainly not the sole arbiter of religious and spiritual truth. The accusation of paganism too does not settle the question, since plenty of cultivated minds are well able to see that there were many great, true and beautiful things in the ancient religions that were lumped together by Christian ignorance under that inappropriate nickname. Nor has the world been entirely a gainer by losing these high ancient forms and motives. But whatever the actual practice of men,—and in this respect the normal human being is a singular mixture of the sincere but quite ineffective, the just respectable, would-be ethical man and the self-deceiving or semi-hypocritical Pharisee,—one can always appeal with force to a moralistic prejudice. All religions raise high the flag of morality and, whether religious or secular-minded, all but the antinomian, the rebel and the cynic, profess to follow or at least to admit that standard in their lives. This accusation is therefore about the most prejudicial charge

that can be brought against any religion. The self-constituted prosecuting judge whose diatribe we are examining brings it without scruple and without measure. He has discovered that Hinduism is not an ennobling or even a morally helpful religion; if it has talked much of righteousness, it has never claimed moral teaching as one of its functions. A religion that can talk much of righteousness without performing the function of moral teaching, sounds rather like a square which can make no claim to be a quadrilateral; but let that pass. If the Hindu is comparatively free from the grosser Western vices,—as yet only, and only until he enters “the pale of civilisation” by adopting Christianity or otherwise,—it is not because there is any ethical strain in his character; it is because these vices do not come his way. His social system founded on the barbarous idea of the Dharma, of the divine and the human, the universal and the individual, the ethical and the social law, and supported on it at every point, has stupidly neglected to supply him with the opportunities of departing from it so liberally provided by Western civilisation! And yet the whole character of Hinduism, which is the character of the people, indicates, we are calmly told, a melancholy proclivity towards whatever is monstrous and unwholesome! On that highest note of unmeasured denunciation we may leave Mr. Archer’s monstrous and unwholesome dance of disparagement and turn to disengage the temperamental sources of his dislike and anger.

Two things especially distinguish the normal European mind,—for we must leave aside some great souls and some great thinkers or some moments or epochs of abnormal religiosity and look at the dominant strain. Its two significant characters are the cult of the inquiring, defining, effective, practical reason and the cult of life. The great high tides of European civilisation, Greek culture, the Roman world before Constantine, the Renascence, the modern age with its two colossal idols, Industrialism and physical Science, have come to the West on the strong ascending urge of this double force. Whenever the tide of these powers has ebbed, the European mind has entered into much confusion, darkness and weakness. Christianity failed to spiritualise

Europe, whatever it may have done towards humanising it in certain ethical directions, because it ran counter to these two master instincts; it denied the supremacy of the reason and put its anathema on a satisfied or strenuous fullness of life. But in Asia there has been neither this predominance of reason and the life-cult nor any incompatibility of these two powers with the religious spirit. The great ages of Asia, the strong culminations of her civilisation and culture,—in India the high Vedic beginning, the grand spiritual stir of the Upanishads, the wide flood of Buddhism, Vedanta, Sankhya, the Puranic and Tantric religions, the flowering of Vaishnavism and Shaivism in the southern kingdoms—have come in on a surge of spiritual light and a massive or intense climbing of the religious or the religio-philosophic mind to its own heights, its noblest realities, its largest riches of vision and experience. It was in such periods that intellect, thought, poetry, the arts, the material life flowered into splendour. The ebbing of spirituality brought in always, on the contrary, the weakness of these other powers, periods of fossilisation or at least depression of the power of life, tracts of decline, even beginnings of decay. This is a clue to which we have to hold if we would understand the great lines of divergence between the East and the West.

Towards the spirit if not all the way to it man must rise or he misses his upward curve of strength; but there are different ways of approach to its secret forces. Europe, it would seem, must go through the life and the reason and find spiritual truth by their means as a crown and a revelation; she cannot at once take the kingdom of heaven by violence, as the saying of Christ would have men do. The attempt confuses and obscures her reason, is combated by her life instincts and leads to revolt, negation, a return to her own law of nature. But Asia or at any rate India lives naturally by a spiritual influx from above; that alone brings with it a spiritual evocation of her higher powers of mind and life. The two continents are two sides of the integral orb of humanity and until they meet and fuse, each must move to whatever progress or culmination the spirit in humanity seeks, by the law of its being, its own proper Dharma. A one-sided

world would have been the poorer for its uniformity and the monotone of a single culture; there is a need of divergent lines of advance until we can raise our heads into that infinity of the spirit in which there is a light broad enough to draw together and reconcile all highest ways of thinking, feeling and living. That is a truth which the violent Indian assailant of a materialistic Europe or the contemptuous enemy or cold disparager of Asiatic or Indian culture agree to ignore. There is here no real question between barbarism and civilisation, for all masses of men are barbarians labouring to civilise themselves. There is only one of the dynamic differences necessary for the completeness of the growing orb of human culture.

Meanwhile the divergence unfortunately gives rise to a constant warring opposition of outlooks in religion and in most other matters, and the opposition brings with it more or less of an incapacity for mutual understanding and even a positive enmity or dislike. The emphasis of the Western mind is on life, the outer life above all, the things that are grasped, visible, tangible. The inner life is taken only as an intelligent reflection of the outer world, with the reason for a firm putter of things into shape, an intelligent critic, builder, refiner of the external materials offered by Nature. The present use of living, to be wholly in this life and for this life, is all the preoccupation of Europe. The present life of the individual and the continuous physical existence and developing mind and knowledge of humanity make up her one absorbing interest. Even from religion the West is apt to demand that it shall subordinate its aim or its effect to this utility of the immediate visible world. The Greek and the Roman looked on religious cult as a sanction for the life of the "polis" or a force for the just firmness and stability of the State. The Middle Ages when the Christian idea was at its height were an interregnum; it was a period during which the Western mind was trying to assimilate in its emotion and intelligence an oriental ideal. But it never succeeded in firmly living it and had eventually to throw it aside or keep it only for a verbal homage. The present moment is in the same way for Asia an interregnum dominated by an attempt to assimilate in its intellect and life in

spite of a rebellious soul and temperament the Western outlook and its earth-bound ideal. And it may be safely predicted that Asia too will not succeed in living out this alien law firmly or for a long time. But in Europe even the Christian idea, marked in its purity by the emphasis of its introspective tendency and an uncompromising other-worldliness, had to compromise with the demands of the occidental temperament and in doing that it lost its own inner kingdom. The genuine temperament of the West triumphed and in an increasing degree rationalised, secularised and almost annihilated the religious spirit. Religion became more and more a pale and ever thinning shadow pushed aside into a small corner of the life and a still smaller corner of the nature and awaiting sentence of death or exile, while outside the doors of the vanquished Church marched on their victorious way the triumphant secular pomps of the outward life and the positive reason and materialistic Science.

The tendency to secularism is a necessary consequence of the cult of life and reason divorced from their inmost inlook. Ancient Europe did not separate religion and life; but that was because it had no need for the separation. Its religion, once it got rid of the oriental element of the mysteries, was a secular institution which did not look beyond a certain supraphysical sanction and convenient aid to the government of this life. And even then the tendency was to philosophise and reason away the relics of the original religious spirit, to exile the little shadow that remained of the brooding wings of a suprarational mystery and to get into the clear sunlight of the logical and practical reason. But modern Europe went farther and to the very end of this way. The more effectually to shake off the obsession of the Christian idea, which like all oriental religious thought claims to make religion commensurate with life and, against whatever obstacles may be opposed to it by the unregenerate vital nature of the animal man, spiritualise the whole being and its action, modern Europe separated religion from life, from philosophy, from art and science, from politics, from the greater part of social action and social existence. And it secularised and rationalised too the ethical demand so that it might stand

in itself on its own basis and have no need of any aid from religious sanction or mystic insistence. At the end of this turn is an antinomian tendency, constantly recurring in the life-history of Europe and now again in evidence. This force seeks to annul ethics also, not by rising above it into the absolute purity of the spirit, as mystic experience claims to do, but by breaking out of its barriers below into an exultant freedom of the vital play. In this evolution religion was left aside, an impoverished system of belief and ceremony to which one might or might not subscribe with very little difference to the march of the human mind and life. Its penetrating and colouring power had been reduced to a faint minimum; a superficial pigmentation of dogma, sentiment and emotion was all that survived this drastic process.

Even the poor little corner that was still conceded to it, intellectualism insisted on flooding as much as possible with the light of reason. The trend has been to reduce, not only the infra-rational, but equally the suprarational refuges of the religious spirit. The old pagan polytheistic symbolism had clothed with its beautiful figures the ancient idea of a divine presence and supraphysical life and Power in all Nature and in every particle of life and matter and in all animal existence and in all the mental action of man; but this idea, which to the secularist reason is only an intellectualised animism, had already been ruthlessly swept aside. The Divinity had abandoned the earth and lived far aloof and remote in other worlds, in a celestial heaven of saints and immortal spirits. But why should there be any other worlds? I admit, cried the progressing intellect, only this material world to which our reason and senses bear witness. A vague bleak abstraction of spiritual existence without any living habitation, without any means of dynamic nearness was left to satisfy the wintry remnants of the old spiritual sense or the old fantastic illusion. A blank and tepid Theism remained or a rationalised Christianity without either the name of Christ or his presence. Or why should that even be allowed by the critical light of the intelligence? A Reason or Power, called God for want of a better name, represented by the moral and physical Law in the material universe, is quite sufficient for any rational mind,

—and so we get to Deism, to a vacant intellectual formula. Or why should there be any God at all? The reason and the senses by themselves give no witness to God; at best they can make of Him only a plausible hypothesis. But there is no need of an unsubstantial hypothesis, since Nature is enough and the sole thing of which we have knowledge. Thus by an inevitable process we reach the atheistic or agnostic cult of secularism, the acme of denial, the zenith of the positive intelligence. And there reason and life may henceforward take their foundation and reign well satisfied over a conquered world,—if only that inconvenient veiled ambiguous infinite Something behind will leave them alone for the future!

A temperament, an outlook of this kind must necessarily be impatient of any such thing as an earnest straining after the suprarational and the infinite. It may tolerate some moderate play of these fine hallucinations as an innocent indulgence of the speculative mind or the artistic imagination, provided it is not too serious and does not intrude upon life. But asceticism and other-worldliness are abhorrent to its temperament and fatal to its outlook. Life is a thing to be possessed and enjoyed rationally or forcefully according to our power, but this earthly life, the one thing we know, our only province. At most a moderate intellectual and ethical asceticism is permissible, the simple life, plain living, high thinking; but an ecstatic spiritual asceticism is an offence to the reason, almost a crime. Pessimism of the vitalistic kind may be allowed its mood or its hour; for it admits that life is an evil that has to be lived and does not cut at its roots. But the obvious right standpoint is to take life as it is and make the most of it, either practically for the best ordering of its mixed good and evil or ideally with some hope of a relative perfection. If spirituality is to have any meaning, it can only signify the aim or the high labour of a lofty intelligence, rational will, limited beauty and moral good which will try to make the best of this life that is, but not vainly look beyond to some unhuman, unattainable, infinite or absolute satisfaction. If religion is to survive, let its function be to serve this kind of spiritual aim, to govern conduct, to give beauty and purity to our living, but let it

minister only to this sane and virile spirituality; let it keep within the bounds of the practical reason and an earthly intelligence. This description no doubt isolates the main strands and ignores departures to one side or the other; and in all human nature there must be departures, often of an extreme kind. But it would not, I think, be an unfair or exaggerated description of the persistent ground and characteristic turn of the Western temperament and its outlook and the normal poise of its intelligence. This is its self-fulfilled static poise before it proceeds to that deflection or that self-exceeding to which man is inevitably moved when he reaches the acme of his normal nature. For he harbours a power in Nature that must either grow or else stagnate and cease and disintegrate, and until he has found all himself, there is for him no static abiding and no permanent home for his spirit.

Now when this Western mind is confronted with the still surviving force of Indian religion, thought, culture, it finds that all its standards are denied, exceeded or belittled; all that it honours is given a second place, all that it has rejected is still held in honour. Here is a philosophy which founds itself on the immediate reality of the Infinite, the pressing claim of the Absolute. And this is not as a thing to speculate about, but as a real presence and a constant Power which demands the soul of man and calls it. Here is a mentality which sees the Divine in Nature and man and animal and inanimate thing, God at the beginning, God in the middle, God at the end, God everywhere. And all this is not a permissible poetical play of the imagination that need not be taken too seriously by life, but is put forward as a thing to be lived, realised, put at the back even of outward action, turned into stuff of thought, feeling and conduct! And whole disciplines are systematised for this purpose, disciplines which men still practise! And whole lives are given up to this pursuit of the supreme Person, the universal Godhead, the One, the Absolute, the Infinite! And to pursue this immaterial aim men are still content to abandon the outward life and society and home and family and their most cherished pursuits and all that has to a rational mind a substantial and ascertainable value! Here is a country which is still heavily coloured with the

ochre tint of the garb of the Sannyasin, where the Beyond is still preached as a truth and men have a living belief in other worlds and reincarnation and a whole army of antique ideas whose truth is quite unverifiable by the instruments of physical Science. Here the experiences of Yoga are held to be as true or more true than the experiments of the laboratory. Is this not a thinking of things evidently unthinkable since the rational Western mind has ceased to think about them? Is it not an attempt to know things evidently unknowable since the modern mind has abandoned all attempt to know them? There is amongst these irrational half-savages an endeavour even to make this unreal thing the highest flight of life, its very goal, and a governing force, a shaping power in art and culture and conduct. But art and culture and conduct are things which, this rational mind tells us, Indian spirituality and religion ought logically not to touch at all; for they belong to the realm of the finite and can only be founded on the intellectual reason and the practical environment and the truths and suggestions of physical Nature. There in its native form is the apparent gulf between the two mentalities and it looks unbridgeable. Or rather the Indian mind can understand well enough, even when it does not share, the positivist turn of the occidental intelligence; but it is itself to the latter a thing, if not damnable, at least abnormal and unintelligible.

The effects of the Indian religio-philosophical standpoint on life are to the occidental critic still more intolerable. If his reason was already offended by this suprarational and to him antirational urge, it is the strongest instincts of his temperament that are now violently shocked by their own direct contrasts and opposites. Life, the thing on which he puts an entire and unquestioning value, is questioned here. It is belittled and discouraged by the extremest consequences of one side of the Indian outlook or inlook and is nowhere accepted as it is for its own sake. Asceticism ranges rampant, is at the head of things, casts its shadow on the vital instincts and calls man to exceed the life of the body and even the life of the mental will and intelligence. The Western mind lays an enormous stress upon force of personality, upon the individual will, upon the apparent man and the desires

and demands of his nature. But here is an opposing stress on a high growth towards impersonality, on the widening of the individual into the universal will, on an increasing or breaking beyond the apparent man and his limits. The flowering of the mental and vital ego or at most its subservience to the larger ego of the community is the West's cultural ideal. But here the ego is regarded as the chief obstacle to the soul's perfection and its place is proposed to be taken not by the concrete communal ego, but by something inward, abstract, transcendental, something supramental, supraphysical, absolutely real. The Western temperament is rajasic, kinetic, pragmatic, active; thought for it turns always to action and has little value except for the sake of action or else for a fine satisfaction of the mind's play and vigour. But here the type proposed for admiration is the self-possessed sattvic man for whom calm thought, spiritual knowledge and the inner life are the things of the greatest importance and action is chiefly of consequence not for its own sake, not for its rewards and fruits, but for its effects on the growth of the inner nature. Here too is a disconcerting quietism which looks forward to the cessation or Nirvana of all thought and action in a perpetual light and peace. It is not surprising that a critic with an unreleased occidental mind should look upon these contrasts with much dissatisfaction, a recoil of antipathy, an almost ferocious repugnance.

But at any rate these things, however remote they may seem to his understanding, contain something that is lofty and noble. He can disparage them as false, antirational and depressing, but not denounce them as evil and ignoble. Or he can do this only on the strength of such misrepresentations as some of those we have noted in Mr. Archer's more irresponsible strictures. These things may be signs of an antique or an antiquated mind, but are certainly not the fruits of a barbaric culture. But when he surveys the forms of the religion which they enlighten and animate, it does look to him as if he was in the presence of a pure barbarism, a savage ignorant muddle. For here is an abundance of everything of which he has so long been steadily emptying religion in his own culture, well content to call that emptiness

reformation, enlightenment and the rational truth of things. He sees a gigantic polytheism, a superabundance of what seems to his intelligence rank superstition, a limitless readiness of belief in things that are to him without significance or incredible. The Hindu is popularly credited with thirty crores and more of gods, as many inhabitants for all the many heavens as there are men in this single earthly peninsula India; and he has no objection to adding, if need be, to this mighty multitude. Here are temples, images, a priesthood, a mass of unintelligible rites and ceremonies, the daily repetition of Sanskrit mantras and prayers, some of them of a prehistoric creation, a belief in all kinds of supraphysical beings and forces, saints, gurus, holy days, vows, offerings, sacrifice, a constant reference of life to powers and influences of which there can be no physical evidence instead of a rational scientific dependence on the material laws which alone govern the existence of mortal creatures. It is to him an unintelligible chaos; it is animism; it is a monstrous folk-lore. The meaning which Indian thought puts upon these things, their spiritual sense, escapes him altogether or it leaves him incredulous or else strikes his mind as a vain and mad symbolism subtle, useless, futile. And not only is the cult and belief of this people antiquated and mediaeval in kind, but it is not kept in its proper place. Instead of putting religion into an unobtrusive and ineffective corner, the Indian mind has the pretension, the preposterous pretension which rational man has outgrown for ever, of filling with it the whole of life.

It would be difficult to convince the too positive average European intelligence which has "outgrown" the religious mentality or is only struggling back towards it after a not yet liquidated bankruptcy of rationalistic materialism, that there is any profound truth or meaning in these Indian religious forms. It has been well said that they are rhythms of the spirit; but one who misses the spirit must necessarily miss too the connection of the spirit and the rhythm. The gods of this worship are, as every Indian knows, potent names, divine forms, dynamic personalities, living aspects of the one Infinite. Each Godhead is a form or derivation or dependent power of the supreme Trinity,

each Goddess a form of the universal Energy, Conscious-Force or Shakti. But to the logical European mind monotheism, polytheism, pantheism are irreconcilable warring dogmas; oneness, many-ness, all-ness are not and cannot be different but concordant aspects of the eternal Infinite. A belief in one Divine Being superior to cosmos who is all cosmos and who lives in many forms of godhead, is a hotch-potch, mush, confusion of ideas; for synthesis, intuitive vision, inner experience are not the forte of this strongly external, analytic and logical mind. The image to the Hindu is a physical symbol and support of the supraphysical; it is a basis for the meeting between the embodied mind and sense of man and the supraphysical power, force or presence which he worships and with which he wishes to communicate. But the average European has small faith in disembodied entities and, if they are at all, he would put them away into a category apart, another unconnected world, a separate existence. A nexus between the physical and supraphysical is to his view a meaningless subtlety admissible only in imaginative poetry and romance.

The rites, ceremonies, system of cult and worship of Hinduism can only be understood if we remember its fundamental character. It is in the first place a non-dogmatic inclusive religion and would have taken even Islam and Christianity into itself, if they had tolerated the process. All that it has met on its way it has taken into itself, content if it could put its forms into some valid relation with the truth of the supraphysical worlds and the truth of the Infinite. Again it has always known in its heart that religion, if it is to be a reality for the mass of men and not only for a few saints and thinkers, must address its appeal to the whole of our being, not only to the suprarational and the rational parts, but to all the others. The imagination, the emotions, the aesthetic sense, even the very instincts of the half subconscious parts must be taken into the influence. Religion must lead man towards the suprarational, the spiritual truth and it must take the aid of the illumined reason on the way, but it cannot afford to neglect to call Godwards the rest of our complex nature. And it must take too each man where he stands and spiritualise him through what he can feel and not at once force

on him something which he cannot yet grasp as a true and living power. That is the sense and aim of all those parts of Hinduism which are specially stigmatised as irrational or antirational by the positivist intelligence. But the European mind has failed to understand this plain necessity or has despised it. It insists on "purifying" religion, by the reason and not by the spirit, on "reforming" it, by the reason and not by the spirit. And we have seen what were the results of this kind of purification and reformation in Europe. The infallible outcome of that ignorant doctoring has been first to impoverish and then slowly to kill religion; the patient has fallen a victim to the treatment, while he might well have survived the disease!

The accusation of a want of ethical content is almost monstrously false,—it is the direct opposite of the truth; but we must look for its explanation in some kind of characteristic misunderstanding; for it is not new. Hindu thought and literature might almost be accused of a tyrannously pervading ethical obsession; everywhere the ethical note recurs. The idea of the Dharma is, next to the idea of the Infinite, its major chord; Dharma, next to spirit, is its foundation of life. There is no ethical idea which it has not stressed, put in its most ideal and imperative form, enforced by teaching, injunction, parable, artistic creation, formative examples. Truth, honour, loyalty, fidelity, courage, chastity, love, long-suffering, self-sacrifice, harmlessness, forgiveness, compassion, benevolence, beneficence are its common themes, are in its view the very stuff of a right human life, the essence of man's dharma. Buddhism with its high and noble ethics, Jainism with its austere ideal of self-conquest, Hinduism with its magnificent examples of all sides of the Dharma are not inferior in ethical teaching and practice to any religion or system, but rather take the highest rank and have had the strongest effective force. For the practice of these virtues in older times there is abundant internal and foreign evidence. A considerable stamp of them still remains in spite of much degeneracy even though there has been some depression of the manlier qualities which only flourish in their fullest power on the soil of freedom. The legend to the contrary began in the minds

of English scholars with a Christian bias who were misled by the stress which Indian philosophy lays on knowledge rather than works as the means of salvation. For they did not note or could not grasp the meaning of the rule well-known to all Indian spiritual seekers that a pure sattvic mind and life are presupposed as the first step towards the divine knowledge—the doers of evil find me not, says the Gita. And they were unable to realise that knowledge of the truth means for Indian thought, not intellectual assent or recognition, but a new consciousness and a life according to the truth of the Spirit. Morality is for the Western mind mostly a thing of outward conduct; but conduct for the Indian mind is only one means of expression and sign of a soul-state. Hinduism only incidentally strings together a number of commandments for observance, a table of moral laws; more deeply it enjoins a spiritual or ethical purity of the mind with action as one outward index. It says strongly enough, almost too strongly, "Thou shouldst not kill," but insists more firmly on the injunction, "Thou shalt not hate, thou shalt not yield to greed, anger or malice," for these are the roots of killing. And Hinduism admits relative standards, a wisdom too hard for the European intelligence. Non-injuring is the very highest of its laws, *ahimsā paramo dharmah*; still it does not lay it down as a physical rule for the warrior, but insistently demands from him mercy, chivalry, respect for the non-belligerent, the weak, the unarmed, the vanquished, the prisoner, the wounded, the fugitive, and so escapes the unpracticality of a too absolutist rule for all life. A misunderstanding of this inwardness and this wise relativity is perhaps responsible for much misrepresentation. The Western ethicist likes to have a high standard as a counsel of perfection and is not too much concerned if it is honoured more by the breach than by the observance; Indian ethics puts up an equally high and often higher standard; but less concerned with high professions than with truth of life, it admits stages of progress and in the lower stages is satisfied if it can moralise as much as possible those who are not yet capable of the highest ethical concepts and practice.

All these criticisms of Hinduism are therefore either false in

fact or invalid in their very nature. It remains to be considered whether the farther yet more common charge is justified in full or in part,—the damaging accusation that Indian culture depresses the vital force, paralyses the will, gives no great or vigorous power, no high incentive, no fortifying and ennobling motive to human life.

A Rationalistic Critic on Indian Culture – 5

THE QUESTION before us is whether Indian culture has a sufficient power for the fortifying and ennobling of our normal human existence. Apart from its transcendental aims, has it any pragmatic, non-ascetic, dynamic value, any power for expansion of life and for the right control of life? This is a question of central importance. For if it has nothing of this kind to give us, then whatever its other cultural greatness, it cannot live. It becomes an abnormal cis-Himalayan hot-house splendour which could subsist in its peninsular seclusion, but must perish in the keen and arduous air of the modern struggle of life. No anti-vital culture can survive. A too intellectual or too ethereal civilisation void of strong vital stimulus and motive must languish for want of sap and blood. A culture to be permanently and completely serviceable to man must give him something more than some kind of rare transcendental uprush towards an exceeding of all earthly life-values. It must do more even than adorn with a great curiosity of knowledge, science and philosophic enquiry or a rich light and blaze of art, poetry and architecture the long stability and orderly well-being of an old, ripe and humane society. All this Indian culture did in the past to a noble purpose. But it must satisfy too the tests of a progressive Life-power. There must be some inspiration for the terrestrial endeavour of man, an object, a stimulus, a force for development and a will to live. Whether or not our end is silence and Nirvana, a spiritual cessation or a material death, this is certain that the world itself is a mighty labour of a vast Life-Spirit and man the present doubtful crown on earth and the struggling but still unsuccessful present hero and protagonist of its endeavour or its drama. A great human culture must see this

truth in some fullness; it must impart some conscious and ideal power of self-effectuation to this upward effort. It is not enough to found a stable base for life, not enough to adorn it, not enough to shoot up sublimely to summits beyond it; the greatness and growth of the race on earth must be our equal care. To miss this great intermediate reality is a capital imperfection and in itself a seal of failure.

Our critics will have it that the whole body of Indian culture bears the stamp of just such a failure. The Western impression has been that Hinduism is an entirely metaphysical and other-worldly system dreaming of things beyond, oblivious of the now and here: a depressing sense of the unreality of life or an intoxication of the Infinite turns it away from any nobility, vitality and greatness of human aspiration and the earth's labour. Its philosophy may be sublime, its religious spirit fervent, its ancient social system strong, symmetrical and stable, its literature and its art good in their own way, but the salt of life is absent, the breath of will-power, the force of a living endeavour. This new journalistic Apollo, our Archer who is out to cleave with his arrows the python coils of Indian barbarism, abounds in outcries in this sense. But, if that is so, evidently India can have done nothing great, contributed no invigorating power to human life, produced no men of mighty will, no potent personalities, no strong significant human lives, no vital human figures in art and poetry, no significant architecture and sculpture. And that is what our devil's advocate tells us in graphic phrases. He tells us that there is in this religion and philosophy a general undervaluing of life and endeavour. Life is conceived as a shoreless expanse in which generations rise and fall as helplessly and purposelessly as waves in mid-ocean; the individual is everywhere dwarfed and depreciated; one solitary great character, Gautama Buddha, who "perhaps never existed," is India's sole contribution to the world's pantheon, or for the rest a pale featureless Asoka. The characters of drama and poetry are lifeless exaggerations or puppets of supernatural powers; the art is empty of reality; the whole history of the civilisation makes a drab, effete, melancholy picture. There is no power of life in this religion and this

philosophy, there is no breath of life in this history, there is no colour of life in this art and poetry; that is the blank result of Indian culture. Whoever has seen at first hand and felt the literature, followed the history, studied the civilisation of India, can see that this is a bitter misrepresentation, a violent caricature, an absurd falsehood. But it is an extreme and unscrupulous way of putting an impression often given to the European mind and, as before, we must see why different eyes see the same object in such different colours. It is the same primary misunderstanding that is at the root. India has lived and lived richly, splendidly, greatly, but with a different will in life from Europe. The idea and plan of her life have been peculiar to her temperament, original and unique. Her values are not easy to seize for an outsider and her highest things are easily open to hostile misrepresentation by the ignorant, precisely because they are too high for the normal untrained mind and apt to shoot beyond its limits.

There are three powers that we must grasp in order to judge the life-value of a culture. There is, first, the power of its original conception of life; there is, next, the power of the forms, types and rhythms it has given to life; there is, last, the inspiration, the vigour, the force of vital execution of its motives manifested in the actual lives of men and of the community that flourished under its influence. The European conception of life is a thing with which we in India are now very familiar, because our present thought and effort are obscured with its shadow when they are not filled with its presence. For we have been trying hard to assimilate something of it, even to shape ourselves and especially our political, economic and outward conduct into some imitation of its forms and rhythms. The European idea is the conception of a Force that manifests itself in the material universe and a Life in it of which man is almost the only discoverable meaning. This anthropocentric view of things has not been altered by the recent stress of Science on the vast blank inanities of an inconscient mechanical Nature. And in man, thus unique in the inert drift of Nature, the whole effort of Life is to arrive at some light and harmony of the understanding and ordering reason, some efficient rational power, adorning

beauty, strong utility, vital enjoyment, economic welfare. The free power of the individual ego, the organised will of the corporate ego, these are the great needed forces. The development of individual personality and an organised efficient national life are the two things that matter in the European ideal. These two powers have grown, striven, run riot at times, and the restless and often violent vividness of the historic stir and the literary and artistic vivacity of Europe are due to their powerful colours. The enjoyment of life and force, the gallop of egoistic passion and vital satisfaction are a loud and insistent strain, a constant high-voiced motive. Against them is another opposite effort, the endeavour to govern life by reason, science, ethics, art; a restraining and harmonising utility is here the foremost motive. At different times different powers have taken the lead. Christian religiosity too has come in and added new tones, modified some tendencies, deepened others. Each age and period has increased the wealth of contributory lines and forces and helped the complexity and largeness of the total conception. At present the sense of the corporate life dominates and it is served by the idea of a great intellectual and material progress, an ameliorated political and social state governed by science. There is an ideal of intelligent utility, liberty and equality or else an ideal of stringent organisation and efficiency and a perfectly mobilised, carefully marshalled uniting of forces in a ceaseless pull towards the general welfare. This endeavour of Europe has become terribly outward and mechanical in its appearance; but some renewed power of a more humanistic idea is trying to beat its way in again and man may perhaps before long refuse to be tied on the wheel of his own triumphant machinery and conquered by his apparatus. At any rate we need not lay too much emphasis on what may be a passing phase. The broad permanent European conception of life remains and it is in its own limits a great and invigorating conception,—imperfect, narrow at the top, shut in under a heavy lid, poor in its horizons, too much of the soil, but still with a sense in it that is strenuous and noble.

The Indian conception of life starts from a deeper centre and moves on less external lines to a very different objective. The

peculiarity of the Indian eye of thought is that it looks through the form, looks even through the force, and searches for the spirit in things everywhere. The peculiarity of the Indian will in life is that it feels itself to be unfulfilled, not in touch with perfection, not permanently justified in any intermediate satisfaction if it has not found and does not live in the truth of the spirit. The Indian idea of the world, of Nature and of existence is not physical, but psychological and spiritual. Spirit, soul, consciousness are not only greater than inert matter and inconscient force, but they precede and originate these lesser things. All force is power or means of a secret spirit; the Force that sustains the world is a conscious Will and Nature is its machinery of executive power. Matter is the body or field of a consciousness hidden within it, the material universe a form and movement of the Spirit. Man himself is not a life and mind born of Matter and eternally subject to physical Nature, but a spirit that uses life and body. It is an understanding faith in this conception of existence, it is the attempt to live it out, it is the science and practice of this high endeavour, and it is the aspiration to break out in the end from this mind bound to life and matter into a greater spiritual consciousness that is the innermost sense of Indian culture. It is this that constitutes the much-talked-of Indian spirituality. It is evidently very remote from the dominant European idea; it is different even from the form given by Europe to the Christian conception of life. But it does not mean at all that Indian culture concedes no reality to life, follows no material or vital aims and satisfactions or cares to do nothing for our actual human existence. It cannot truly be contended that a conception of this kind can give no powerful and inspiring motive to the human effort of man. Certainly, in this view, matter, mind, life, reason, form are only powers of the spirit and valuable not for their own sake, but because of the Spirit within them. *Ātmārtham*, they exist for the sake of the Self, says the Upanishad, and this is certainly the Indian attitude to these things. But that does not deprecate them or deprive them of their value; on the contrary it increases a hundredfold their significance. Form and body immensely increase in importance if they are felt to be instinct

with the life of the Spirit and are conceived as a support for the rhythm of its workings. And human life was in ancient Indian thought no vile and unworthy existence; it is the greatest thing known to us, it is desired, the Purana boldly says, even by the gods in heaven. The deepening and raising of the richest or the most potent energies of our minds, our hearts, our life-power, our bodies are all means by which the spirit can proceed to self-discovery and the return to its own infinite freedom and power. For when mind and heart and reason heighten to their greatest lights and powers, they bring embodied life to the point where it can open to a still greater light and power beyond them; the individual mind widens into a vast universal consciousness and lifts towards a high spiritual transcendence. These are at least no sterilising and depressing ideas; they exalt the life of man and make something like godhead its logical outcome.

The dignity given to human existence by the Vedantic thought and by the thought of the classical ages of Indian culture exceeded anything conceived by the Western idea of humanity. Man in the West has always been only an ephemeral creature of Nature or a soul manufactured at birth by an arbitrary breath of the whimsical Creator and set under impossible conditions to get salvation, but far more likely to be thrown away into the burning refuse-heap of Hell as a hopeless failure. At best he is exalted by a reasoning mind and will and an effort to be better than God or Nature made him. Far more ennobling, inspiring, filled with the motive-force of a great idea is the conception placed before us by Indian culture. Man in the Indian idea is a spirit veiled in the works of energy, moving to self-discovery, capable of Godhead. He is a soul that is growing through Nature to conscious self-hood; he is a divinity and an eternal existence; he is an ever-flowing wave of the God-ocean, an inextinguishable spark of the supreme Fire. Even, he is in his uttermost reality identical with the ineffable Transcendence from which he came and greater than the godheads whom he worships. The natural half-animal creature that for a while he seems to be is not at all his whole being and is not in any way his real being. His inmost reality is the divine Self or at least one dynamic eternal portion

of it, and to find that and exceed his outward, apparent, natural self is the greatness of which he alone of terrestrial beings is capable. He has the spiritual capacity to pass to a supreme and extraordinary pitch of manhood and that is the first aim which is proposed to him by Indian culture. Living no more in the first crude type of an undeveloped humanity to which most men still belong, *na yathā prākṛto janah*, he can even become a free perfected semi-divine man, *mukta, siddha*. But he can do more; released into the cosmic consciousness, his spirit can become one with God, one self with the Spirit of the universe or rise into a Light and Vastness that transcends the universe; his nature can become one dynamic power with universal Nature or one Light with a transcendental Gnosis. To be shut up for ever in his ego is not his ultimate perfection; he can become a universal soul, one with the supreme Unity, one with others, one with all beings. This is the high sense and power concealed in his humanity that he can aspire to this perfection and transcendence. And he can arrive at it through any or all of his natural powers if they will accept release, through his mind and reason and thought and their illuminations, through his heart and its unlimited power of love and sympathy, through his will and its dynamic drive towards mastery and right action, through his ethical nature and its hunger for the universal Good, through his aesthetic sense and its seekings after delight and beauty or through his inner soul and its power of absolute spiritual calm, wideness, joy and peace.

This is the sense of that spiritual liberation and perfection of which Indian thought and inner discipline have been full since the earliest Vedic times. However high and arduous this aim may be, it has always seemed to it possible and even in a way near and normal, once spiritual realisation has discovered its path. The positivist Western mind finds it difficult to give this conception the rank of a living and intelligible idea. The status of the *siddha, bhāgavata, mukta* appears to it a baseless chimera. It seems to its Christian associations a blasphemy against the solitary greatness of God, before whom man is only a grovelling worm, to its fierce attachment to the normal ego a negation of personality

and a repellent menace, to its earthbound rationalism a dream, a self-hypnotic hallucination or a deluding mania. And yet in ancient Europe the Stoics, Platonists, Pythagoreans had made some approach to this aspiration, and even afterwards, a few rare souls have envisaged or pursued it through occult ways. And now it is again beginning to percolate into the Western imagination, but less as a dynamic life-motive than in poetry and in certain aspects of general thought or through movements like Theosophy that draw from ancient and oriental sources. Science and philosophy and religion still regard it with scorn as an illusion, with indifference as a dream or with condemnation as a heathen arrogance. It is the distinction of Indian culture to have seized on this great dynamic hope, to have kept it a living and practicable thing and to have searched out all the possible paths to this spiritual way of perfect existence. Indian thought has made this great thing the common highest aim and universal spiritual destiny of the soul that is in every human creature.

The value of the Indian conception for life must depend on the relations and gradations by which it connects this difficult and distant perfection with our normal living and present everyday nature. Put over against the latter without any connection or any gradations that lead up to it and make it possible, it would either be a high unattainable ideal or the detached remote passion of a few exceptional spirits. Or even it would discourage the springs of our natural life by the too great contrast between this spiritual being and our own poor imperfect nature. Something of the kind has happened in later times; the current Western impression about the exaggerated asceticism and otherworldliness of Indian religion and philosophy is founded on the growing gulf created by a later thought between man's spiritual possibilities and his terrestrial status. But we must not be misled by extreme tendencies or the overemphasis put upon them in a period of decline. If we would get at the real meaning of the Indian idea of life, we must go back to its best times. And we must not look at this or that school of philosophy or at some side of it as the whole of Indian thought; the totality of the ancient philosophical thinking, religion, literature, art, society

must be our ground of enquiry. The Indian conception in its early soundness made no such mistake as to imagine that this great thing can or even ought to be done by some violent, intolerant, immediate leap from one pole of existence to its opposite. Even the most extreme philosophies do not go so far. The workings of the Spirit in the universe were a reality to one side of the Indian mind, to another only a half reality, a self-descriptive Lila or illusory Maya. To the one the world was an action of the Infinite Energy, Shakti, to the other a figment of some secondary paradoxical consciousness in the Eternal, Maya: but life as an intermediate reality was never denied by any school of Indian thinking. Indian thought recognised that the normal life of man has to be passed through with a conscientious endeavour to fulfil its purpose: its powers must be developed with knowledge; its forms must be perused, interpreted and fathomed; its values must be worked out, possessed and lived; its enjoyments must be fully taken on their own level. Only afterwards can we go on to self-existence or a supra-existence. The spiritual perfection which opens before man is the crown of a long, patient, millennial outflowering of the spirit in life and nature. This belief in a gradual spiritual progress and evolution here is indeed the secret of the almost universal Indian acceptance of the truth of reincarnation. It is only by millions of lives in inferior forms that the secret soul in the universe, conscious even in the inconscient, *cetano acetaneṣu*, has arrived at humanity: it is only by hundreds or thousands, perhaps even millions of human lives that man can grow into his divine self-existence. Every life is a step which he can take backward or forward; his action in life, his will in life, his thought and knowledge by which he governs and directs his life, determine what he is yet to be from the earliest stages to the last transcendence. *Yathā karma yathā śrutam.*

This belief in a gradual soul evolution with a final perfection or divine transcendence and human life as its first direct means and often repeated opportunity, is the pivot of the Indian conception of existence. This gives to our life the figure of an ascent in spirals or circles; and the long period of the ascent has to be filled in with human knowledge and human action

and human experience. There is room within it for all terrestrial aims, activities and aspirations; there is place in the ascent for all types of human character and nature. For the spirit in the world assumes hundreds of forms and follows many tendencies and gives many shapes to his play or *līlā*. All are part of the total mass of our necessary experience; each has its justification, each has its natural or true law and reason of being, each has its utility in the play and the process. The claim of sense satisfaction was not ignored, it was given its just importance. The soul's need of labour and heroic action was not stifled, it was urged to its fullest action and freest scope. The hundred forms of the pursuit of knowledge were given an absolute freedom of movement; the play of the emotions was allowed, refined, trained till they were fit for the divine levels; the demand of the aesthetic faculties was encouraged in its highest rarest forms and in life's commonest details. Indian culture did not deface nor impoverish the richness of the grand game of human life; it never depressed or mutilated the activities of our nature. On the contrary, subject to a certain principle of harmony and government, it allowed them their full, often their extreme value. Man was allowed to fathom on his way all experience, to give to his character and action a large rein and heroic proportions, and to fill in life opulently with colour and beauty and enjoyment. This life side of the Indian idea is stamped in strong relief over the epic and the classical literature. It is amazing indeed that anyone with an eye or a brain could have read the Ramayana, Mahabharata, the dramas, the literary epics, the romances, and the great abundance of gnomic and lyric poetry in Sanskrit and in the later tongues (to say nothing of the massive remains of other cultural work and social and political system and speculation), and yet failed to perceive this breadth, wealth and greatness. One must have read without eyes to see or without a mind to understand; most indeed of the adverse critics have not read or studied at all, but only flung about their preconceived notions with a violent or a high-browed ignorant assurance.

But while it is the generous office of culture to enrich, enlarge and encourage human life, it must also give the vital

forces a guiding law, subject them to some moral and rational government and lead them beyond their first natural formulations, until it can find for life the clue to a spiritual freedom, perfection and greatness. The preeminent value of the ancient Indian civilisation lay in the power with which it did this work, the profound wisdom and high and subtle skill with which it based society and ordered the individual life, and encouraged and guided the propensities of human nature and finally turned them all towards the realisation of its master idea. The mind it was training, while not called away from its immediate aims, was never allowed to lose sight of the use of life as a discipline for spiritual perfection and a passage to the Infinite.

The Indian mind whether in the government of life or in the discipline of spirituality kept always in sight two main truths of our existence. First, our being in its growth has stages through which it must pass: if there are sometimes leaps forward, yet most of its growth is a developing progression; the swiftest race has its stadia. Then again, life is complex and the nature of man is complex; in each life man has to figure a certain sum of its complexity and put that into some kind of order. But the initial movement of life is that form of it which develops the powers of the natural ego in man; self-interest and hedonistic desire are the original human motives,—*kāma, artha*. Indian culture gave a large recognition to this primary turn of our nature. These powers have to be accepted and put in order; for the natural ego-life must be lived and the forces it evolves in the human being must be brought to fullness. But this element must be kept from making any too unbridled claim or heading furiously towards its satisfaction; only so can it get its full results without disaster and only so can it be inspired eventually to go beyond itself and turn in the end to a greater spiritual Good and Bliss. An internal or external anarchy cannot be the rule; a life governed in any absolute or excessive degree by self-will, passion, sense-attraction, self-interest and desire cannot be the natural whole of a human or a humane existence. The tempting imagination that it can and that this is the true law is a lure with which the Western mind has played in characteristic leanings

or outbursts; but this turn unjustly called Paganism,—for the Greek or Pagan intelligence had a noble thought for law and harmony and self-rule,—is alien to the Indian spirit. India has felt the call of the senses not less than Greece, Rome or modern Europe; she perceived very well the possibility of a materialistic life and its attraction worked on certain minds and gave birth to the philosophy of the Charvakas: but this could not take full hold or establish even for a time any dominant empire. Even if we can see in it, when lived on a grand scale, a certain perverse greatness, still a colossal egoism indulgent of the sole life of the mind and the senses was regarded by her as the nature of the Asura and Rakshasa. It is the Titanic, gigantic or demoniac type of spirit, permitted in its own plane, but not the proper law for a human life. Another power claims man and overtops desire and self-interest and self-will, the power of the Dharma.

The Dharma, at once religious law of action and deepest law of our nature, is not, as in the Western idea, a creed, cult or ideal inspiring an ethical and social rule; it is the right law of functioning of our life in all its parts. The tendency of man to seek after a just and perfect law of his living finds its truth and its justification in the Dharma. Every thing indeed has its dharma, its law of life imposed on it by its nature; but for man the dharma is the conscious imposition of a rule of ideal living on all his members. Dharma is fixed in its essence, but still it develops in our consciousness and evolves and has its stages; there are gradations of spiritual and ethical ascension in the search for the highest law of our nature. All men cannot follow in all things one common and invariable rule. Life is too complex to admit of the arbitrary ideal simplicity which the moralising theorist loves. Natures differ; the position, the work we have to do has its own claims and standards; the aim and bent, the call of life, the call of the spirit within is not the same for everyone: the degree and turn of development and the capacity, *adhikāra*, are not equal. Man lives in society and by society, and every society has its own general dharma, and the individual life must be fitted into this wider law of movement. But there too the individual's part in society and his nature and the needs of his capacity and

temperament vary and have many kinds and degrees: the social law must make some room for this variety and would lose by being rigidly one for all. The man of knowledge, the man of power, the productive and acquisitive man, the priest, scholar, poet, artist, ruler, fighter, trader, tiller of the soil, craftsman, labourer, servant cannot usefully have the same training, cannot be shaped in the same pattern, cannot all follow the same way of living. All ought not to be put under the same tables of the law; for that would be a senseless geometric rigidity that would spoil the plastic truth of life. Each has his type of nature and there must be a rule for the perfection of that type; each has his own proper function and there must be a canon and ideal for the function. There must be in all things some wise and understanding standard of practice and idea of perfection and living rule,—that is the one thing needful for the Dharma. A lawless impulsion of desire and interest and propensity cannot be allowed to lead human conduct; even in the frankest following of desire and interest and propensity there must be a governing and restraining and directing line, a guidance. There must be an ethic or a science, a restraint as well as a scope arising from the truth of the thing sought, a standard of perfection, an order. Differing with the type of the man and the type of the function these special dharmas would yet rise towards the greater law and truth that contains and overtops the others and is universally effective. This then was the Dharma, special for the special person, stage of development, pursuit of life or individual field of action, but universal too in the broad lines which all ought to pursue.

The universal embracing dharma in the Indian idea is a law of ideal perfection for the developing mind and soul of man; it compels him to grow in the power and force of certain high or large universal qualities which in their harmony build a highest type of manhood. In Indian thought and life this was the ideal of the best, the law of the good or noble man, the discipline laid down for the self-perfecting individual, *ārya*, *śrestha*, *sajjana*, *sādhu*. This ideal was not a purely moral or ethical conception, although that element might predominate; it was also intellectual, religious, social, aesthetic, the flowering of the whole ideal

man, the perfection of the total human nature. The most varied qualities met in the Indian conception of the best, *śrestha*, the good and noble man, *ārya*. In the heart benevolence, beneficence, love, compassion, altruism, long-suffering, liberality, kindliness, patience; in the character courage, heroism, energy, loyalty, continence, truth, honour, justice, faith, obedience and reverence where these were due, but power too to govern and direct, a fine modesty and yet a strong independence and noble pride; in the mind wisdom and intelligence and love of learning, knowledge of all the best thought, an openness to poetry, art and beauty, an educated capacity and skill in works; in the inner being a strong religious sense, piety, love of God, seeking after the Highest, the spiritual turn; in social relations and conduct a strict observance of all the social dharmas, as father, son, husband, brother, kinsman, friend, ruler or subject, master or servant, priest or warrior or worker, king or sage, member of clan or caste: this was the total ideal of the Arya, the man of high upbringing and noble nature. The ideal is clearly portrayed in the written records of ancient India during two millenniums and it is the very life-breath of Hindu ethics. It was the creation of an at once ideal and rational mind, spirit-wise and worldly-wise, deeply religious, nobly ethical, firmly yet flexibly intellectual, scientific and aesthetic, patient and tolerant of life's difficulties and human weakness, but arduous in self-discipline. This was the mind that was at the base of the Indian civilisation and gave its characteristic stamp to all the culture.

But even this was only the foundation and preparation for another highest thing which by its presence exalts human life beyond itself into something spiritual and divine. Indian culture raised the crude animal life of desire, self-interest and satisfied propensity beyond its first intention to a noble self-exceeding and shapeliness by infusing into it the order and high aims of the Dharma. But its profounder characteristic aim—and in this it was unique—was to raise this nobler life too of the self-perfecting human being beyond its own intention to a mightiest self-exceeding and freedom; it laboured to infuse into it the great aim of spiritual liberation and perfection, *mukti*, *mokṣa*.

The Law and its observance are neither the beginning nor the end of man; there is beyond the field of the Law a larger realm of consciousness in which, climbing, he emerges into a great spiritual freedom. Not a noble but ever death-bound manhood is the highest height of man's perfection: immortality, freedom, divinity are within his grasp. Ancient Indian culture held this highest aim constantly before the inner eye of the soul and insistently inspired with its prospect and light the whole conception of existence. The entire life of the individual was ennobled by this aim; the whole ordering of society was cast into a scale of graduated ascension towards this supreme summit.

A well-governed system of the individual and communal existence must be always in the first instance an ordering of the three first powers recognised by Indian thought. The claim of the natural functionings must be recognised in it to the full; the pursuit of personal and communal interest and the satisfaction of human desires as of human needs must be amply admitted and there must be an understanding combination of knowledge and labour towards these ends. But all must be controlled, uplifted and widened to greater aims by the ideal of the Dharma. And if, as India believes, there is a higher spiritual consciousness towards which man can rise, that ascent must be kept throughout in view as the supreme goal of life. The system of Indian culture at once indulged and controlled man's nature; it fitted him for his social role; it stamped on his mind the generous ideal of an accomplished humanity refined, harmonised in all its capacities, ennobled in all its members; but it placed before him too the theory and practice of a highest change, familiarised him with the conception of a spiritual existence and sowed in him a hunger for the divine and the infinite. The symbols of his religion were filled with suggestions which led towards it; at every step he was reminded of lives behind and in front and of worlds beyond the material existence; he was brought close to the nearness, even to the call and pressure of the Spirit who is greater than the life it informs, of the final goal, of a high possible immortality, freedom, God-consciousness, divine Nature. Man was not allowed to forget that he had in him a

highest self beyond his little personal ego and that always he and all things live, move and have their being in God, in the Eternal, in the Spirit. There were ways and disciplines provided in number by which he could realise this liberating truth or could at least turn and follow at a distance this highest aim according to his capacity and nature, *adhikāra*. Around him he saw and revered the powerful practicants and the mighty masters of these disciplines. These men were in early times the teachers of his youth, the summits of his society, the inspirers and fountain-heads of his civilisation, the great lights of his culture. Spiritual freedom, spiritual perfection were not figured as a far-off intangible ideal, but presented as the highest human aim towards which all must grow in the end, and were made near and possible to his endeavour from a first practicable basis of life and the Dharma. The spiritual idea governed, enlightened and gathered towards itself all the other life-motives of a great civilised people.

A Rationalistic Critic on Indian Culture – 6

THESE are the principal lines upon which the structure of Indian civilisation was founded and they constitute the power of its conception of life. I do not think it can be said that there is here any inferiority to other human cultures or to any established conception of life that has ever held sway over the mind of man in historic times. There is nothing here that can be said to discourage life and its flowering or to deprive it of impetus and elevation and a great motive. On the contrary there is a full and frank recognition and examination of the whole of human existence in all its variety and range and power, there is a clear and wise and noble idea for its right government and there is an ideal tendency pointing it upward and a magnificent call to a highest possible perfection and greatness. These are the serious uses of culture, these are the things that raise the life of man above a crude, primitive barbarism. If a civilisation is to be judged by the power of its ideas, their power for these great uses, Indian civilisation was inferior to none. Certainly, it was not perfect or final or complete; for that can be alleged of no past or present cultural idea or system. Man is in his inmost self an infinite being, in his mind and life too he is continually growing, with whatever stumblings and long relapses, and he cannot be permanently bound in any one system of ideas or frame of living. The structures in which he lives are incomplete and provisional; even those which seem the most comprehensive lose their force to stand and are convicted by time of insufficiency and must be replaced or change. But this at least can be said of the Indian idea that it seized with a remarkable depth and comprehensiveness on the main truths and needs of the whole human being, on his mind and life and body, his artistic and ethical and intellectual

parts of nature, his soul and spirit, and gave them a subtle and liberal, a profoundly large and high and wise, a sympathetic and yet nobly arduous direction. More cannot be said for any past or any existing culture.

But there must be in any culture aiming at completeness, not only great and noble governing and inspiring ideas, but a harmony of forms and rhythms, a mould into which the ideas and the life can run and settle. Here we must be prepared for a lesser perfection, a greater incompleteness. And the reason is that just as the spirit is vaster than its ideas, the ideas too are larger than their forms, moulds and rhythms. Form has a certain fixity which limits; no form can exhaust or fully express the potentialities of the idea or force that gave it birth. Neither can any idea, however great, or any limited play of force or form bind the infinite spirit: that is the secret of earth's need of mutation and progress. The idea is only a partial expression of the spirit. Even within its own limits, on its own lines it ought always to become more supple, to fill itself out with other views, to rise and broaden to new applications, and often it has to lose itself in uplifting transformations of its own meaning into vaster significances or fuse itself into new and richer syntheses. In the history of all great cultures therefore we find a passage through three periods, for this passage is a necessary consequence of this truth of things. There is a first period of large and loose formation; there is a second period in which we see a fixing of forms, moulds and rhythms; and there is a closing or a critical period of superannuation, decay and disintegration. This last stage is the supreme crisis in the life of a civilisation; if it cannot transform itself, it enters into a slow lingering decline or else collapses in a death agony brought about by the rapid impact of stronger and more immediately living though not necessarily greater or truer powers or formations. But if it is able to shake itself free of limiting forms, to renovate its ideas and to give a new scope to its spirit, if it is willing to understand, master and assimilate novel growths and necessities, then there is a rebirth, a fresh lease of life and expansion, a true renascence.

Indian civilisation passed in its own large and leisurely manner through all these stages. Its first period was that of a great spiritual outflowering in which the forms were supple, flexible and freely responsive to its essential spirit. That fluid movement passed away into an age of strong intellectuality in which all was fixed into distinct, sufficiently complex, but largely treated and still supple forms and rhythms. There came as a consequence a period of richly crystallised fixity shaken by crises which were partly met by a change of ideas and a modification of forms. But the hard binding of set forms triumphed at last and there was a decline of the inspiring spirit, a stagnation of living force, a progressive decay of the outward structure. This decay was accompanied and at once arrested for a moment and hastened in the end by the impact of other cultures. Today we are in the midst of a violent and decisive crisis brought about by the inflooding of the West and of all for which it stands. An upheaval resulted that began with the threat of a total death and irretrievable destruction of the culture; but its course is now uplifted on the contrary by the strong hope of a great revival, transmutation and renascence. Each of these three stages has its special significance for the student of culture. If we would understand the essential spirit of Indian civilisation, we must go back to its first formative period, the early epoch of the Veda and the Upanishads, its heroic creative seed-time. If we would study the fixed forms of its spirit and discern the thing it eventually realised as the basic rhythm of its life, we must look with an observing eye at the later middle period of the Shastras and the classic writings, the age of philosophy and science, legislation and political and social theory and many-sided critical thought, religious fixation, art, sculpture, painting, architecture. If we would discover the limitations, the points at which it stopped short and failed to develop its whole or its true spirit, we must observe closely the unhappy disclosures of its period of decline. If, finally, we would discover the directions it is likely to follow in its transformation, we must try to fathom what lies beneath the still confused movements of its crisis of renascence. None of these can indeed be cut clean apart from each other; for what developed in one period

is already forecast and begun in the preceding age: but still on a certain large and imprecise scale we can make these distinctions and they are necessary for a discerning analytic view. But at present we are only concerned with the developed forms and the principal rhythms which persisted through its greater eras.

The problem which Indian culture had to solve was that of a firm outward basis on which to found the practical development of its spirit and its idea in life. How are we to take the natural life of man and, while allowing it sufficient scope and variety and freedom, yet to subject it to a law, canon, dharma, a law of function, a law of type, a law of each actual unideal human tendency and a law too of highest ideal intention? And how again are we to point that dharma towards its own exceeding by the fulfilment and cessation of its disciplinary purpose in the secure freedom of the spiritual life? Indian culture from an early stage seized upon a double idea for its own guidance which it threw into a basic system of the individual life in the social frame. This was the double system of the four Varnas and the four Asramas,—four graded classes of society and four successive stages of a developing human life.

The ancient Chaturvarnya must not be judged by its later disintegrated degeneration and gross meaningless parody, the caste system. But neither was it precisely the system of the classes which we find in other civilisations, priesthood, nobility, merchant class and serfs or labourers. It may have had outwardly the same starting-point, but it was given a very different revealing significance. The ancient Indian idea was that man falls by his nature into four types. There are, first and highest, the man of learning and thought and knowledge; next, the man of power and action, ruler, warrior, leader, administrator; third in the scale, the economic man, producer and wealth-getter, the merchant, artisan, cultivator: these were the twice-born, who received the initiation, Brahmin, Kshatriya, Vaishya. Last came the more undeveloped human type, not yet fit for these steps of the scale, unintellectual, without force, incapable of creation or intelligent production, the man fit only for unskilled labour and menial service, the Shudra. The economic order of society was

cast in the form and gradation of these four types. The Brahmin class was called upon to give the community its priests, thinkers, men of letters, legists, scholars, religious leaders and guides. The Kshatriya class gave it its kings, warriors, governors and administrators. The Vaishya order supplied it with its producers, agriculturists, craftsmen, artisans, merchants and traders. The Shudra class ministered to its need of menials and servants. As far as this went, there was nothing peculiar in the system except its extraordinary durability and, perhaps, the supreme position given to religion, thought and learning, not only at the top of the scale,—for that can be paralleled from one or two other civilisations,—but as the dominant power. The Indian idea in its purity fixed the status of a man in this order not by his birth, but by his capacities and his inner nature, and, if this rule had been strictly observed, that would have been a very clear mark of distinctness, a superiority of a unique kind. But even the best society is always something of a machine and gravitates towards the material sign and standard, and to found truly the social order upon this finer psychological basis would have been in those times a difficult and vain endeavour. In practice we find that birth became the basis of the Varna. It is elsewhere that we must look for the strong distinguishing mark which has made of this social structure a thing apart and sole in its type.

At no time indeed was the adherence to the economic rule quite absolute. The early ages show a considerable flexibility which was not quite lost in the process of complex crystallisation into a fixed form. And even in the greater rigidity of the latter-day caste system there has been in practice a confusion of economic functions. The vitality of a vigorous community cannot obey at every point the indications of a pattern and tradition cut by the mechanising mind. Moreover there was always a difference between the ideal theory of the system and its rougher unideal practice. For the material side of an idea or system has always its weaknesses even in its best times, and the final defect of all systems of this kind is that they stiffen into a fixed hierarchy which cannot maintain permanently its purity or the utility it was meant to serve. It becomes a soulless

form and prolongs itself in a state of corruption, degeneracy or oppressive formalism when the uses that justified it are no longer in existence. Even when its ways can no longer be made consistent with the developing needs of the growth of humanity, the formal system persists and corrupts the truth of life and blocks progress. Indian society did not escape this general law; it was overtaken by these deficiencies, lost the true sense of the thing which it set out to embody and degenerated into a chaos of castes, developing evils which we are now much embarrassed to eliminate. But it was a well-devised and necessary scheme in its time; it gave the community the firm and nobly built stability it needed for the security of its cultural development,—a stability hardly paralleled in any other culture. And, as interpreted by the Indian genius, it became a greater thing than a mere outward economic, political and social mechanism intended to serve the needs and convenience of the collective life.

For the real greatness of the Indian system of the four varnas did not lie in its well-ordered division of economic function; its true originality and permanent value was in the ethical and spiritual content which the thinkers and builders of the society poured into these forms. This inner content started with the idea that the intellectual, ethical and spiritual growth of the individual is the central need of the race. Society itself is only the necessary framework for this growth; it is a system of relations which provides it with its needed medium, field and conditions and with a nexus of helpful influences. A secure place had to be found in the community for the individual man from which he could at once serve these relations, helping to maintain the society and pay it his debt of duty and assistance, and proceed to his own self-development with the best possible aid from the communal life. Birth was accepted in practice as the first gross and natural indicator; for heredity to the Indian mind has always ranked as a factor of the highest importance: it was even taken in later thought as a sign of the nature and as an index to the surroundings which the individual had prepared for himself by his past soul-development in former existences. But birth is not and cannot be the sole test of Varna. The intellectual capacity

of the man, the turn of his temperament, his ethical nature, his spiritual stature, these are the important factors. There was erected therefore a rule of family living, a system of individual observance and self-training, a force of upbringing and education which would bring out and formulate these essential things. The individual man was carefully trained in the capacities, habits and attainments, and habituated to the sense of honour and duty necessary for the discharge of his allotted function in life. He was scrupulously equipped with the science of the thing he had to do, the best way to succeed in it as an interest, *artha*, and to attain to the highest rule, canon and recognised perfection of its activities, economic, political, sacerdotal, literary, scholastic or whatever else they might be. Even the most despised pursuits had their education, their law and canon, their ambition of success, their sense of honour in the discharge and scruple of well-doing, their dignity of a fixed standard of perfection, and it was because they had these things that even the lowest and least attractive could be in a certain degree a means of self-finding and ordered self-satisfaction. In addition to this special function and training there were the general accomplishments, sciences, arts, graces of life, those which satisfy the intellectual, aesthetic and hedonistic powers of human nature. These in ancient India were many and various, were taught with minuteness, thoroughness and subtlety and were available to all men of culture.

But while there was provision for all these things and it was made with a vivid liberality of the life-spirit and a noble sense of order, the spirit of Indian culture did not, like other ancient cultures, stop here. It said to the individual: "This is only the substructure; it is of a pressing importance indeed, but still not the last and greatest thing. When you have paid your debt to society, filled well and admirably your place in its life, helped its maintenance and continuity and taken from it your legitimate and desired satisfactions, there still remains the greatest thing of all. There is still your own self, the inner you, the soul which is a spiritual portion of the Infinite, one in its essence with the Eternal. This self, this soul in you you have to find, you are here for that, and it is from the place I have provided for you in life

and by this training that you can begin to find it. For to each Varna I have supplied its highest ideal of manhood, the highest ideal way of which your nature is capable. By directing your life and nature in its own law of being towards that perfection, you can not only grow towards the ideal and enter into harmony with universal nature but come also into nearness and contact with a greater nature of divinity and move towards transcendence. That is the real object before you. From the life-basis I give you you can rise to the liberating knowledge which brings a spiritual release, *mokṣa*. Then you can grow out of all these limitations in which you are being trained; you can grow through the fulfilled Dharma and beyond it into the eternity of your self, into the fullness, freedom, greatness and bliss of the immortal spirit; for that is what each man is behind the veils of his nature. When you have done that you are free. Then you have gone beyond all the dharmas; you are then a universal soul, one with all existence, and you can either act in that divine liberty for the good of all living things or else turn to enjoy in solitude the bliss of eternity and transcendence." The whole system of society, founded on the four varnas, was made a harmonious means for the elevation and progress of the soul, mind and life from the natural pursuit of interest and desire first to the perfection of the law of our being, Dharma, and at the end to a highest spiritual freedom. For man's true end in life must be always this realisation of his own immortal self, this entry in its secret of an infinite and eternal existence.

The Indian system did not entirely leave this difficult growth to the individual's unaided inner initiative. It supplied him with a framework; it gave him a scale and gradation for his life which could be made into a kind of ladder rising in that sense. This high convenience was the object of the four Asramas. Life was divided into four natural periods and each of them marked out a stage in the working out of this cultural idea of living. There was the period of the student, the period of the householder, the period of the recluse or forest-dweller, the period of the free supersocial man, *parivrājaka*. The student life was framed to lay the groundwork of what the man had to know, do and

be. It gave a thorough training in the necessary arts, sciences, branches of knowledge, but it was still more insistent on the discipline of the ethical nature and in earlier days contained as an indispensable factor a grounding in the Vedic formula of spiritual knowledge. In these earlier days this training was given in suitable surroundings far away from the life of cities and the teacher was one who had himself passed through the round of this circle of living and, very usually, even, one who had arrived at some remarkable realisation of spiritual knowledge. But subsequently education became more intellectual and mundane; it was imparted in cities and universities and aimed less at an inner preparation of character and knowledge and more at instruction and the training of the intelligence. But in the beginning the Aryan man was really prepared in some degree for the four great objects of his life, *artha*, *kāma*, *dharma*, *mokṣa*. Entering into the householder stage to live out his knowledge, he was able to serve there the three first human objects; he satisfied his natural being and its interests and desire to take the joy of life, he paid his debt to the society and its demands and by the way he discharged his life functions he prepared himself for the last greatest purpose of his existence. In the third stage he retired to the forest and worked out in a certain seclusion the truth of his spirit. He lived in a broad freedom from the stricter social bonds; but if he so willed, gathering the young around him or receiving the inquirer and seeker, he could leave his knowledge to the new rising generation as an educator or a spiritual teacher. In the last stage of life he was free to throw off every remaining tie and to wander over the world in an extreme spiritual detachment from all the forms of social life, satisfying only the barest necessities, communing with the universal spirit, making his soul ready for eternity. This circle was not obligatory on all. The great majority never went beyond the two first stages; many passed away in the *vānaprastha* or forest stage. Only the rare few made the last extreme venture and took the life of the wandering recluse. But this profoundly conceived cycle gave a scheme which kept the full course of the human spirit in its view; it could be taken advantage of by all according to their

actual growth and in its fullness by those who were sufficiently developed in their present birth to complete the circle.

On this first firm and noble basis Indian civilisation grew to its maturity and became a thing rich, splendid and unique. While it filled the view with the last mountain prospect of a supreme spiritual elevation, it did not neglect the life of the levels. It lived between the busy life of the city and village, the freedom and seclusion of the forest and the last overarching illimitable ether. Moving firmly between life and death it saw beyond both and cut out a hundred high-roads to immortality. It developed the external nature and drew it into the inner self; it enriched life to raise it into the spirit. Thus founded, thus trained, the ancient Indian race grew to astonishing heights of culture and civilisation; it lived with a noble, well-based, ample and vigorous order and freedom; it developed a great literature, sciences, arts, crafts, industries; it rose to the highest possible ideals and no mean practice of knowledge and culture, of arduous greatness and heroism, of kindness, philanthropy and human sympathy and oneness; it laid the inspired basis of wonderful spiritual philosophies; it examined the secrets of external nature and discovered and lived the boundless and miraculous truths of the inner being; it fathomed self and understood and possessed the world. As the civilisation grew in richness and complexity, it lost indeed the first grand simplicity of its early order. The intellect towered and widened, but intuition waned or retreated into the hearts of the saints and adepts and mystics. A greater stress came to be laid on scientific system, accuracy and order, not only in all the things of the life and mind, but even in the things of the spirit; the free flood of intuitive knowledge was forced to run in hewn channels. Society became more artificial and complex, less free and noble; more of a bond on the individual, it was less a field for the growth of his spiritual faculties. The old fine integral harmony gave place to an exaggerated stress on one or other of its elemental factors. *Artha* and *kāma*, interest and desire were in some directions developed at the expense of the *dharma*. The lines of the *dharma* were filled and stamped in with so rigid a distinctness as to stand in the way of the freedom of the spirit.

Spiritual liberation was pursued in hostility to life and not as its full-orbed result and high crowning. But still some strong basis of the old knowledge remained to inspire, to harmonise, to keep alive the soul of India. Even when deterioration came and a slow collapse, even when the life of the community degenerated into an uneasily petrified ignorance and confusion, the old spiritual aim and tradition remained to sweeten and humanise and save in its worst days the Indian peoples. For we see that it continually swept back on the race in new waves and high outbursts of life-giving energy or leaped up in intense kindlings of the spiritualised mind or heart, even as it now rises once more in all its strength to give the impulse of a great renascence.

Indian Spirituality and Life

I HAVE described the framework of the Indian idea from the outlook of an intellectual criticism, because that is the standpoint of the critics who affect to disparage its value. I have shown that Indian culture must be adjudged even from this alien outlook to have been the creation of a wide and noble spirit. Inspired in the heart of its being by a lofty principle, illumined with a striking and uplifting idea of individual manhood and its powers and its possible perfection, aligned to a spacious plan of social architecture, it was enriched not only by a strong philosophic, intellectual and artistic creativeness but by a great and vivifying and fruitful life-power. But this by itself does not give an adequate account of its spirit or its greatness. One might describe Greek or Roman civilisation from this outlook and miss little that was of importance; but Indian civilisation was not only a great cultural system, but an immense religious effort of the human spirit.

The whole root of difference between Indian and European culture springs from the spiritual aim of Indian civilisation. It is the turn which this aim imposes on all the rich and luxuriant variety of its forms and rhythms that gives to it its unique character. For even what it has in common with other cultures gets from that turn a stamp of striking originality and solitary greatness. A spiritual aspiration was the governing force of this culture, its core of thought, its ruling passion. Not only did it make spirituality the highest aim of life, but it even tried, as far as that could be done in the past conditions of the human race, to turn the whole of life towards spirituality. But since religion is in the human mind the first native, if imperfect form of the spiritual impulse, the predominance of the spiritual idea, its endeavour to take hold of life, necessitated a casting of thought and action into the religious mould and a persistent filling of every circumstance

of life with the religious sense; it demanded a pervasively religio-philosophic culture. The highest spirituality indeed moves in a free and wide air far above that lower stage of seeking which is governed by religious form and dogma; it does not easily bear their limitations and, even when it admits, it transcends them; it lives in an experience which to the formal religious mind is unintelligible. But man does not arrive immediately at that highest inner elevation and, if it were demanded from him at once, he would never arrive there. At first he needs lower supports and stages of ascent; he asks for some scaffolding of dogma, worship, image, sign, form, symbol, some indulgence and permission of mixed half-natural motive on which he can stand while he builds up in him the temple of the spirit. Only when the temple is completed, can the supports be removed, the scaffolding disappear. The religious culture which now goes by the name of Hinduism not only fulfilled this purpose, but, unlike certain creational religions, it knew its purpose. It gave itself no name, because it set itself no sectarian limits; it claimed no universal adhesion, asserted no sole infallible dogma, set up no single narrow path or gate of salvation; it was less a creed or cult than a continuously enlarging tradition of the Godward endeavour of the human spirit. An immense many-sided many-staged provision for a spiritual self-building and self-finding, it had some right to speak of itself by the only name it knew, the eternal religion, *sanātana dharma*. It is only if we have a just and right appreciation of this sense and spirit of Indian religion that we can come to an understanding of the true sense and spirit of Indian culture.

Now just here is the first baffling difficulty over which the European mind stumbles; for it finds itself unable to make out what Hindu religion is. Where, it asks, is its soul? where is its mind and fixed thought? where is the form of its body? How can there be a religion which has no rigid dogmas demanding belief on pain of eternal damnation, no theological postulates, even no fixed theology, no credo distinguishing it from antagonistic or rival religions? How can there be a religion which has no papal head, no governing ecclesiastic body, no church, chapel

or congregational system, no binding religious form of any kind obligatory on all its adherents, no one administration and discipline? For the Hindu priests are mere ceremonial officiants without any ecclesiastical authority or disciplinary powers and the Pundits are mere interpreters of the Shastra, not the lawgivers of the religion or its rulers. How again can Hinduism be called a religion when it admits all beliefs, allowing even a kind of high-reaching atheism and agnosticism and permits all possible spiritual experiences, all kinds of religious adventures? The only thing fixed, rigid, positive, clear is the social law, and even that varies in different castes, regions, communities. The caste rules and not the Church; but even the caste cannot punish a man for his beliefs, ban heterodoxy or prevent his following a new revolutionary doctrine or a new spiritual leader. If it excommunicates Christian or Muslim, it is not for religious belief or practice, but because they break with the social rule and order. It has been asserted in consequence that there is no such thing as a Hindu religion, but only a Hindu social system with a bundle of the most disparate religious beliefs and institutions. The precious dictum that Hinduism is a mass of folk-lore with an ineffective coat of metaphysical daubing is perhaps the final judgment of the superficial occidental mind on this matter.

This misunderstanding springs from the total difference of outlook on religion that divides the Indian mind and the normal Western intelligence. The difference is so great that it could only be bridged by a supple philosophical training or a wide spiritual culture; but the established forms of religion and the rigid methods of philosophical thought practised in the West make no provision and even allow no opportunity for either. To the Indian mind the least important part of religion is its dogma; the religious spirit matters, not the theological credo. On the contrary to the Western mind a fixed intellectual belief is the most important part of a cult; it is its core of meaning, it is the thing that distinguishes it from others. For it is its formulated beliefs that make it either a true or a false religion, according as it agrees or does not agree with the credo of its critic. This notion, however foolish and shallow, is a necessary consequence

of the Western idea which falsely supposes that intellectual truth is the highest verity and, even, that there is no other. The Indian religious thinker knows that all the highest eternal verities are truths of the spirit. The supreme truths are neither the rigid conclusions of logical reasoning nor the affirmations of credal statement, but fruits of the soul's inner experience. Intellectual truth is only one of the doors to the outer precincts of the temple. And since intellectual truth turned towards the Infinite must be in its very nature many-sided and not narrowly one, the most varying intellectual beliefs can be equally true because they mirror different facets of the Infinite. However separated by intellectual distance, they still form so many side-entrances which admit the mind to some faint ray from a supreme Light. There are no true and false religions, but rather all religions are true in their own way and degree. Each is one of the thousand paths to the One Eternal.

Indian religion placed four necessities before human life. First, it imposed upon the mind a belief in a highest consciousness or state of existence universal and transcendent of the universe, from which all comes, in which all lives and moves without knowing it and of which all must one day grow aware, returning towards that which is perfect, eternal and infinite. Next, it laid upon the individual life the need of self-preparation by development and experience till man is ready for an effort to grow consciously into the truth of this greater existence. Thirdly, it provided it with a well-founded, well-explored, many-branching and always enlarging way of knowledge and of spiritual or religious discipline. Lastly, for those not yet ready for these higher steps it provided an organisation of the individual and collective life, a framework of personal and social discipline and conduct, of mental and moral and vital development by which they could move each in his own limits and according to his own nature in such a way as to become eventually ready for the greater existence. The first three of these elements are the most essential to any religion, but Hinduism has always attached to the last also a great importance; it has left out no part of life as a thing secular and foreign to the religious and spiritual life. Still the

Indian religious tradition is not merely the form of a religio-social system, as the ignorant critic vainly imagines. However greatly that may count at the moment of a social departure, however stubbornly the conservative religious mind may oppose all pronounced or drastic change, still the core of Hinduism is a spiritual, not a social discipline. Actually we find religions like Sikhism counted in the Vedic family although they broke down the old social tradition and invented a novel form, while the Jains and Buddhists were traditionally considered to be outside the religious fold although they observed Hindu social custom and intermarried with Hindus, because their spiritual system and teaching figured in its origin as a denial of the truth of Veda and a departure from the continuity of the Vedic line. In all these four elements that constitute Hinduism there are major and minor differences between Hindus of various sects, schools, communities and races; but nevertheless there is also a general unity of spirit, of fundamental type and form and of spiritual temperament which creates in this vast fluidity an immense force of cohesion and a strong principle of oneness.

The fundamental idea of all Indian religion is one common to the highest human thinking everywhere. The supreme truth of all that is is a Being or an existence beyond the mental and physical appearances we contact here. Beyond mind, life and body there is a Spirit and Self containing all that is finite and infinite, surpassing all that is relative, a supreme Absolute, originating and supporting all that is transient, a one Eternal. A one transcendent, universal, original and sempiternal Divinity or divine Essence, Consciousness, Force and Bliss is the fount and continent and inhabitant of things. Soul, nature, life are only a manifestation or partial phenomenon of this self-aware Eternity and this conscious Eternal. But this Truth of being was not seized by the Indian mind only as a philosophical speculation, a theological dogma, an abstraction contemplated by the intelligence. It was not an idea to be indulged by the thinker in his study, but otherwise void of practical bearing on life. It was not a mystic sublimation which could be ignored in the dealings of man with the world and Nature. It was a living spiritual

Truth, an Entity, a Power, a Presence that could be sought by all according to their degree of capacity and seized in a thousand ways through life and beyond life. This Truth was to be lived and even to be made the governing idea of thought and life and action. This recognition and pursuit of something or someone Supreme is behind all forms the one universal credo of Indian religion, and if it has taken a hundred shapes, it was precisely because it was so much alive. The Infinite alone justifies the existence of the finite and the finite by itself has no entirely separate value or independent existence. Life, if it is not an illusion, is a divine Play, a manifestation of the glory of the Infinite. Or it is a means by which the soul growing in Nature through countless forms and many lives can approach, touch, feel and unite itself through love and knowledge and faith and adoration and a Godward will in works with this transcendent Being and this infinite Existence. This Self or this self-existent Being is the one supreme reality, and all things else are either only appearances or only true by dependence upon it. It follows that self-realisation and God-realisation are the great business of the living and thinking human being. All life and thought are in the end a means of progress towards self-realisation and God-realisation.

Indian religion never considered intellectual or theological conceptions about the supreme Truth to be the one thing of central importance. To pursue that Truth under whatever conception or whatever form, to attain to it by inner experience, to live in it in consciousness, this it held to be the sole thing needful. One school or sect might consider the real self of man to be indivisibly one with the universal Self or the supreme Spirit. Another might regard man as one with the Divine in essence but different from him in Nature. A third might hold God, Nature and the individual soul in man to be three eternally different powers of being. But for all the truth of Self held with equal force; for even to the Indian dualist God is the supreme self and reality in whom and by whom Nature and man live, move and have their being and, if you eliminate God from his view of things, Nature and man would lose for him all their meaning

and importance. The Spirit, universal Nature (whether called Maya, Prakriti or Shakti) and the soul in living beings, Jiva, are the three truths which are universally admitted by all the many religious sects and conflicting religious philosophies of India. Universal also is the admission that the discovery of the inner spiritual self in man, the divine soul in him, and some kind of living and uniting contact or absolute unity of the soul in man with God or supreme Self or eternal Brahman is the condition of spiritual perfection. It is open to us to conceive and have experience of the Divine as an impersonal Absolute and Infinite or to approach and know and feel Him as a transcendent and universal sempiternal Person: but whatever be our way of reaching him, the one important truth of spiritual experience is that he is in the heart and centre of all existence and all existence is in him and to find him is the great self-finding. Differences of credal belief are to the Indian mind nothing more than various ways of seeing the one Self and Godhead in all. Self-realisation is the one thing needful; to open to the inner Spirit, to live in the Infinite, to seek after and discover the Eternal, to be in union with God, that is the common idea and aim of religion, that is the sense of spiritual salvation, that is the living Truth that fulfils and releases. This dynamic following after the highest spiritual truth and the highest spiritual aim are the uniting bond of Indian religion and, behind all its thousand forms, its one common essence.

If there were nothing else to be said in favour of the spiritual genius of the Indian people or the claim of Indian civilisation to stand in the front rank as a spiritual culture, it would be sufficiently substantiated by this single fact that not only was this greatest and widest spiritual truth seen in India with the boldest largeness, felt and expressed with a unique intensity, and approached from all possible sides, but it was made consciously the grand uplifting idea of life, the core of all thinking, the foundation of all religion, the secret sense and declared ultimate aim of human existence. The truth announced is not peculiar to Indian thinking; it has been seen and followed by the highest minds and souls everywhere. But elsewhere it has been the

living guide only of a few thinkers, or of some rare mystics or exceptionally gifted spiritual natures. The mass of men have had no understanding, no distant perception, not even a reflected glimpse of this something Beyond; they have lived only in the lower sectarian side of religion, in inferior ideas of the Deity or in the outward mundane aspects of life. But Indian culture did succeed by the strenuousness of its vision, the universality of its approach, the intensity of its seeking in doing what has been done by no other culture. It succeeded in stamping religion with the essential ideal of a real spirituality; it brought some living reflection of the very highest spiritual truth and some breath of its influence into every part of the religious field. Nothing can be more untrue than to pretend that the general religious mind of India has not at all grasped the higher spiritual or metaphysical truths of Indian religion. It is a sheer falsehood or a wilful misunderstanding to say that it has lived always in the externals only of rite and creed and shibboleth. On the contrary, the main metaphysical truths of Indian religious philosophy in their broad idea-aspects or in an intensely poetic and dynamic representation have been stamped on the general mind of the people. The ideas of Maya, Lila, divine Immanence are as familiar to the man in the street and the worshipper in the temple as to the philosopher in his seclusion, the monk in his monastery and the saint in his hermitage. The spiritual reality which they reflect, the profound experience to which they point, has permeated the religion, the literature, the art, even the popular religious songs of a whole people.

It is true that these things are realised by the mass of men more readily through the fervour of devotion than by a strenuous effort of thinking; but that is as it must and should be since the heart of man is nearer to the Truth than his intelligence. It is true, too, that the tendency to put too much stress on externals has always been there and worked to overcloud the deeper spiritual motive; but that is not peculiar to India, it is a common failing of human nature, not less but rather more evident in Europe than in Asia. It has needed a constant stream of saints and religious thinkers and the teaching of illuminated Sannyasins to keep the

reality vivid and resist the deadening weight of form and ceremony and ritual. But the fact remains that these messengers of the spirit have never been wanting. And the still more significant fact remains that there has never been wanting either a happy readiness in the common mind to listen to the message. The ordinary materialised souls, the external minds are the majority in India as everywhere. How easy it is for the superior European critic to forget this common fact of our humanity and treat this turn as a peculiar sin of the Indian mentality! But at least the people of India, even the "ignorant masses" have this distinction that they are by centuries of training nearer to the inner realities, are divided from them by a less thick veil of the universal ignorance and are more easily led back to a vital glimpse of God and Spirit, self and eternity than the mass of men or even the cultured elite anywhere else. Where else could the lofty, austere and difficult teaching of a Buddha have seized so rapidly on the popular mind? Where else could the songs of a Tukaram, a Ramprasad, a Kabir, the Sikh gurus and the chants of the Tamil saints with their fervid devotion but also their profound spiritual thinking have found so speedy an echo and formed a popular religious literature? This strong permeation or close nearness of the spiritual turn, this readiness of the mind of a whole nation to turn to the highest realities is the sign and fruit of an age-long, a real and a still living and supremely spiritual culture.

The endless variety of Indian philosophy and religion seems to the European mind interminable, bewildering, wearisome, useless; it is unable to see the forest because of the richness and luxuriance of its vegetation; it misses the common spiritual life in the multitude of its forms. But this infinite variety is itself, as Vivekananda pertinently pointed out, a sign of a superior religious culture. The Indian mind has always realised that the Supreme is the Infinite; it has perceived, right from its Vedic beginnings, that to the soul in Nature the Infinite must always present itself in an endless variety of aspects. The mentality of the West has long cherished the aggressive and quite illogical idea of a single religion for all mankind, a religion universal by the very force of its narrowness, one set of dogmas, one

cult, one system of ceremonies, one array of prohibitions and injunctions, one ecclesiastical ordinance. That narrow absurdity prances about as the one true religion which all must accept on peril of persecution by men here and spiritual rejection or fierce eternal punishment by God in other worlds. This grotesque creation of human unreason, the parent of so much intolerance, cruelty, obscurantism and aggressive fanaticism, has never been able to take firm hold of the free and supple mind of India. Men everywhere have common human failings, and intolerance and narrowness especially in the matter of observances there has been and is in India. There has been much violence of theological disputation, there have been querulous bickerings of sects with their pretensions to spiritual superiority and greater knowledge, and sometimes, at one time especially in southern India in a period of acute religious differences, there have been brief local outbreaks of active mutual tyranny and persecution even unto death. But these things have never taken the proportions which they assumed in Europe. Intolerance has been confined for the most part to the minor forms of polemical attack or to social obstruction or ostracism; very seldom have they transgressed across the line to the major forms of barbaric persecution which draw a long, red and hideous stain across the religious history of Europe. There has played ever in India the saving perception of a higher and purer spiritual intelligence, which has had its effect on the mass mentality. Indian religion has always felt that since the minds, the temperaments, the intellectual affinities of men are unlimited in their variety, a perfect liberty of thought and of worship must be allowed to the individual in his approach to the Infinite.

India recognised authority of spiritual experience and knowledge, but she recognised still more the need of variety of spiritual experience and knowledge. Even in the days of decline when the claim of authority became in too many directions rigorous and excessive, she still kept the saving perception that there could not be one but must be many authorities. An alert readiness to acknowledge new light capable of enlarging the old tradition has always been characteristic of the religious

mind in India. Indian civilisation did not develop to a last logical conclusion its earlier political and social liberties,—that greatness of freedom or boldness of experiment belongs to the West; but liberty of religious practice and a complete freedom of thought in religion as in every other matter have always counted among its constant traditions. The atheist and the agnostic were free from persecution in India. Buddhism and Jainism might be disparaged as unorthodox religions, but they were allowed to live freely side by side with the orthodox creeds and philosophies; in her eager thirst for truth she gave them their full chance, tested all their values, and as much of their truth as was assimilable was taken into the stock of the common and always enlarging continuity of her spiritual experience. That ageless continuity was carefully conserved, but it admitted light from all quarters. In latter times the saints who reached some fusion of the Hindu and the Islamic teaching were freely and immediately recognised as leaders of Hindu religion,—even, in some cases, when they started with a Mussulman birth and from the Mussulman standpoint. The Yogin who developed a new path of Yoga, the religious teacher who founded a new order, the thinker who built up a novel statement of the many-sided truth of spiritual existence, found no serious obstacle to their practice or their propaganda. At most they had to meet the opposition of the priest and pundit instinctively adverse to any change; but this had only to be lived down for the new element to be received into the free and pliant body of the national religion and its ever plastic order.

The necessity of a firm spiritual order as well as an untrammelled spiritual freedom was always perceived; but it was provided for in various ways and not in any one formal, external or artificial manner. It was founded in the first place on the recognition of an ever enlarging number of authorised scriptures. Of these scriptures some like the Gita possessed a common and widespread authority, others were peculiar to sects or schools: some like the Vedas were supposed to have an absolute, others a relative binding force. But the very largest freedom of interpretation was allowed, and this prevented any of these authoritative

books from being turned into an instrument of ecclesiastical tyranny or a denial of freedom to the human mind and spirit. Another instrument of order was the power of family and communal tradition, *kuladharma*, persistent but not immutable. A third was the religious authority of the Brahmins; as priests they officiated as the custodians of observance, as scholars, acting in a much more important and respected role than the officiating priesthood could claim,—for to the priesthood no great consideration was given in India,—they stood as the exponents of religious tradition and were a strong conservative power. Finally, and most characteristically, most powerfully, order was secured by the succession of Gurus or spiritual teachers, *parampara*, who preserved the continuity of each spiritual system and handed it down from generation to generation but were empowered also, unlike the priest and the Pundit, to enrich freely its significance and develop its practice. A living and moving, not a rigid continuity, was the characteristic turn of the inner religious mind of India. The evolution of the Vaishnava religion from very early times, its succession of saints and teachers, the striking developments given to it successively by Ramanuja, Madhwa, Chaitanya, Vallabhacharya and its recent stirrings of survival after a period of languor and of some fossilisation form one notable example of this firm combination of a long continuity and fixed tradition with latitude of powerful and vivid change. A more striking instance was the founding of the Sikh religion, its long line of Gurus and the novel direction and form given to it by Guru Govind Singh in the democratic institution of the Khalsa. The Buddhist Sangha and its councils, the creation of a sort of divided pontifical authority by Shankaracharya, an authority transmitted from generation to generation for more than a thousand years and even now not altogether effete, the Sikh Khalsa, the adoption of the congregational form called Samaj by the modern reforming sects indicate an attempt towards a compact and stringent order. But it is noteworthy that even in these attempts the freedom and plasticity and living sincerity of the religious mind of India always prevented it from initiating anything like the overblown ecclesiastical orders and despotic

hierarchies which in the West have striven to impose the tyranny of their obscurantist yoke on the spiritual liberty of the human race.

The instinct for order and freedom at once in any field of human activity is always a sign of a high natural capacity in that field, and a people which could devise such a union of unlimited religious liberty with an always orderly religious evolution, must be credited with a high religious capacity, even as they cannot be denied its inevitable fruit, a great, ancient and still living spiritual culture. It is this absolute freedom of thought and experience and this provision of a framework sufficiently flexible and various to ensure liberty and yet sufficiently sure and firm to be the means of a stable and powerful evolution that have given to Indian civilisation this wonderful and seemingly eternal religion with its marvellous wealth of many-sided philosophies, of great scriptures, of profound religious works, of religions that approach the Eternal from every side of his infinite Truth, of Yoga-systems of psycho-spiritual discipline and self-finding, of suggestive forms, symbols and ceremonies which are strong to train the mind at all stages of development towards the Godward endeavour. Its firm structure capable of supporting without peril a large tolerance and assimilative spirit, its vivacity, intensity, profundity and multitudinousness of experience, its freedom from the unnatural European divorce between mundane knowledge and science on the one side and religion on the other, its reconciliation of the claims of the intellect with the claims of the spirit, its long endurance and infinite capacity of revival make it stand out today as the most remarkable, rich and living of all religious systems. The nineteenth century has thrown on it its tremendous shock of negation and scepticism but has not been able to destroy its assured roots of spiritual knowledge. A little disturbed for a brief moment, surprised and temporarily shaken by this attack in a period of greatest depression of the nation's vital force, India revived almost at once and responded by a fresh outburst of spiritual activity, seeking, assimilation, formative effort. A great new life is visibly preparing in her, a mighty transformation and farther dynamic evolution and potent march forward into the

inexhaustible infinities of spiritual experience.

The many-sided plasticity of Indian cult and spiritual experience is the native sign of its truth, its living reality, the unfettered sincerity of its search and finding; but this plasticity is a constant stumbling block to the European mind. The religious thinking of Europe is accustomed to rigid impoverishing definitions, to strict exclusions, to a constant preoccupation with the outward idea, the organisation, the form. A precise creed framed by the logical or theological intellect, a strict and definite moral code to fix the conduct, a bundle of observances and ceremonies, a firm ecclesiastical or congregational organisation, that is Western religion. Once the spirit is safely imprisoned and chained up in these things, some emotional fervours and even a certain amount of mystic seeking can be tolerated — within rational limits; but, after all, it is perhaps safest to do without these dangerous spices. Trained in these conceptions, the European critic comes to India and is struck by the immense mass and intricacy of a polytheistic cult crowned at its summit by a belief in the one Infinite. This belief he erroneously supposes to be identical with the barren and abstract intellectual pantheism of the West. He applies with an obstinate prejudgment the ideas and definitions of his own thinking, and this illegitimate importation has fixed many false values on Indian spiritual conceptions, — unhappily, even in the mind of “educated” India. But where our religion eludes his fixed standards, misunderstanding, denunciation and supercilious condemnation come at once to his rescue. The Indian mind on the contrary is averse to intolerant mental exclusions; for a great force of intuition and inner experience had given it from the beginning that towards which the mind of the West is only now reaching with much fumbling and difficulty, — the cosmic consciousness, the cosmic vision. Even when it sees the One without a second, it still admits his duality of Spirit and Nature; it leaves room for his many trinities and million aspects. Even when it concentrates on a single limiting aspect of the Divinity and seems to see nothing but that, it still keeps instinctively at the back of its consciousness the sense of the All and the idea of the One. Even when it distributes its worship among

many objects, it looks at the same time through the objects of its worship and sees beyond the multitude of godheads the unity of the Supreme. This synthetic turn is not peculiar to the mystics or to a small literate class or to philosophic thinkers nourished on the high sublimities of the Veda and Vedanta. It permeates the popular mind nourished on the thoughts, images, traditions and cultural symbols of the Purana and Tantra; for these things are only concrete representations or living figures of the synthetic monism, the many-sided unitarianism, the large cosmic universalism of the Vedic scriptures.

Indian religion founded itself on the conception of a timeless, nameless and formless Supreme, but it did not feel called upon, like the narrower and more ignorant monotheisms of the younger races, to deny or abolish all intermediary forms and names and powers and personalities of the Eternal and Infinite. A colourless monism or a pale vague transcendental Theism was not its beginning, its middle and its end. The one Godhead is worshipped as the All, for all in the universe is he or made out of his being or his nature. But Indian religion is not therefore pantheism; for beyond this universality it recognises the supra-cosmic Eternal. Indian polytheism is not the popular polytheism of ancient Europe; for here the worshipper of many gods still knows that all his divinities are forms, names, personalities and powers of the One; his gods proceed from the one Purusha, his goddesses are energies of the one divine Force. Those ways of Indian cult which most resemble a popular form of Theism, are still something more; for they do not exclude, but admit the many aspects of God. Indian image-worship is not the idolatry of a barbaric or undeveloped mind; for even the most ignorant know that the image is a symbol and support and can throw it away when its use is over. The later religious forms which most felt the impress of the Islamic idea, like Nanak's worship of the timeless One, Akala, and the reforming creeds of today, born under the influence of the West, yet draw away from the limitations of Western or Semitic monotheism. Irresistibly they turn from these infantile conceptions towards the fathomless truth of Vedanta. The divine Personality of God and his human relations with

man are strongly stressed by Vaishnavism and Shaivism as the most dynamic Truth; but that is not the whole of these religions, and this divine Personality is not the limited magnified-human personal God of the West. Indian religion cannot be described by any of the definitions known to the occidental intelligence. In its totality it has been a free and tolerant synthesis of all spiritual worship and experience. Observing the one Truth from all its many sides, it shut out none. It gave itself no specific name and bound itself by no limiting distinction. Allowing separative designations for its constituting cults and divisions, it remained itself nameless, formless, universal, infinite, like the Brahman of its agelong seeking. Although strikingly distinguished from other creeds by its traditional scriptures, cults and symbols, it is not in its essential character a credal religion at all but a vast and many-sided, an always unifying and always progressive and self-enlarging system of spiritual culture.¹

It is necessary to emphasise this synthetic character and embracing unity of the Indian religious mind, because otherwise we miss the whole meaning of Indian life and the whole sense of Indian culture. It is only by recognising this broad and plastic character that we can understand its total effect on the life of the community and the life of the individual. And if we are asked, "But after all what is Hinduism, what does it teach, what does it practise, what are its common factors?" we can answer that Indian religion is founded upon three basic ideas or rather three fundamentals of a highest and widest spiritual experience. First comes the idea of the One Existence of the Veda to whom sages give different names, the One without a second of the Upanishads who is all that is and beyond all that is, the Permanent of the Buddhists, the Absolute of the Illusionists, the supreme God or Purusha of the Theists who holds in his power the soul and Nature,—in a word the Eternal, the Infinite. This

¹ The only religion that India has apparently rejected in the end, is Buddhism; but in fact this appearance is a historical error. Buddhism lost its separative force, because its spiritual substance, as opposed to its credal parts, was absorbed by the religious mind of Hindu India. Even so, it survived in the North and was exterminated not by Shankaracharya or another, but by the invading force of Islam.

is the first common foundation; but it can be and is expressed in an endless variety of formulas by the human intelligence. To discover and closely approach and enter into whatever kind or degree of unity with this Permanent, this Infinite, this Eternal, is the highest height and last effort of its spiritual experience. That is the first universal *credo* of the religious mind of India.

Admit in whatever formula this foundation, follow this great spiritual aim by one of the thousand paths recognised in India or even any new path which branches off from them and you are at the core of the religion. For its second basic idea is the manifold way of man's approach to the Eternal and Infinite. The Infinite is full of many infinities and each of these infinities is itself the very Eternal. And here in the limitations of the cosmos God manifests himself and fulfils himself in the world in many ways, but each is the way of the Eternal. For in each finite we can discover and through all things as his forms and symbols we can approach the Infinite; all cosmic powers are manifestations, all forces are forces of the One. The gods behind the workings of Nature are to be seen and adored as powers, names and personalities of the one Godhead. An infinite Conscious-Force, executive Energy, Will or Law, Maya, Prakriti, Shakti or Karma, is behind all happenings, whether to us they seem good or bad, acceptable or unacceptable, fortunate or adverse. The Infinite creates and is Brahma; it preserves and is Vishnu; it destroys or takes to itself and is Rudra or Shiva. The supreme Energy beneficent in upholding and protection is or else formulates itself as the Mother of the worlds, Luxmi or Durga. Or beneficent even in the mask of destruction, it is Chandi or it is Kali, the dark Mother. The One Godhead manifests himself in the form of his qualities in various names and godheads. The God of divine love of the Vaishnava, the God of divine power of the Shakta appear as two different godheads; but in truth they are the one infinite Deity in different figures.² One may

² This explanation of Indian polytheism is not a modern invention created to meet Western reproaches; it is to be found explicitly stated in the Gita; it is, still earlier, the sense of the Upanishads; it was clearly stated in so many words in the first ancient days by the "primitive" poets (in truth the profound mystics) of the Veda.

approach the Supreme through any of these names and forms, with knowledge or in ignorance; for through them and beyond them we can proceed at last to the supreme experience.

One thing however has to be noted that while many modernised Indian religionists tend, by way of an intellectual compromise with modern materialistic rationalism, to explain away these things as symbols, the ancient Indian religious mentality saw them not only as symbols but as world-realities,— even if to the Illusionist realities only of the world of Maya. For between the highest unimaginable Existence and our material way of being the spiritual and psychic knowledge of India did not fix a gulf as between two unrelated opposites. It was aware of other psychological planes of consciousness and experience and the truths of these supraphysical planes were no less real to it than the outward truths of the material universe. Man approaches God at first according to his psychological nature and his capacity for deeper experience, *svabhāva, adhikāra*. The level of Truth, the plane of consciousness he can reach is determined by his inner evolutionary stage. Thence comes the variety of religious cult, but its data are not imaginary structures, inventions of priests or poets, but truths of a supraphysical existence intermediate between the consciousness of the physical world and the ineffable superconsciousness of the Absolute.

The third idea of strongest consequence at the base of Indian religion is the most dynamic for the inner spiritual life. It is that while the Supreme or the Divine can be approached through a universal consciousness and by piercing through all inner and outer Nature, That or He can be met by each individual soul in itself, in its own spiritual part, because there is something in it that is intimately one or at least intimately related with the one divine Existence. The essence of Indian religion is to aim at so growing and so living that we can grow out of the Ignorance which veils this self-knowledge from our mind and life and become aware of the Divinity within us. These three things put together are the whole of Hindu religion, its essential sense and, if any credo is needed, its credo.

VIII

Indian Spirituality and Life – 2

THE TASK of religion and spirituality is to mediate between God and man, between the Eternal and Infinite and this transient, yet persistent finite, between a luminous Truth-consciousness not expressed or not yet expressed here and the Mind's ignorance. But nothing is more difficult than to bring home the greatness and uplifting power of the spiritual consciousness to the natural man forming the vast majority of the race; for his mind and senses are turned outward towards the external calls of life and its objects and never inwards to the Truth which lies behind them. This external vision and attraction are the essence of the universal blinding force which is designated in Indian philosophy the Ignorance. Ancient Indian spirituality recognised that man lives in the Ignorance and has to be led through its imperfect indications to a highest inmost knowledge. Our life moves between two worlds, the depths upon depths of our inward being and the surface field of our outward nature. The majority of men put the whole emphasis of life on the outward and live very strongly in their surface consciousness and very little in the inward existence. Even the choice spirits raised from the grossness of the common vital and physical mould by the stress of thought and culture do not usually get farther than a strong dwelling on the things of the mind. The highest flight they reach — and it is this that the West persistently mistakes for spirituality — is a preference for living in the mind and emotions more than in the gross outward life or else an attempt to subject this rebellious life-stuff to the law of intellectual truth or ethical reason and will or aesthetic beauty or of all three together. But spiritual knowledge perceives that there is a greater thing in us; our inmost self, our real being is not the intellect, not the aesthetic, ethical or thinking mind, but the divinity within, the Spirit, and these other things are only the instruments of the

Spirit. A mere intellectual, ethical and aesthetic culture does not go back to the inmost truth of the spirit; it is still an Ignorance, an incomplete, outward and superficial knowledge. To have made the discovery of our deepest being and hidden spiritual nature is the first necessity and to have erected the living of an inmost spiritual life into the aim of existence is the characteristic sign of a spiritual culture.

This endeavour takes in certain religions the form of a spiritual exclusiveness which revolts from the outward existence rather than seeks to transform it. The main tendency of the Christian discipline was not only to despise the physical and vital way of living, but to disparage and imprison the intellectual and distrust and discourage the aesthetic thirsts of our nature. It emphasised against them a limited spiritual emotionalism and its intense experiences as the one thing needful; the development of the ethical sense was the sole mental necessity, its translation into act the sole indispensable condition or result of the spiritual life. Indian spirituality reposed on too wide and many-sided a culture to admit as its base this narrow movement; but on its more solitary summits, at least in its later period, it tended to a spiritual exclusiveness loftier in vision, but even more imperative and excessive. A spirituality of this intolerant high-pointed kind, to whatever elevation it may rise, however it may help to purify life or lead to a certain kind of individual salvation, cannot be a complete thing. For its exclusiveness imposes on it a certain impotence to deal effectively with the problems of human existence; it cannot lead it to its integral perfection or combine its highest heights with its broadest broadness. A wider spiritual culture must recognise that the Spirit is not only the highest and inmost thing, but all is manifestation and creation of the Spirit. It must have a wider outlook, a more embracing range of applicability and, even, a more aspiring and ambitious aim of its endeavour. Its aim must be not only to raise to inaccessible heights the few elect, but to draw all men and all life and the whole human being upward, to spiritualise life and in the end to divinise human nature. Not only must it be able to lay hold on his deepest individual being but to inspire too his communal

existence. It must turn by a spiritual change all the members of his ignorance into members of the knowledge; it must transmute all the instruments of the human into instruments of a divine living. The total movement of Indian spirituality is towards this aim; in spite of all the difficulties, imperfections and fluctuations of its evolution, it had this character. But like other cultures it was not at all times and in all its parts and movements consciously aware of its own total significance. This large sense sometimes emerged into something like a conscious synthetic clarity, but was more often kept in the depths and on the surface dispersed in a multitude of subordinate and special stand-points. Still, it is only by an intelligence of the total drift that its manifold sides and rich variations of effort and teaching and discipline can receive their full reconciling unity and be understood in the light of its own most intrinsic purpose.

Now the spirit of Indian religion and spiritual culture has been persistently and immovably the same throughout the long time of its vigour, but its form has undergone remarkable changes. Yet if we look into them from the right centre it will be apparent that these changes are the results of a logical and inevitable evolution inherent in the very process of man's growth towards the heights. In its earliest form, its first Vedic system, it took its outward foundation on the mind of the physical man whose natural faith is in things physical, in the sensible and visible objects, presences, representations and the external pursuits and aims of this material world. The means, symbols, rites, figures, by which it sought to mediate between the spirit and the normal human mentality were drawn from these most external physical things. Man's first and primitive idea of the Divine can only come through his vision of external Nature and the sense of a superior Power or Powers concealed behind her phenomena, veiled in the heaven and earth, father and mother of our being, in the sun and moon and stars, its lights and regulators, in dawn and day and night and rain and wind and storm, the oceans and the rivers and the forests, all the circumstances and forces of her scene of action, all that vast and mysterious surrounding life of which we are a part and

in which the natural heart and mind of the human creature feel instinctively through whatever bright or dark or confused figures that there is here some divine Multitude or else mighty Infinite, one, manifold and mysterious, which takes these forms and manifests itself in these motions. The Vedic religion took this natural sense and feeling of the physical man; it used the conceptions to which they gave birth, and it sought to lead him through them to the psychic and spiritual truths of his own being and the being of the cosmos. It recognised that he was right when he saw behind the manifestations of Nature great living powers and godheads, even though he knew not their inner truth, and right too in offering to them worship and propitiation and atonement. For that inevitably must be the initial way in which his active physical, vital and mental nature is allowed to approach the Godhead. He approaches it through its visible outward manifestations as something greater than his own natural self, something single or multiple that guides, sustains and directs his life, and he calls to it for help and support in the desires and difficulties and distresses and struggles of his human existence.¹ The Vedic religion accepted also the form in which early man everywhere expressed his sense of the relation between himself and the godheads of Nature; it adopted as its central symbol the act and ritual of a physical sacrifice. However crude the notions attached to it, this idea of the necessity of sacrifice did express obscurely a first law of being. For it was founded on that secret of constant interchange between the individual and the universal powers of the cosmos which covertly supports all the process of life and develops the action of Nature.

But even in its external or exoteric side the Vedic religion did not limit itself to this acceptance and regulation of the first

¹ The Gita recognises four kinds or degrees of worshippers and God-seekers. There are first the *arthārthī* and *ārta*, those who seek him for the fulfilment of desire and those who turn for divine help in the sorrow and suffering of existence; there is next the *jijñāsu*, the seeker of knowledge, the questioner who is moved to seek the Divine in his truth and in that to meet him; last and highest, there is the *jñāni* who has already contact with the truth and is able to live in unity with the Spirit.

religious notions of the natural physical mind of man. The Vedic Rishis gave a psychic function to the godheads worshipped by the people; they spoke to them of a higher Truth, Right, Law of which the gods were the guardians, of the necessity of a truer knowledge and a larger inner living according to this Truth and Right and of a home of Immortality to which the soul of man could ascend by the power of Truth and of right doing. The people no doubt took these ideas in their most external sense; but they were trained by them to develop their ethical nature, to turn towards some initial development of their psychic being, to conceive the idea of a knowledge and truth other than that of the physical life and to admit even a first conception of some greater spiritual Reality which was the ultimate object of human worship or aspiration. This religious and moral force was the highest reach of the external cult and the most that could be understood or followed by the mass of the people.

The deeper truth of these things was reserved for the initiates, for those who were ready to understand and practise the inner sense, the esoteric meaning hidden in the Vedic scripture. For the Veda is full of words which, as the Rishis themselves express it, are secret words that give their inner meaning only to the seer, *kavaye nivacanā niryā vacāmsi*. This is a feature of the ancient sacred hymns which grew obscure to later ages; it became a dead tradition and has been entirely ignored by modern scholarship in its laborious attempt to read the hieroglyph of the Vedic symbols. Yet its recognition is essential to a right understanding of almost all the ancient religions; for mostly they started on their upward curve through an esoteric element of which the key was not given to all. In all or most there was a surface cult for the common physical man who was held yet unfit for the psychic and spiritual life and an inner secret of the Mysteries carefully disguised by symbols whose sense was opened only to the initiates. This was the origin of the later distinction between the Shudra, the undeveloped physical-minded man, and the twice-born, those who were capable of entering into the second birth by initiation and to whom alone the Vedic education could be given without danger. This too actuated the

later prohibition of any reading or teaching of the Veda by the Shudra. It was this inner meaning, it was the higher psychic and spiritual truths concealed by the outer sense, that gave to these hymns the name by which they are still known, the Veda, the Book of Knowledge. Only by penetrating into the esoteric sense of this worship can we understand the full flowering of the Vedic religion in the Upanishads and in the long later evolution of Indian spiritual seeking and experience. For it is all there in its luminous seed, preshadowed or even prefigured in the verses of the early seers. The persistent notion which through every change ascribed the foundation of all our culture to the Rishis, whatever its fabulous forms and mythical ascriptions, contains a real truth and veils a sound historic tradition. It reflects the fact of a true initiation and an unbroken continuity between this great primitive past and the riper but hardly greater spiritual development of our historic culture.

This inner Vedic religion started with an extension of the psychic significance of the godheads in the Cosmos. Its primary notion was that of a hierarchy of worlds, an ascending stair of planes of being in the universe. It saw a mounting scale of the worlds corresponding to a similar mounting scale of planes or degrees or levels of consciousness in the nature of man. A Truth, Right and Law sustains and governs all these levels of Nature; one in essence, it takes in them different but cognate forms. There is for instance the series of the outer physical light, another higher and inner light which is the vehicle of the mental, vital and psychic consciousness and a highest inmost light of spiritual illumination. Surya, the Sun-God, was the lord of the physical Sun; but he is at the same time to the Vedic seer-poet the giver of the rays of knowledge which illumine the mind and he is too the soul and energy and body of the spiritual illumination. And in all these powers he is a luminous form of the one and infinite Godhead. All the Vedic godheads have this outer and this inner and inmost function, their known and their secret Names. All are in their external character powers of physical Nature; all have in their inner meaning a psychic function and psychological ascriptions; all too are various powers of some one

highest Reality, *ekam sat*, the one infinite Existence. This hardly knowable Supreme is called often in the Veda "That Truth" or "That One", *tat satyam, tad ekam*. This complex character of the Vedic godheads assumes forms which have been wholly misunderstood by those who ascribe to them only their outward physical significance. Each of these gods is in himself a complete and separate cosmic personality of the one Existence and in their combination of powers they form the complete universal power, the cosmic whole, *vaiśvadevyam*. Each again, apart from his special function, is one godhead with the others; each holds in himself the universal divinity, each god is all the other gods. This is the aspect of the Vedic teaching and worship to which a European scholar, mistaking entirely its significance because he read it in the dim and poor light of European religious experience, has given the sounding misnomer, henotheism. Beyond, in the triple Infinite, these godheads put on their highest nature and are names of the one nameless Ineffable.

But the greatest power of the Vedic teaching, that which made it the source of all later Indian philosophies, religions, systems of Yoga, lay in its application to the inner life of man. Man lives in the physical cosmos subject to death and the "much falsehood" of the mortal existence. To rise beyond this death, to become one of the immortals, he has to turn from the falsehood to the Truth; he has to turn to the Light and to battle with and to conquer the powers of the Darkness. This he does by communion with the divine Powers and their aid; the way to call down this aid was the secret of the Vedic mystics. The symbols of the outer sacrifice are given for this purpose in the manner of the Mysteries all over the world an inner meaning; they represent a calling of the gods into the human being, a connecting sacrifice, an intimate interchange, a mutual aid, a communion. There is a building of the powers of the godheads within man and a formation in him of the universality of the divine nature. For the gods are the guardians and increasers of the Truth, the powers of the Immortal, the sons of the infinite Mother; the way to immortality is the upward way of the gods, the way of the Truth, a journey, an ascent by which there is a growth into the

law of the Truth, *ṛtasya panthāḥ*. Man arrives at immortality by breaking beyond the limitations not only of his physical self, but of his mental and his ordinary psychic nature into the highest plane and supreme ether of the Truth: for there is the foundation of immortality and the native seat of the triple Infinite. On these ideas the Vedic sages built up a profound psychological and psychic discipline which led beyond itself to a highest spirituality and contained the nucleus of later Indian Yoga. Already we find in their seed, though not in their full expansion, the most characteristic ideas of Indian spirituality. There is the one Existence, *ekam sat*, supracosmic beyond the individual and the universe. There is the one God who presents to us the many forms, names, powers, personalities of his Godhead. There is the distinction between the Knowledge and the Ignorance,² the greater truth of an immortal life opposed to the much falsehood or mixed truth and falsehood of mortal existence. There is the discipline of an inward growth of man from the physical through the psychic to the spiritual existence. There is the conquest of death, the secret of immortality, the perception of a realisable divinity of the human spirit. In an age to which in the insolence of our external knowledge we are accustomed to look back as the childhood of humanity or at best a period of vigorous barbarism, this was the inspired and intuitive psychic and spiritual teaching by which the ancient human fathers, *pūrve pitaraḥ manusyāḥ*, founded a great and profound civilisation in India.

This high beginning was secured in its results by a larger sublime efflorescence. The Upanishads have always been recognised in India as the crown and end of Veda; that is indicated in their general name, Vedanta. And they are in fact a large crowning outcome of the Vedic discipline and experience. The time in which the Vedantic truth was wholly seen and the Upanishads took shape, was, as we can discern from such records as the Chhandogya and Brihadaranyaka, an epoch of immense and strenuous seeking, an intense and ardent seed-time of the

² *Cittim acittim cinaavad vi vidvān*. "Let the knower distinguish the Knowledge and the Ignorance."

Spirit. In the stress of that seeking the truths held by the initiates but kept back from ordinary men broke their barriers, swept through the higher mind of the nation and fertilised the soil of Indian culture for a constant and ever increasing growth of spiritual consciousness and spiritual experience. This turn was not as yet universal; it was chiefly men of the higher classes, Kshatriyas and Brahmins trained in the Vedic system of education, no longer content with an external truth and the works of the outer sacrifice, who began everywhere to seek for the highest word of revealing experience from the sages who possessed the knowledge of the One. But we find too among those who attained to the knowledge and became great teachers men of inferior or doubtful birth like Janashruti, the wealthy Shudra, or Satyakama Jabali, son of a servant-girl who knew not who was his father. The work that was done in this period became the firm bedrock of Indian spirituality in later ages and from it gush still the life-giving waters of a perennial and never failing inspiration. This period, this activity, this grand achievement created the whole difference between the evolution of Indian civilisation and the quite different curve of other cultures.

For a time had come when the original Vedic symbols must lose their significance and pass into an obscurity that became impenetrable, as did the inner teaching of the Mysteries in other countries. The old poise of culture between two extremes with a bridge of religious cult and symbolism to unite them, the crude or half-trained naturalness of the outer physical man on one side of the line, and on the other an inner and secret psychic and spiritual life for the initiates could no longer suffice as the basis of our spiritual progress. The human race in its cycle of civilisation needed a large-lined advance; it called for a more and more generalised intellectual, ethical and aesthetic evolution to help it to grow into the light. This turn had to come in India as in other lands. But the danger was that the greater spiritual truth already gained might be lost in the lesser confident half-light of the acute but unillumined intellect or stifled within the narrow limits of the self-sufficient logical reason. That was what actually happened in the West, Greece leading the way. The old

knowledge was prolonged in a less inspired, less dynamic and more intellectual form by the Pythagoreans, by the Stoics, by Plato and the Neo-Platonists; but still in spite of them and in spite of the only half-illumined spiritual wave which swept over Europe from Asia in an ill-understood Christianity, the whole real trend of Western civilisation has been intellectual, rational, secular and even materialistic, and it keeps this character to the present day. Its general aim has been a strong or a fine culture of the vital and physical man by the power of an intellectualised ethics, aesthetics and reason, not the leading up of our lower members into the supreme light and power of the spirit. The ancient spiritual knowledge and the spiritual tendency it had created were saved in India from this collapse by the immense effort of the age of the Upanishads. The Vedantic seers renewed the Vedic truth by extricating it from its cryptic symbols and casting it into a highest and most direct and powerful language of intuition and inner experience. It was not the language of the intellect, but still it wore a form which the intellect could take hold of, translate into its own more abstract terms and convert into a starting-point for an ever widening and deepening philosophic speculation and the reason's long search after a Truth original, supreme and ultimate. There was in India as in the West a great upbuilding of a high, wide and complex intellectual, aesthetic, ethical and social culture. But left in Europe to its own resources, combated rather than helped by obscure religious emotion and dogma, here it was guided, uplifted and more and more penetrated and suffused by a great saving power of spirituality and a vast stimulating and tolerant light of wisdom from a highest ether of knowledge.

The second or post-Vedic age of Indian civilisation was distinguished by the rise of the great philosophies, by a copious, vivid, many-thoughted, many-sided epic literature, by the beginnings of art and science, by the evolution of a vigorous and complex society, by the formation of large kingdoms and empires, by manifold formative activities of all kinds and great systems of living and thinking. Here as elsewhere, in Greece, Rome, Persia, China, this was the age of a high outburst of the

intelligence working upon life and the things of the mind to discover their reason and their right way and bring out a broad and noble fullness of human existence. But in India this effort never lost sight of the spiritual motive, never missed the touch of the religious sense. It was a birth time and youth of the seeking intellect and, as in Greece, philosophy was the main instrument by which it laboured to solve the problems of life and the world. Science too developed, but it came second only as an auxiliary power. It was through profound and subtle philosophies that the intellect of India attempted to analyse by the reason and logical faculty what had formerly been approached with a much more living force through intuition and the soul's experience. But the philosophic mind started from the data these mightier powers had discovered and was faithful to its parent Light; it went back always in one form or another to the profound truths of the Upanishads which kept their place as the highest authority in these matters. There was a constant admission that spiritual experience is a greater thing and its light a truer if more incalculable guide than the clarities of the reasoning intelligence.

The same governing force kept its hold on all the other activities of the Indian mind and Indian life. The epic literature is full almost to excess of a strong and free intellectual and ethical thinking; there is an incessant criticism of life by the intelligence and the ethical reason, an arresting curiosity and desire to fix the norm of truth in all possible fields. But in the background and coming constantly to the front there is too a constant religious sense and an implicit or avowed assent to the spiritual truths which remained the unshakable basis of the culture. These truths suffused with their higher light secular thought and action or stood above to remind them that they were only steps towards a goal. Art in India, contrary to a common idea, dwelt much upon life; but still its highest achievement was always in the field of the interpretation of the religio-philosophical mind and its whole tone was coloured by a suggestion of the spiritual and the infinite. Indian society developed with an unsurpassed organising ability, stable effectiveness, practical insight its communal coordination of the mundane life of interest and desire,

kāma, artha; it governed always its action by a reference at every point to the moral and religious law, the Dharma: but it never lost sight of spiritual liberation as our highest point and the ultimate aim of the effort of Life. In later times when there was a still stronger secular tendency of intellectual culture, there came in an immense development of the mundane intelligence, an opulent political and social evolution, an emphatic stressing of aesthetic, sensuous and hedonistic experience. But this effort too always strove to keep itself within the ancient frame and not to lose the special stamp of the Indian cultural idea. The enlarged secular turn was compensated by a deepening of the intensities of psycho-religious experience. New religious or mystic forms and disciplines attempted to seize not only the soul and the intellect, but the emotions, the senses, the vital and the aesthetic nature of man and turn them into stuff of the spiritual life. And every excess of emphasis on the splendour and richness and power and pleasures of life had its recoil and was balanced by a corresponding potent stress on spiritual asceticism as the higher way. The two trends, on one side an extreme of the richness of life experience, on the other an extreme and pure rigorous intensity of the spiritual life, accompanied each other; their interaction, whatever loss there might be of the earlier deep harmony and large synthesis, yet by their double pull preserved something still of the balance of Indian culture.

Indian religion followed this line of evolution and kept its inner continuity with its Vedic and Vedantic origins; but it changed entirely its mental contents and colour and its outward basis. It did not effectuate this change through any protestant revolt or revolution or with any idea of an iconoclastic reformation. A continuous development of its organic life took place, a natural transformation brought out latent motives or else gave to already established motive-ideas a more predominant place or effective form. At one time indeed it seemed as if a discontinuity and a sharp new beginning were needed and would take place. Buddhism seemed to reject all spiritual continuity with the Vedic religion. But this was after all less in reality than in appearance. The Buddhist ideal of Nirvana was no more than a sharply

negative and exclusive statement of the highest Vedantic spiritual experience. The ethical system of the eightfold path taken as the way to release was an austere sublimation of the Vedic notion of the Right, Truth and Law followed as the way to immortality, *ṛtasya panthāḥ*. The strongest note of Mahayana Buddhism, its stress on universal compassion and fellow-feeling, was an ethical application of the spiritual unity which is the essential idea of Vedanta.³ The most characteristic tenets of the new discipline, Nirvana and Karma, could have been supported from the utterances of the Brahmanas and Upanishads. Buddhism could easily have claimed for itself a Vedic origin and the claim would have been no less valid than the Vedic ascription of the Sankhya philosophy and discipline with which it had some points of intimate alliance. But what hurt Buddhism and determined in the end its rejection, was not its denial of a Vedic origin or authority, but the exclusive trenchancy of its intellectual, ethical and spiritual positions. A result of an intense stress of the union of logical reason with the spiritualised mind—for it was by an intense spiritual search supported on a clear and hard rational thinking that it was born as a separate religion,—its trenchant affirmations and still more exclusive negations could not be made sufficiently compatible with the native flexibility, many-sided susceptibility and rich synthetic turn of the Indian religious consciousness; it was a high creed but not plastic enough to hold the heart of the people. Indian religion absorbed all that it could of Buddhism, but rejected its exclusive positions and preserved the full line of its own continuity, casting back to the ancient Vedanta.

This lasting line of change moved forward not by any destruction of principle, but by a gradual fading out of the prominent Vedic forms and the substitution of others. There was a transformation of symbol and ritual and ceremony or a substitution of new kindred figures, an emergence of things that are only hints in the original system, a development of novel idea-forms

³ Buddha himself does not seem to have preached his tenets as a novel revolutionary creed, but as the old Aryan way, the true form of the eternal religion.

from the seed of the original thinking. And especially there was a farther widening and fathoming of psychic and spiritual experience. The Vedic gods rapidly lost their deep original significance. At first they kept their hold by their outer cosmic sense but were overshadowed by the great Trinity, Brahma-Vishnu-Shiva, and afterwards faded altogether. A new pantheon appeared which in its outward symbolic aspects expressed a deeper truth and larger range of religious experience, an intenser feeling, a vaster idea. The Vedic sacrifice persisted only in broken and lessening fragments. The house of Fire was replaced by the temple; the karmic ritual of sacrifice was transformed into the devotional temple ritual; the vague and shifting mental images of the Vedic gods figured in the mantras yielded to more precise conceptual forms of the two great deities, Vishnu and Shiva, and of their Shaktis and their offshoots. These new concepts stabilised in physical images which were made the basis both for internal adoration and for the external worship which replaced sacrifice. The psychic and spiritual mystic endeavour which was the inner sense of the Vedic hymns, disappeared into the less intensely luminous but more wide and rich and complex psycho-spiritual inner life of Puranic and Tantric religion and Yoga.

The Purano-Tantric stage of the religion was once decried by European critics and Indian reformers as a base and ignorant degradation of an earlier and purer religion. It was rather an effort, successful in a great measure, to open the general mind of the people to a higher and deeper range of inner truth and experience and feeling. Much of the adverse criticism once heard proceeded from a total ignorance of the sense and intention of this worship. Much of this criticism has been uselessly concentrated on side-paths and aberrations which could hardly be avoided in this immensely audacious experimental widening of the basis of the culture. For there was a catholic attempt to draw towards the spiritual truth minds of all qualities and people of all classes. Much was lost of the profound psychic knowledge of the Vedic seers, but much also of new knowledge was developed, untrodden ways were opened and a hundred gates discovered into the Infinite. If we try to see the essential sense and aim of this

development and the intrinsic value of its forms and means and symbols, we shall find that this evolution followed upon the early Vedic form very much for the same reason as Catholic Christianity replaced the mysteries and sacrifices of the early Pagan religions. For in both cases the outward basis of the early religion spoke to the outward physical mind of the people and took that as the starting-point of its appeal. But the new evolution tried to awaken a more inner mind even in the common man, to lay hold on his inner vital and emotional nature, to support all by an awakening of the soul and to lead him through these things towards a highest spiritual truth. It attempted in fact to bring the mass into the temple of the spirit rather than leave them in the outer precincts. The outward physical sense was satisfied through its aesthetic turn by a picturesque temple worship, by numerous ceremonies, by the use of physical images; but these were given a psycho-emotional sense and direction that was open to the heart and imagination of the ordinary man and not reserved for the deeper sight of the elect or the strenuous tapasya of the initiates. The secret initiation remained but was now a condition for the passage from the surface psycho-emotional and religious to a profounder psychic-spiritual truth and experience.

Nothing essential was touched in its core by this new orientation; but the instruments, atmosphere, field of religious experience underwent a considerable change. The Vedic godheads were to the mass of their worshippers divine powers who presided over the workings of the outward life of the physical cosmos; the Puranic Trinity had even for the multitude a predominant psycho-religious and spiritual significance. Its more external significances, for instance the functions of cosmic creation, preservation and destruction, were only a dependent fringe of these profundities that alone touched the heart of its mystery. The central spiritual truth remained in both systems the same, the truth of the One in many aspects. The Trinity is a triple form of the one supreme Godhead and Brahman; the Shaktis are energies of the one Energy of the highest divine Being. But this greatest religious truth was no longer reserved for the initiated few; it was now more and more brought powerfully, widely and

intensely home to the general mind and feeling of the people. Even the so-called henotheism of the Vedic idea was prolonged and heightened in the larger and simpler worship of Vishnu or Shiva as the one universal and highest Godhead of whom all others are living forms and powers. The idea of the Divinity in man was popularised to an extraordinary extent, not only the occasional manifestation of the Divine in humanity which founded the worship of the Avatars, but the Presence discoverable in the heart of every creature. The systems of Yoga developed themselves on the same common basis. All led or hoped to lead through many kinds of psycho-physical, inner vital, inner mental and psycho-spiritual methods to the common aim of all Indian spirituality, a greater consciousness and a more or less complete union with the One and Divine or else an emergence of the individual soul in the Absolute. The Purano-Tantric system was a wide, assured and many-sided endeavour, unparalleled in its power, insight, amplitude, to provide the race with a basis of generalised psycho-religious experience from which man could rise through knowledge, works or love or through any other fundamental power of his nature to some established supreme experience and highest absolute status.

This great effort and achievement which covered all the time between the Vedic age and the decline of Buddhism, was still not the last possibility of religious evolution open to Indian culture. The Vedic training of the physically-minded man made the development possible. But in its turn this raising of the basis of religion to the inner mind and life and psychic nature, this training and bringing out of the psychic man ought to make possible a still larger development and support a greater spiritual movement as the leading power of life. The first stage makes possible the preparation of the natural external man for spirituality; the second takes up his outward life into a deeper mental and psychical living and brings him more directly into contact with the spirit and divinity within him; the third should render him capable of taking up his whole mental, psychical, physical living into a first beginning at least of a generalised spiritual life. This endeavour has manifested itself in the evolution of Indian spirituality and

is the significance of the latest philosophies, the great spiritual movements of the saints and bhaktas and an increasing resort to the various paths of Yoga. But unhappily it synchronised with a decline of Indian culture and an increasing collapse of its general power and knowledge, and in these surroundings it could not bear its natural fruit; but at the same time it has done much to prepare such a possibility in the future. If Indian culture is to survive and keep its spiritual basis and innate character, it is in this direction, and not in a mere revival or prolongation of the Puranic system, that its evolution must turn, rising so towards the fulfilment of that which the Vedic seers saw as the aim of man and his life thousands of years ago and the Vedantic sages cast into the clear and immortal forms of their luminous revelation.

Even the psychic-emotional part of man's nature is not the inmost door to religious feeling, nor is his inner mind the highest witness to spiritual experience. There is behind the first the inmost soul of man, in that deepest secret heart, *hṛdaye guhāyām*, in which the ancient seers saw the very tabernacle of the indwelling Godhead and there is above the second a luminous highest mind directly open to a truth of the Spirit to which man's normal nature has as yet only an occasional and momentary access. Religious evolution, spiritual experience can find their true native road only when they open to these hidden powers and make them their support for a lasting change, a divinisation of human life and nature. An effort of this kind was the very force behind the most luminous and vivid of the later movements of India's vast religious cycle. It is the secret of the most powerful forms of Vaishnavism and Tantra and Yoga. The labour of ascent from our half-animal human nature into the fresh purity of the spiritual consciousness needed to be followed and supplemented by a descent of the light and force of the spirit into man's members and the attempt to transform human into divine nature.

But it could not find its complete way or its fruit because it synchronised with a decline of the life force in India and a lowering of power and knowledge in her general civilisation and culture. Nevertheless here lies the destined force of her survival

and renewal, this is the dynamic meaning of her future. A widest and highest spiritualising of life on earth is the last vision of all that vast and unexampled seeking and experiment in a thousand ways of the soul's outermost and innermost experience which is the unique character of her past; this in the end is the mission for which she was born and the meaning of her existence.

IX

Indian Spirituality and Life – 3

IT IS essential, if we are to get a right view of Indian civilisation or of any civilisation, to keep to the central, living, governing things and not to be led away by the confusion of accidents and details. This is a precaution which the critics of our culture steadily refuse to take. A civilisation, a culture must be looked at first in its initiating, supporting, durable central motives, in its heart of abiding principle; otherwise we shall be likely to find ourselves, like these critics, in a maze without a clue and we shall stumble about among false and partial conclusions and miss entirely the true truth of the matter. The importance of avoiding this error is evident when we are seeking for the essential significance of Indian religious culture. But the same method must be held to when we proceed to observe its dynamic formulation and the effect of its spiritual ideal on life.

Indian culture recognises the spirit as the truth of our being and our life as a growth and evolution of the spirit. It sees the Eternal, the Infinite, the Supreme, the All; it sees this as the secret highest Self of all, this is what it calls God, the Permanent, the Real, and it sees man as a soul and power of this being of God in Nature. The progressive growth of the finite consciousness of man towards this Self, towards God, towards the universal, the eternal, the infinite, in a word his growth into spiritual consciousness, by the development of his ordinary ignorant natural being into an illumined divine nature, this is for Indian thinking the significance of life and the aim of human existence. To this deeper and more spiritual idea of Nature and of existence a great deal of what is strongest and most potential of fruitful consequences in recent European thinking already turns with a growing impetus. This turn may be a relapse to “barbarism” or it may be the high natural outcome of her own increasing and ripened culture; that is a question for Europe to decide. But

always to India this ideal inspiration or rather this spiritual vision of Self, God, Spirit, this nearness to a cosmic consciousness, a cosmic sense and feeling, a cosmic idea, will, love, delight into which we can release the limited, ignorant, suffering ego, this drive towards the transcendental, eternal and infinite, and the moulding of man into a conscious soul and power of that greater Existence have been the engrossing motive of her philosophy, the sustaining force of her religion, the fundamental idea of her civilisation and culture.

I have suggested that the formal turn, the rhythmic lines of effort of this culture must be regarded as having passed through two complete external stages; while a third has taken its initial steps and is the destiny of her future. The early Vedic was the first stage: then religion took its outward formal stand on the natural approach of the physical mind of man to the Godhead in the universe, but the initiates guarded the sacrificial fire of a greater spiritual truth behind the form. The Purano-Tantric was the second stage: then religion took its outward formal stand on the first deeper approaches of man's inner mind and life to the Divine in the universe, but a greater initiation opened the way to a far more intimate truth and pushed towards an inner living of the spiritual life in all its profundity and in all the infinite possibilities of an uttermost sublime experience. There has been long in preparation a third stage which belongs to the future. Its inspiring idea has been often cast out in limited or large, veiled and quiet or bold and striking spiritual movements and potent new disciplines and religions, but it has not yet been successful in finding its way or imposing new lines on human life. The circumstances were adverse, the hour not yet come. This greatest movement of the Indian spiritual mind has a double impulse. Its will is to call the community of men and all men each according to his power to live in the greatest light of all and found their whole life on some fully revealed power and grand uplifting truth of the Spirit. But it has had too at times a highest vision which sees the possibility not only of an ascent towards the Eternal but of a descent of the Divine Consciousness and a change of human into divine nature. A perception of the divinity hidden

in man has been its crowning force. This is a turn that cannot be rightly understood in the ideas or language of the European religious reformer or his imitators. It is not what the purist of the reason or the purist of the spirit imagines it to be and by that too hasty imagination falls short in his endeavour. Its index vision is pointed to a truth that exceeds the human mind and, if at all realised in his members, would turn human life into a divine superlife. And not until this third largest sweep of the spiritual evolution has come into its own, can Indian civilisation be said to have discharged its mission, to have spoken its last word and be *functus officio*, crowned and complete in its office of mediation between the life of man and the spirit.

The past dealings of Indian religion with life must be judged according to the stages of its progress; each age of its movement must be considered on its own basis. But throughout it consistently held to two perceptions that showed great practical wisdom and a fine spiritual tact. First, it saw that the approach to the spirit cannot be sudden, simple and immediate for all individuals or for the community of men; it must come ordinarily or at least at first through a gradual culture, training, progress. There must be an enlarging of the natural life accompanied by an uplifting of all its motives; a growing hold upon it of the higher rational, psychic and ethical powers must prepare and lead it towards a higher spiritual law. But the Indian religious mind saw too at the same time that if its greater aim was to be fruitful and the character of its culture imperative, there must be throughout and at every moment some kind of insistence on the spiritual motive. And for the mass of men this means always some kind of religious influence. That pervasive insistence was necessary in order that from the beginning some power of the universal inner truth, some ray from the real reality of our existence might cast its light or at least its sensible if subtle influence on the natural life of man. Human life must be induced to flower, naturally in a way, but at the same time with a wise nurturing and cultivation into its own profounder spiritual significance. Indian culture has worked by two coordinated, mutually stimulating and always interblended operations of which these perceptions are the

principle. First, it has laboured to lead upward and enlarge the life of the individual in the community through a natural series of life-stages till it was ready for the spiritual levels. But also it has striven to keep that highest aim before the mind at every stage and throw its influence on each circumstance and action both of man's inner and his outer existence.

In the plan of its first aim it came nearer to the highest ancient culture of mankind in other regions, but in a type and with a motive all its own. The frame of its system was constituted by a triple quartette. Its first circle was the synthesis and gradation of the fourfold object of life, vital desire and hedonistic enjoyment, personal and communal interest, moral right and law, and spiritual liberation. Its second circle was the fourfold order of society, carefully graded and equipped with its fixed economic functions and its deeper cultural, ethical and spiritual significances. Its third, the most original and indeed unique of its englobing life-patterns, was the fourfold scale of the successive stages of life, student, householder, forest recluse and free supersocial man. This frame, these lines of a large and noble life-training subsisted in their purity, their grand natural balance of austerity and accommodation, their fine effectiveness during the later Vedic and heroic age of the civilisation: afterwards they crumbled slowly or lost their completeness and order. But the tradition, the idea with some large effect of its force and some figure of its lines endured throughout the whole period of cultural vigour. However deflected it might have been from its true form and spirit, however mutilated and complicated for the worse, there was always left some presence of its inspiration and power. Only in the decline do we get the slow collapse, the degraded and confused mass of conventions which still labours to represent the ancient and noble Aryan system, but in spite of relics of glamour and beauty, in spite of survivals of spiritual suggestion and in spite of a residue of the old high training, is little better than a detritus or a mass of confused relics. Still even in this degradation enough of the original virtue has remained to ensure a remarkable remnant of the ancient beauty, attractiveness and power of survival.

But the turn given to the other and more direct spiritual operation of this culture is of a still greater importance. For it is that which, always surviving, has coloured permanently the Indian mind and life. It has remained the same behind every change of forms and throughout all the ages of the civilisation it has renewed its effectiveness and held its field. This second side of the cultural effort took the form of an endeavour to cast the whole of life into a religious mould; it multiplied means and devices which by their insistent suggestion and opportunity and their mass of effect would help to stamp a Godward tendency on the entire existence. Indian culture was founded on a religious conception of life and both the individual and the community drank in at every moment its influence. It was stamped on them by the training and turn of the education; the entire life atmosphere, all the social surroundings were suffused with it; it breathed its power through the whole original form and hieratic character of the culture. Always was felt the near idea of the spiritual existence and its supremacy as the ideal, highest over all others; everywhere there was the pervading pressure of the notion of the universe as a manifestation of divine Powers and a movement full of the presence of the Divine. Man himself was not a mere reasoning animal, but a soul in constant relation with God and with the divine cosmic Powers. The soul's continued existence was a cyclic or upward progress from birth to birth; human life was the summit of an evolution which terminated in the conscious Spirit, every stage of that life a step in a pilgrimage. Every single action of man had its importance of fruit whether in future lives or in the worlds beyond the material existence.

But Indian religion was not content with the general pressure of these conceptions, the training, the atmosphere, the stamp on the culture. Its persistent effort was to impress the mind at every moment and in each particular with the religious influence. And to do this more effectively by a living and practical adaptation, not asking from anyone what was too much for him or too little, it took as a guiding idea its perception of the varying natural capacity of man, *adhikāra*. It provided in its system means by which each man high or low, wise or ignorant, exceptional or

average might feel in the way suitable to his nature and evolutionary stage the call, the pressure, the influence. Avoiding the error of the religions that impose a single dogmatic and inflexible rule on every man regardless of the possibilities of his nature, it tried rather to draw him gently upward and help him to grow steadily in religious and spiritual experience. Every part of human nature, every characteristic turn of its action was given a place in the system; each was suitably surrounded with the spiritual idea and a religious influence, each provided with steps by which it might rise towards its own spiritual possibility and significance. The highest spiritual meaning of life was set on the summits of each evolving power of the human nature. The intelligence was called to a supreme knowledge, the dynamic active and creative powers pointed to openness and unity with an infinite and universal Will, the heart and sense put in contact with a divine love and joy and beauty. But this highest meaning was also put everywhere indicatively or in symbols behind the whole system of living, even in its details, so that its impression might fall in whatever degree on the life, increase in pervasion and in the end take up the entire control. This was the aim and, if we consider the imperfections of our nature and the difficulty of the endeavour, we can say that it achieved an unusual measure of success. It has been said with some truth that for the Indian the whole of life is a religion. True of the ideal of Indian life, it is true to a certain degree and in a certain sense in its fact and practice. No step could be taken in the Indian's inner or outer life without his being reminded of a spiritual existence. Everywhere he felt the closeness or at least saw the sign of something beyond his natural life, beyond the moment in time, beyond his individual ego, something other than the needs and interests of his vital and physical nature. That insistence gave its tone and turn to his thought and action and feeling; it produced that subtler sensitiveness to the spiritual appeal, that greater readiness to turn to the spiritual effort which are even now distinguishing marks of the Indian temperament. It is that readiness, that sensitiveness which justifies us when we speak of the characteristic spirituality of the Indian people.

The ancient idea of the *adhikāra* has to be taken into careful account if we would understand the peculiar character of Indian religion. In most other religious systems we find a high-pitched spiritual call and a difficult and rigid ethical standard far beyond the possibilities of man's half-evolved, defective and imperfect nature. This standard, this call are announced as if imperative on all; but it is evident that only a few can give an adequate response. There is presented to our view for all our picture of life the sharp division of two extremes; the saint and the worldling, the religious and the irreligious, the good and the bad, the pious and the impious, souls accepted and souls rejected, the sheep and the goats, the saved and the damned, the believer and the infidel, are the two categories set constantly before us. All between is a confusion, a tug of war, an uncertain balance. This crude and summary classification is the foundation of the Christian system of an eternal heaven and hell; at best, the Catholic religion humanely interposes a precarious chance hung between that happy and this dread alternative, the chance of a painful purgatory for more than nine tenths of the human race. Indian religion set up on its summits a still more high-pitched spiritual call, a standard of conduct still more perfect and absolute; but it did not go about its work with this summary and unreflecting ignorance. All beings are to the Indian mind portions of the Divine, evolving souls, and sure of an eventual salvation and release into the spirit. All must feel, as the good in them grows or, more truly, the godhead in them finds itself and becomes conscious, the ultimate touch and call of their highest self and through that call the attraction to the Eternal and Divine. But actually in life there are infinite differences between man and man; some are more inwardly evolved, others are less mature, many if not most are infant souls incapable of great steps and difficult efforts. Each needs to be dealt with according to his nature and his soul stature. But a general distinction can be drawn between three principal types varying in their openness to the spiritual appeal or to the religious influence or impulse. This distinction amounts to a gradation of three stages in the growing human consciousness. One crude, ill-formed, still outward, still

vitally and physically minded can be led only by devices suited to its ignorance. Another, more developed and capable of a much stronger and deeper psycho-spiritual experience, offers a riper make of manhood gifted with a more conscious intelligence, a larger vital or aesthetic opening, a stronger ethical power of the nature. A third, the ripest and most developed of all, is ready for the spiritual heights, fit to receive or to climb towards the loftiest ultimate truth of God and of its own being and to tread the summits of divine experience.¹

It was to meet the need of the first type or level that Indian religion created that mass of suggestive ceremony and effective ritual and strict outward rule and injunction and all that pageant of attracting and compelling symbol with which the cult is so richly equipped or profusely decorated. These are for the most part forming and indicative things which work upon the mind consciously and subconsciously and prepare it for an entry into the significance of the greater permanent things that lie behind them. And for this type too, for its vital mind and will, is intended all in the religion that calls on man to turn to a divine Power or powers for the just satisfaction of his desires and his interests, just because subject to the right and the law, the Dharma. In the Vedic times the outward ritual sacrifice and at a later period all the religious forms and notions that clustered visibly around the rites and imagery of temple worship, constant festival and ceremony and daily act of outward devotion were intended to serve this type or this soul-stage. Many of these things may seem to the developed mind to belong to an ignorant or half awakened religionism; but they have their concealed truth and their psychic value and are indispensable in this stage for the development and difficult awakening of the soul shrouded in the ignorance of material Nature.

¹ The Tantric distinction is between the animal man, the hero man and the divine man, *páśu*, *víra*, *deva*. Or we may grade the difference according to the three gunas,—first, the tamasic or rajaso-tamasic man ignorant, inert or moved only in a little light by small motive forces, the rajasic or sattwo-rajasic man struggling with an awakened mind and will towards self-development or self-affirmation, and the satwic man open in mind and heart and will to the Light, standing at the top of the scale and ready to transcend it.

The middle stage, the second type starts from these things, but gets behind them; it is capable of understanding more clearly and consciously the psychic truths, the conceptions of the intelligence, the aesthetic indications, the ethical values and all the other mediating directions which Indian religion took care to place behind its symbols. These intermediate truths vivify the outward forms of the system and those who can grasp them can go through these mental indices towards things that are beyond the mind and approach the profounder truths of the spirit. For at this stage there is already something awake that can go inward to a more deeply psycho-religious experience. Already the mind, heart and will have some strength to grapple with the difficulties of the relations between the spirit and life, some urge to satisfy more luminously or more inwardly the rational, aesthetic and ethical nature and lead them upward towards their own highest heights; one can begin to train mind and soul towards a spiritual consciousness and the opening of a spiritual existence. This ascending type of humanity claims for its use all that large and opulent middle region of philosophic, psycho-spiritual, ethical, aesthetic and emotional religious seeking which is the larger and more significant portion of the wealth of Indian culture. At this stage intervene the philosophical systems, the subtle illuminating debates and inquiries of the thinkers; here are the nobler or more passionate reaches of devotion, here are held up the higher, ampler or austerer ideals of the Dharma; here break in the psychical suggestions and first definite urgings of the eternal and infinite which draw men by their appeal and promise towards the practice of Yoga.

But these things, great as they were, were not final or supreme: they were openings, steps of ascension towards the luminous grandeurs of spiritual truth and its practice was kept ready and its means of attainment provided for the third and greatest type of human being, the third loftiest stage of the spiritual evolution. The complete light of spiritual knowledge when it emerges from veil and compromise and goes beyond all symbols and middle significances, the absolute and universal

divine love, the beauty of the All-beautiful, the noblest dharma of unity with all beings, universal compassion and benevolence calm and sweet in the perfect purity of the spirit, the upsurge of the psychical being into the spiritual unity or the spiritual ecstasy, these divinest things were the heritage of the human being ready for divinity and their way and call were the supreme significances of Indian religion and Yoga. He reached by them the fruits of his perfect spiritual evolution, an identity with the Self and Spirit, a dwelling in or with God, the divine law of his being, a spiritual universality, communion, transcendence.

But distinctions are lines that can always be overpassed in the infinite complexity of man's nature and there was no sharp and unbridgeable division, only a gradation, since the actuality or potentiality of the three powers coexist in all men. Both the middle and the highest significances were near and present and pervaded the whole system, and the approaches to the highest status were not absolutely denied to any man, in spite of certain prohibitions: but these prohibitions broke down in practice or left a way of escape to the man who felt the call; the call itself was a sign of election. He had only to find the way and the guide. But even in the direct approach the principle of *adhikāra*, differing capacity and varying nature, *svabhāva*, was recognised in subtle ways, which it would be beyond my present purpose to enumerate. One may note as an example the significant Indian idea of the *iṣṭa-devatā*, the special name, form, idea of the Divinity which each man may choose for worship and communion and follow after according to the attraction in his nature and his capacity of spiritual intelligence. And each of the forms has its outer initial associations and suggestions for the worshipper, its appeal to the intelligence, psychical, aesthetic, emotional power in the nature and its highest spiritual significance which leads through some one truth of the Godhead into the essence of spirituality. One may note too that in the practice of Yoga the disciple has to be led through his nature and according to his capacity and the spiritual teacher and guide is expected to perceive and take account of the necessary gradations and the individual need and power in his giving of help and guidance.

Many things may be objected to in the actual working of this large and flexible system and I shall take some note of them when I have to deal with the weak points or the pejorative side of the culture against which the hostile critic directs with a misleading exaggeration his missiles. But the principle of it and the main lines of the application embody a remarkable wisdom, knowledge and careful observation of human nature and an assured insight into the things of the spirit which none can question who has considered deeply and flexibly these difficult matters or had any close experience of the obstacles and potentialities of our nature in its approach to the concealed spiritual reality.

This carefully graded and complex system of religious development and spiritual evolution was linked on by a process of pervading intimate connection to that general culture of the life of the human being and his powers which must be the first care of every civilisation worth the name. The most delicate and difficult part of this task of human development is concerned with the thinking being of man, his mind of reason and knowledge. No ancient culture of which we have knowledge, not even the Greek, attached more importance to it or spent more effort on its cultivation. The business of the ancient Rishi was not only to know God, but to know the world and life and to reduce it by knowledge to a thing well understood and mastered with which the reason and will of man could deal on assured lines and on a safe basis of wise method and order. The ripe result of this effort was the Shastra. When we speak of the Shastra nowadays, we mean too often only the religio-social system of injunctions of the middle age made sacrosanct by their mythical attribution to Manu, Parashara and other Vedic sages. But in older India Shastra meant any systematised teaching and science; each department of life, each line of activity, each subject of knowledge had its science or Shastra. The attempt was to reduce each to a theoretical and practical order founded on detailed observation, just generalisation, full experience, intuitive, logical and experimental analysis and synthesis, in order to enable man to know always with a just fruitfulness for life and to act with the security of right knowledge. The smallest and the greatest

things were examined with equal care and attention and each provided with its art and science. The name was given even to the highest spiritual knowledge whenever it was stated not in a mass of intuitive experience and revelatory knowledge as in the Upanishads, but for intellectual comprehension in system and order,—and in that sense the Gita is able to call its profound spiritual teaching the most secret science, *guhyatamān śāstram*. This high scientific and philosophical spirit was carried by the ancient Indian culture into all its activities. No Indian religion is complete without its outward form of preparatory practice, its supporting philosophy and its Yoga or system of inward practice or art of spiritual living; most even of what seems irrational in it to a first glance, has its philosophical turn and significance. It is this complete understanding and philosophical character which has given religion in India its durable security and immense vitality and enabled it to resist the acid dissolvent power of modern sceptical inquiry; whatever is ill-founded in experience and reason, that power can dissolve, but not the heart and mind of these great teachings. But what we have more especially to observe is that while Indian culture made a distinction between the lower and the higher learning, the knowledge of things and the knowledge of self, it did not put a gulf between them like some religions, but considered the knowledge of the world and things as a preparatory and a leading up to the knowledge of Self and God. All Shastra was put under the sanction of the names of the Rishis, who were in the beginning the teachers not only of spiritual truth and philosophy,—and we may note that all Indian philosophy, even the logic of Nyaya and the atomic theory of the Vaisheshikas, has for its highest crowning note and eventual object spiritual knowledge and liberation,—but of the arts, the social, political and military, the physical and psychic sciences, and every instructor was in his degree respected as a *guru* or *ācārya*, a guide or preceptor of the human spirit. All knowledge was woven into one and led up by degrees to the one highest knowledge.

The whole right practice of life founded on this knowledge was in the view of Indian culture a Dharma, a living according

to a just understanding and right view of self-culture, of the knowledge of things and life and of action in that knowledge. Thus each man and class and kind and species and each activity of soul, mind, life, body has its dharma. But the largest or at least most vitally important part of the Dharma was held to be the culture and ordering of the ethical nature of man. The ethical aspect of life, contrary to the amazingly ignorant observation of a certain type of critics, attracted a quite enormous amount of attention, occupied the greater part of Indian thought and writing not devoted to the things of pure knowledge and of the spirit and was so far pushed that there is no ethical formation or ideal which does not reach in it its highest conception and a certain divine absolutism of ideal practice. Indian thought took for granted,—though there are some remarkable speculations to the contrary,—the ethical nature of man and the ethical law of the world. It considered that man was justified in satisfying his desires, since that is necessary for the satisfaction and expansion of life, but not in obeying the dictates of desire as the law of his being; for in all things there is a greater law, each has not only its side of interest and desire, but its dharma or rule of right practice, satisfaction, expansion, regulation. The Dharma, then, fixed by the wise in the Shastra is the right thing to observe, the true rule of action. First in the web of Dharma comes the social law; for man's life is only initially for his vital, personal, individual self, but much more imperatively for the community, though most imperatively of all for the greatest Self one in himself and in all beings, for God, for the Spirit. Therefore first the individual must subordinate himself to the communal self, though by no means bound altogether to efface himself in it as the extremists of the communal idea imagine. He must live according to the law of his nature harmonised with the law of his social type and class, for the nation and in a higher reach of his being—this was greatly stressed by the Buddhists—for humanity. Thus living and acting he could learn to transcend the social scale of the Dharma, practise without injuring the basis of life the ideal scale and finally grow into the liberty of the spirit, when rule and duty were not binding because he would then move and

act in a highest free and immortal dharma of the divine nature. All these aspects of the Dharma were closely linked up together in a progressive unity. Thus, for an example, each of the four orders had its own social function and ethics, but also an ideal rule for the growth of the pure ethical being, and every man by observing his dharma and turning his action Godwards could grow out of it into the spiritual freedom. But behind all dharma and ethics was put, not only as a safeguard but as a light, a religious sanction, a reminder of the continuity of life and of man's long pilgrimage through many births, a reminder of the Gods and planes beyond and of the Divine, and above it all the vision of a last stage of perfect comprehension and unity and of divine transcendence.

The system of Indian ethics liberalised by the catholicity of the ancient mind did not ban or violently discourage the aesthetic or even the hedonistic being of man in spite of a growing ascetic tendency and a certain high austerity of the summits. The aesthetic satisfactions of all kinds and all grades were an important part of the culture. Poetry, the drama, song, dance, music, the greater and lesser arts were placed under the sanction of the Rishis and were made instruments of the spirit's culture. A just theory held them to be initially the means of a pure aesthetic satisfaction and each was founded on its own basic rule and law, but on that basis and with a perfect fidelity to it still raised up to minister to the intellectual, ethical and religious development of the being. It is notable that the two vast Indian epics have been considered as much as Dharmashastras as great historico-mythic epic narratives, *itihāsas*. They are, that is to say, noble, vivid and puissant pictures of life, but they utter and breathe throughout their course the law and ideal of a great and high ethical and religious spirit in life and aim in their highest intention at the idea of the Divine and the way of the mounting soul in the action of the world. Indian painting, sculpture and architecture did not refuse service to the aesthetic satisfaction and interpretation of the social, civic and individual life of the human being; these things, as all evidences show, played a great part in their motives of creation, but still

their highest work was reserved for the greatest spiritual side of the culture, and throughout we see them seized and suffused with the brooding stress of the Indian mind on the soul, the Godhead, the spiritual, the Infinite. And we have to note too that the aesthetic and hedonistic being was made not only an aid to religion and spirituality and liberally used for that purpose, but even one of the main gates of man's approach to the Spirit. The Vaishnava religion especially is a religion of love and beauty and of the satisfaction of the whole delight-soul of man in God and even the desires and images of the sensuous life were turned by its vision into figures of a divine soul-experience. Few religions have gone so far as this immense catholicity or carried the whole nature so high in its large, puissant and many-sided approach to the spiritual and the infinite.

Finally, there is the most outwardly vital life of man, his ordinary dynamic, political, economical and social being. This too Indian culture took strenuously in hand and subjected its whole body to the pressure of its own ideals and conceptions. Its method was to build up great shastras of social living, duty and enjoyment, military and political rule and conduct and economical well-being. These were directed on one side to success, expansion, opulence and the right art and relation of these activities, but on those motives, demanded by the very nature of the vital man and his action, was imposed the law of the Dharma, a stringent social and ethical ideal and rule — thus the whole life of the king as the head of power and responsibility was regulated by it in its every hour and function, — and the constant reminder of religious duty. In latter times a Machiavellian principle of statecraft, that which has been always and is still pursued by governments and diplomats, encroached on this nobler system, but in the best age of Indian thought this depravation was condemned as a temporarily effective, but lesser, ignoble and inferior way of policy. The great rule of the culture was that the higher a man's position and power, the larger the scope of his function and influence of his acts and example, the greater should be the call on him of the Dharma. The whole law and custom of society was placed under the sanction of the Rishis and the gods,

protected from the violence of the great and powerful, given a socio-religious character and the king himself charged to live and rule as the guardian and servant of the Dharma with only an executive power over the community which was valid so long as he observed with fidelity the Law. And as this vital aspect of life is the one which most easily draws us outward and away from the inner self and the diviner aim of living, it was the most strenuously linked up at every point with the religious idea in the way the vital man can best understand, in the Vedic times by the constant reminder of the sacrifice behind every social and civic act, at a later period by religious rites, ceremonies, worship, the calling in of the gods, the insistence on the subsequent results or a supraterrestrial aim of works. So great was this preoccupation, that while in the spiritual and intellectual and other spheres a considerable or a complete liberty was allowed to speculation, action, creation, here the tendency was to impose a rigorous law and authority, a tendency which in the end became greatly exaggerated and prevented the expansion of the society into new forms more suitable for the need of the spirit of the age, the Yugadharma. A door of liberty was opened to the community by the provision of an automatic permission to change custom and to the individual in the adoption of the religious life with its own higher discipline or freedom outside the ordinary social weft of binding rule and injunction. A rigid observation and discipline of the social law, a larger nobler discipline and freer self-culture of the ideal side of the Dharma, a wide freedom of the religious and spiritual life became the three powers of the system. The steps of the expanding human spirit mounted through these powers to its perfection.

Thus the whole general character of the application of Indian ideals to life became throughout of this one texture, the constant, subtly graded, subtly harmonised preparation of the soul of man for its spiritual being. First, the regulated satisfaction of the primary natural being of man subjected to the law of the Dharma and the ethical idea and besieged at every moment by the suggestions of religion, a religion at first appealing to his more outward undeveloped mind, but in each of

its outward symbols and circumstances opening to a profounder significance, armed with the indication of a profoundest spiritual and ideal meaning as its justification. Then, the higher steps of the developed reason and psychical, ethical and aesthetic powers closely interwoven and raised by a similar opening beyond themselves to their own heights of spiritual direction and potentiality. Finally, each of these growing powers in man was made on its own line of approach a gateway into his divine and spiritual being. Thus we may observe that there was created a Yoga of knowledge for the self-exceeding of the thinking intellectual man, a Yoga of works for the self-exceeding of the active, dynamic and ethical man, a Yoga of love and bhakti for the self-exceeding of the emotional, aesthetic, hedonistic man, by which each arrived to perfection through a self-ward, spiritual, God-ward direction of his own special power, as too a Yoga of self-exceeding through the power of the psychical being and even through the power of the life in the body,—Yogas which could be practised in separation or with some kind of synthesis. But all these ways of self-exceeding led to a highest self-becoming. To become one with universal being and all existences, one with the self and spirit, united with God completed the human evolution, built the final step of man's self-culture.

X

Indian Spirituality and Life – 4

I HAVE dwelt at some length, though still very inadequately, on the principles of Indian religion, the sense of its evolution and the intention of its system, because these things are being constantly ignored and battle delivered by its defenders and assailants on details, particular consequences and side issues. Those too have their importance because they are part of the practical execution, the working out of the culture in life; but they cannot be rightly valued unless we seize hold of the intention which was behind the execution. And the first thing we see is that the principle, the essential intention of Indian culture was extraordinarily high, ambitious and noble, the highest indeed that the human spirit can conceive. For what can be a greater idea of life than that which makes it a development of the spirit in man to its most vast, secret and high possibilities,—a culture that conceives of life as a movement of the Eternal in time, of the universal in the individual, of the infinite in the finite, of the Divine in man, or holds that man can become not only conscious of the eternal and the infinite, but live in its power and universalise, spiritualise and divinise himself by self-knowledge? What greater aim can be for the life of man than to grow by an inner and outer experience till he can live in God, realise his spirit, become divine in knowledge, in will and in the joy of his highest existence? And that is the whole sense of the striving of Indian culture.

It is easy to say that these ideas are fantastic, chimerical and impracticable, that there is no spirit and no eternal and nothing divine, and man would do much better not to dabble in religion and philosophy, but rather make the best he can of the ephemeral littleness of his life and body. That is a negation natural enough to the vital and physical mind, but it rests on the assumption that man can only be what he is at the moment, and

there is nothing greater in him which it is his business to evolve; such a negation has no enduring value. The whole aim of a great culture is to lift man up to something which at first he is not, to lead him to knowledge though he starts from an unfathomable ignorance, to teach him to live by his reason, though actually he lives much more by his unreason, by the law of good and unity, though he is now full of evil and discord, by a law of beauty and harmony though his actual life is a repulsive muddle of ugliness and jarring barbarisms, by some high law of his spirit, though at present he is egoistic, material, unspiritual, engrossed by the needs and desires of his physical being. If a civilisation has not any of these aims, it can hardly at all be said to have a culture and certainly in no sense a great and noble culture. But the last of these aims, as conceived by ancient India, is the highest of all because it includes and surpasses all the others. To have made this attempt is to have ennobled the life of the race; to have failed in it is better than if it had never at all been attempted; to have achieved even a partial success is a great contribution to the future possibilities of the human being.

The system of Indian culture is another thing. A system is in its very nature at once an effectuation and a limitation of the spirit; and yet we must have a science and art of life, a system of living. All that is needed is that the lines laid down should be large and noble, capable of evolution so that the spirit may more and more express itself in life, flexible even in its firmness so that it may absorb and harmonise new material and enlarge its variety and richness without losing its unity. The system of Indian culture was all these things in its principle and up to a certain point and a certain period in its practice. That a decline came upon it in the end and a kind of arrest of growth, not absolute, but still very serious and dangerous to its life and future, is perfectly true, and we shall have to ask whether that was due to the inherent character of the culture, to a deformation or to a temporary exhaustion of the force of living, and, if the last, how that exhaustion came. At present, I will only note in passing one point which has its importance. Our critic is never tired of harping on India's misfortunes and he attributes them

all to the incurable badness of our civilisation, the total absence of a true and sound culture. Now misfortune is not a proof of absence of culture, nor good fortune the sign of salvation. Greece was unfortunate; she was as much torn by internal dissensions and civil wars as India, she was finally unable to arrive at unity or preserve independence; yet Europe owes half its civilisation to those squabbling inconsequent petty peoples of Greece. Italy was unfortunate enough in all conscience, yet few nations have contributed more to European culture than incompetent and unfortunate Italy. The misfortunes of India have been considerably exaggerated, at least in their incidence, but take them at their worst, admit that no nation has suffered more. If all that is due to the badness of our civilisation, to what is due then the remarkable fact of the obstinate survival of India, her culture and her civilisation under this load of misfortunes, or the power which enables her still to assert herself and her spirit at this moment, to the great wrath of her critics, against the tremendous shock of the flood from Europe which has almost submerged other peoples? If her misfortunes are due to her cultural deficiencies, must not by a parity of reasoning this extraordinary vitality be due to some great force in her, some enduring virtue of truth in her spirit? A mere lie and insanity cannot live; its persistence is a disease which must before long lead to death; it cannot be the source of an unslayable life. There must be some heart of soundness, some saving truth which has kept this people alive and still enables it to raise its head and affirm its will to be and its faith in its mission.

But, finally, we have to see not only the spirit and principle of the culture, not only the ideal idea and scope of intention in its system, but its actual working and effect in the values of life. Here we must admit great limitations, great imperfections. There is no culture, no civilisation ancient or modern which in its system has been entirely satisfactory to the need of perfection in man; there is none in which the working has not been marred by considerable limitations and imperfections. And the greater the aim of the culture, the larger the body of the civilisation, the more are these flaws likely to overbear the eye. In the first place

every culture suffers by the limitations or defects of its qualities and, an almost infallible consequence, by the exaggerations too of its qualities. It tends to concentrate on certain leading ideas and to lose sight of others or unduly depress them; this want of balance gives rise to one-sided tendencies which are not properly checked, not kept in their due place, and bring about unhealthy exaggerations. But so long as the vigour of the civilisation lasts, life accommodates itself, makes the most of compensating forces and in spite of all stumblings, evils, disasters some great thing is done; but in a time of decline the defect or the excess of a particular quality gets the upper hand, becomes a disease, makes a general ravage and, if not arrested, may lead to decay and death. Again, the ideal may be great, may have even, as Indian culture had in its best times, a certain kind of provisional completeness, a first attempt at comprehensive harmony, but there is always a great gulf between the ideal and the actual practice of life. To bridge that gulf or at least to make it as narrow as possible is the most difficult part of human endeavour. Finally, the evolution of our race, surprising enough if we look across the ages, is still, when all is said, a slow and embarrassed progress. Each age, each civilisation carries the heavy burden of our deficiencies, each succeeding age throws off something of the load, but loses some virtue of the past, creates other gaps and embarrasses itself with new aberrations. We have to strike a balance, to see things in the whole, to observe whither we are tending and use a large secular vision; otherwise it would be difficult to keep an unfailing faith in the destinies of the race. For, after all, what we have accomplished so far in the main at the best of times is to bring in a modicum of reason and culture and spirituality to leaven a great mass of barbarism. Mankind is still no more than semi-civilised and it was never anything else in the recorded history of its present cycle.

And therefore every civilisation presents a mixed and anomalous appearance and can be turned by a hostile or unsympathetic observation which notes and exaggerates its defects, ignores its true spirit and its qualities, masses the shades, leaves out the lights, into a mass of barbarism, a picture of almost

unrelieved gloom and failure, to the legitimate surprise and indignation of those to whom its motives appear to have a great and just value. For each has achieved something of special value for humanity in the midst of its general work of culture, brought out in a high degree some potentiality of our nature and given a first large standing-ground for its future perfection. Greece developed to a high degree the intellectual reason and the sense of form and harmonious beauty, Rome founded firmly strength and power and patriotism and law and order, modern Europe has raised to enormous proportions practical reason, science and efficiency and economic capacity, India developed the spiritual mind working on the other powers of man and exceeding them, the intuitive reason, the philosophical harmony of the Dharma informed by the religious spirit, the sense of the eternal and the infinite. The future has to go on to a greater and more perfect comprehensive development of these things and to evolve fresh powers, but we shall not do this rightly by damning the past or damning other cultures than our own in a spirit of arrogant intolerance. We need not only a spirit of calm criticism, but an eye of sympathetic intuition to extract the good from the past and present effort of humanity and make the most of it for our future progress.

This being so, if our critic insists that the past culture of India was of the nature of a semi-barbarism, I shall not object, so long as I have the liberty of passing the same criticism, equally valid or invalid, on the type of European culture which he wishes to foist on us in its place. Mr. Archer feels the openings which European civilisation gives to this kind of retort and he pleads plaintively that it ought not to be made; he takes refuge in the old tag that a *tu quoque* is no argument. Certainly the retort would be irrelevant if this were only a question of the dispassionate criticism of Indian culture without arrogant comparisons and offensive pretensions. But it becomes a perfectly valid and effective argument when the critic turns into a partisan and tries to trample underfoot all the claims of the Indian spirit and its civilisation in the name of the superiority of Europe. When he insists on our renouncing our own natural being and culture

in order to follow and imitate the West as docile pupils on the ground of India's failure to achieve cultural perfection or the ideal of a sound civilisation, we have a right to point out that Europe has to its credit at least as ugly a failure, and for the same fundamental reasons. We have a right to ask whether science, practical reason and efficiency and an unbridled economic production which makes man a slave of his life and body, a wheel, spring or cog in a huge mechanism or a cell of an economic organism and translates into human terms the ideal of the ant-hill and the bee-hive, is really the whole truth of our being and a sound or complete ideal of civilisation. The ideal of this culture, though it has its obstacles and difficulties, is at any rate not an unduly exalted aim and ought to be more easy of accomplishment than the arduous spiritual ideal of ancient India. But how much of the European mind and life is really governed by reason and what does this practical reason and efficiency come to in the end? To what perfection has it brought the human mind and soul and life? The aggressive ugliness of modern European life, its paucity of philosophic reason and aesthetic beauty and religious aspiration, its constant unrest, its harsh and oppressive mechanical burden, its lack of inner freedom, its recent huge catastrophe, the fierce struggle of classes are things of which we have a right to take note. To harp in the style of the Archerian lyre on these aspects alone and to ignore the brighter side of modern ideals would certainly be an injustice. There was a time indeed many years ago, when, while admiring the past cultural achievement of Europe, the present industrial form of it seemed to me an intellectualised Titanic barbarism with Germany as its too admired type and successful protagonist. A wider view of the ways of the Spirit in the world corrects the one-sidedness of this notion, but still it contains a truth which Europe recognised in the hour of her agony, though now she seems to be forgetting too easily her momentary illumination. Mr. Archer argues that at least the West is trying to struggle out of its barbarism while India has been content to stagnate in her deficiencies. That may be a truth of the immediate past; but what then? The question still remains whether Europe is taking the only, the complete or

the best way open to human endeavour and whether it is not the right thing for India, not to imitate Europe, though she well may learn from Western experience, but to get out of her stagnation by developing what is best and most essential in her own spirit and culture.

The right, the natural path for India lies so obviously in this direction that in order to destroy it Mr. Archer in his chosen role as devil's advocate has to juggle with the truth at every step and labour hard and vainly to reestablish the spell of hypnotic suggestion, now broken for good, which led most of us for a long space to condemn wholesale ourselves and our past and imagine that the Indian's whole duty in life was to turn an imitative ape in leading-strings and dance to the mechanic barrel-organ tunes of the British civiliser. The claim of Indian culture to survival can be met first and most radically by challenging the value of its fundamental ideas and the high things which are most native to its ideal, its temperament, its way of looking at the world. To deny the truth or the value of spirituality, of the sense of the eternal and infinite, the inner spiritual experience, the philosophic mind and spirit, the religious aim and feeling, the intuitive reason, the idea of universality and spiritual unity is one resource, and this is the real attitude of our critic which emerges constantly in his vehement philippic. But he cannot carry it through consistently, because it brings him into conflict with ideas and perceptions which are ineradicable in the human mind and which even in Europe are now after a temporary obscuration beginning to come back into favour. Therefore he hedges and tries rather to prove that we find in India, even in her magnificent past, even at her best, no spirituality, no real philosophy, no true or high religious feeling, no light of intuitive reason, nothing at all of the great things to which she has directed her most strenuous aspiration. This assertion is sufficiently absurd, self-contradictory and opposed to the express testimony of those who are eminently fitted and entitled to express an authoritative opinion on these matters. He therefore establishes a third line of attack combined of two inconsistent and opposite assertions, first, that the higher Hinduism which is made up of

these greater things has had no effect on India and, secondly, that it has had on the contrary a most all-pervading, a most disastrous and paralysing, a soul-killing, life-killing effect. He attempts to make his indictment effective by massing together all these inconsistent lines of attack and leading them all to the one conclusion, that the culture of India is both in theory and practice wrong, worthless, deleterious to the true aim of human living.

The last position taken is the only one which we need now consider, since the value of the essential ideas of Indian culture cannot be destroyed and to deny them is futile. The things they stand for are there, in whatever form, vaguely or distinctly seeking for themselves in the highest and deepest movements of human being and its nature. The peculiarity of Indian culture lies only in this distinction that what is vague or confused or imperfectly brought out in most other cultures, it has laboured rather to make distinct, to sound all its possibilities, to fix its aspects and lines and hold it up as a true, precise, large and practicable ideal for the race. The formulation may not be entirely complete; it may have to be still more enlarged, bettered, put otherwise, things missed brought out, the lines and forms modified, errors of stress and direction corrected; but a firm, a large foundation has been laid down not only in theory, but in solid practice. If there has been an actual complete failure in life,—and that is the one point left,—it must be due to one of two causes; either there has been some essential bungling in the application of the ideal to the facts of life as it is, or else there has been a refusal to recognise the facts of life at all. Perhaps, then, there has been, to put it otherwise, an insistence on what we may be at some hardly attainable height of our being without having first made the most of what we are. The infinite can only be reached after we have grown in the finite, the eternal grasped only by man growing in time, the spiritual perfected only by man accomplished first in body, life and mind. If that necessity has been ignored, then one may fairly contend that there has been a gross, impracticable and inexcusable error in the governing idea of Indian culture. But as a matter of fact there has been no such

error. We have seen what were the aim and idea and method of Indian culture and it will be perfectly clear that the value of life and its training were amply recognised in its system and given their proper place. Even the most extreme philosophies and religions, Buddhism and Illusionism, which held life to be an impermanence or ignorance that must be transcended and cast away, yet did not lose sight of the truth that man must develop himself under the conditions of this present ignorance or impermanence before he can attain to knowledge and to that Permanent which is the denial of temporal being. Buddhism was not solely a cloudy sublimation of Nirvana, nothingness, extinction and the tyrannous futility of Karma; it gave us a great and powerful discipline for the life of man on earth. The enormous positive effects it had on society and ethics and the creative impulse it imparted to art and thought and in a less degree to literature, are a sufficient proof of the strong vitality of its method. If this positive turn was present in the most extreme philosophy of denial, it was still more largely present in the totality of Indian culture.

There has been indeed from early times in the Indian mind a certain strain, a tendency towards a lofty and austere exaggeration in the direction taken by Buddhism and Mayavada. This excess was inevitable, the human mind being what it is; it had even its necessity and value. Our mind does not arrive at the totality of truth easily and by one embracing effort; an arduous search is the condition of its finding. The mind opposes different sides of the truth to each other, follows each to its extreme possibility, treats it even for a time as the sole truth, makes imperfect compromises, arrives by various adjustments and gropings nearer to the true relations. The Indian mind followed this method; it covered, as far as it could, the whole field, tried every position, looked at the truth from every angle, attempted many extremes and many syntheses. But the European critic very ordinarily labours under the idea that this exaggeration in the direction of negating life was actually the whole of Indian thought and sentiment or the one undisputed governing idea of the culture. Nothing could be more false and

inaccurate. The early Vedic religion did not deny, but laid a full emphasis on life. The Upanishads did not deny life, but held that the world is a manifestation of the Eternal, of Brahman, all here is Brahman, all is in the Spirit and the Spirit is in all, the self-existent Spirit has become all these things and creatures; life too is Brahman, the life-force is the very basis of our existence, the life-spirit Vayu is the manifest and evident Eternal, *pratyakṣam brahma*. But it affirmed that the present way of existence of man is not the highest or the whole; his outward mind and life are not all his being; to be fulfilled and perfect he has to grow out of his physical and mental ignorance into spiritual self-knowledge.

Buddhism arrived at a later stage and seized on one side of these ancient teachings to make a sharp spiritual and intellectual opposition between the impermanence of life and the permanence of the Eternal which brought to a head and made a gospel of the ascetic exaggeration. But the synthetic Hindu mind struggled against this negation and finally threw out Buddhism, though not without contracting an increased bias in this direction. That bias came to its height in the philosophy of Shankara, his theory of Maya, which put its powerful imprint on the Indian mind and, coinciding with a progressive decline in the full vitality of the race, did tend for a time to fix a pessimistic and negative view of terrestrial life and distort the larger Indian ideal. But his theory is not at all a necessary deduction from the great Vedantic authorities, the Upanishads, Brahmasutras and Gita, and was always combated by other Vedantic philosophies and religions which drew from them and from spiritual experience very different conclusions. At the present time, in spite of a temporary exaltation of Shankara's philosophy, the most vital movements of Indian thought and religion are moving again towards the synthesis of spirituality and life which was an essential part of the ancient Indian ideal. Therefore Mr. Archer's contention that whatever India has achieved in life and creation and action has been done in spite of the governing ideas of her culture, since logically she ought to have abandoned life and creation and action, is as unsound as it is unnatural and grotesque. To develop to the full the intellectual, the dynamic

and volitional, the ethical, the aesthetic, the social and economic being of man was an important element of Indian civilisation, — if for nothing else, at least as an indispensable preliminary to spiritual perfection and freedom. India's best achievements in thought, art, literature, society were the logical outcome of her religio-philosophical culture.

But still it may be argued that whatever may have been the theory, the exaggeration was there and in practice it discouraged life and action. That, when its other falsities have been eliminated, is what Mr. Archer's criticism comes to in the end; the emphasis on the Self, the eternal, the universal, the impersonal, the infinite discouraged, he thinks, life, will, personality, human action and led to a false and life-killing asceticism. India achieved nothing of importance, produced no great personalities, was impotent in will and endeavour, her literature and art are a barbaric and monstrous nullity not equal even to the third-rate work of Europe, her life story a long and dismal record of incompetence and failure. An inconsistency more or less is nothing to this critic and in the same breath he affirms that this very India, described by him elsewhere as always effete, sterile or a mother of monstrous abortions, is one of the most interesting countries in the world, that her art casts a potent and attractive spell and has numberless beauties, that her very barbarisms are magnificent and that, most wonderful of all, in presence of some of her personalities in the abodes of her ancient fine-spun aristocratic culture a European is apt to feel like a semi-barbarian intruder! But let us leave aside these signs of grace which are only an occasional glimmering of light across the darkness and gloom of Mr. Archer's mood. We must see how far there is any foundation for the substance of this criticism. What was the real value of Indian life, will, personality, achievement, creation, those things that she regards as her glories, but her critic tells her she should shudder at as her disgrace? That is the one remaining vital question.

Indian Spirituality and Life – 5

THE MOST general charge against Indian culture in its practical effects can be dismissed without any serious difficulty. The critic with whom I have to deal has, in fact, spoiled his case by the spirit of frantic exaggeration in which he writes. To say that there has been no great or vivid activity of life in India, that she has had no great personalities with the mythical exception of Buddha and the other pale exception of Asoka, that she has never shown any will-power and never done any great thing, is so contrary to all the facts of history that only a devil's advocate in search of a case could advance it at all or put it with that crude vehemence. India has lived and lived greatly, whatever judgment one may pass on her ideas and institutions. What is meant after all by life and when is it that we most fully and greatly live? Life is surely nothing but the creation and active self-expression of man's spirit, powers, capacities, his will to be and think and create and love and do and achieve. When that is wanting or, since it cannot be absolutely wanting, depressed, held under, discouraged or inert, whether by internal or external causes, then we may say that there is a lack of life. Life in its largest sense is the great web of our internal and external action, the play of Shakti, the play of Karma; it is religion and philosophy and thought and science and poetry and art, drama and song and dance and play, politics and society, industry, commerce and trade, adventure and travel, war and peace, conflict and unity, victory and defeat and aspirations and vicissitudes, the thoughts, emotions, words, deeds, joys and sorrows which make up the existence of man. In a narrower sense life is sometimes spoken of as the more obvious and external vital action, a thing which can be depressed by a top-heavy intellectuality or ascetic spirituality, sickled over with the pale cast of thought or the paler cast of world-weariness or made

flat, stale and uninteresting by a formalised, conventional or too strait-laced system of society. Again, life may be very active and full of colour for a small and privileged part of the community, but the life of the mass dull, void and miserable. Or, finally, there may be all the ordinary materials and circumstances of mere living, but if life is not uplifted by great hopes, aspirations and ideals, then we may well say that the community does not really live; it is defective in the characteristic greatness of the human spirit.

The ancient and mediaeval life of India was not wanting in any of the things that make up the vivid interesting activity of human existence. On the contrary, it was extraordinarily full of colour and interest. Mr. Archer's criticism on this point, a criticism packed full of ignorance and built up by a purely fictitious construction of what things logically ought to have been on the theory of a dominating asceticism and belief in the illusionary character of the world, is not and cannot be borne out by anyone who has come close to the facts. It is true that while many European writers who have studied the history of the land and the people, have expressed strongly their appreciation of the vividness and interesting fullness, colour and beauty of life in India before the present period,—that unhappily exists no longer except in the pages of history and literature and the broken or crumbling fragments of the past,—those who see only from a distance or fix their eyes only on one aspect, speak of it often as a land of metaphysics, philosophies, dreams and brooding imaginations, and certain artists and writers are apt to write in a strain as if it were a country of the Arabian Nights, a mere glitter of strange hues and fancies and marvels. But on the contrary India has been as much a home of serious and solid realities, of a firm grappling with the problems of thought and life, of measured and wise organisation and great action as any other considerable centre of civilisation. The widely different view these perceptions express simply show the many-sided brilliance and fullness of her life. The colour and magnificence have been its aesthetic side; she has had great dreams and high and splendid imaginations, for that too is wanted for the completeness of our

living; but also deep philosophical and religious thinking, a wide and searching criticism of life, a great political and social order, a strong ethical tone and a persistent vigour of individual and communal living. That is a combination which means life in all its fullness, though deficient, it may be, except in extraordinary cases, in the more violent egoistic perversities and exaggerations which some minds seem to take for a proof of the highest vigour of existence.

In what field indeed has not India attempted, achieved, created, and in all on a large scale and yet with much attention to completeness of detail? Of her spiritual and philosophic achievement there can be no real question. They stand there as the Himalayas stand upon the earth in the phrase of Kalidasa, *prthivyā iva mānadarṇah*, "as if earth's measuring rod," mediating still between earth and heaven, measuring the finite, casting their plummet far into the infinite, plunging their extremities into the upper and lower seas of the superconscious and the subliminal, the spiritual and the natural being. But if her philosophies, her religious disciplines, her long list of great spiritual personalities, thinkers, founders, saints are her greatest glory, as was natural to her temperament and governing idea, they are by no means her sole glories, nor are the others dwarfed by their eminence. It is now proved that in science she went farther than any country before the modern era, and even Europe owes the beginning of her physical science to India as much as to Greece, although not directly but through the medium of the Arabs. And, even if she had only gone as far, that would have been sufficient proof of a strong intellectual life in an ancient culture. Especially in mathematics, astronomy and chemistry, the chief elements of ancient science, she discovered and formulated much and well and anticipated by force of reasoning or experiment some of the scientific ideas and discoveries which Europe first arrived at much later, but was able to base more firmly by her new and completer method. She was well-equipped in surgery and her system of medicine survives to this day and has still its value, though it declined intermediately in knowledge and is only now recovering its vitality.

In literature, in the life of the mind, she lived and built greatly. Not only has she the Vedas, Upanishads and Gita, not to speak of less supreme but still powerful or beautiful work in that field, unequalled monuments of religious and philosophic poetry, a kind in which Europe has never been able to do anything much of any great value, but that vast national structure, the Mahabharata, gathering into its cycle the poetic literature and expressing so completely the life of a long formative age, that it is said of it in a popular saying which has the justice if also the exaggeration of a too apt epigram, "What is not in this Bharata, is not in Bharatavarsha (India)," and the Ramayana, the greatest and most remarkable poem of its kind, that most sublime and beautiful epic of ethical idealism and a heroic semi-divine human life, and the marvellous richness, fullness and colour of the poetry and romance of highly cultured thought, sensuous enjoyment, imagination, action and adventure which makes up the romantic literature of her classical epoch. Nor did this long continuous vigour of creation cease with the loss of vitality by the Sanskrit tongue, but was paralleled and carried on in a mass of great or of beautiful work in her other languages, in Pali first and Prakrit, much unfortunately lost,¹ and Tamil, afterwards in Hindi, Bengali, Marathi and other tongues. The long tradition of her architecture, sculpture and painting speaks for itself, even in what survives after all the ruin of stormy centuries: whatever judgment may be formed of it by the narrower school of Western aesthetics,—and at least its fineness of execution and workmanship cannot be denied, nor the power with which it renders the Indian mind,—it testifies at least to a continuous creative activity. And creation is proof of life and great creation of greatness of life.

But these things are, it may be said, the things of the mind, and the intellect, imagination and aesthetic mind of India may have been creatively active, but yet her outward life depressed, dull, poor, gloomy with the hues of asceticism, void of will-power and personality, ineffective, null. That would be a hard

¹ E.g. the once famous work in Paisachi of which the *Kathasaritsagara* is an inferior version.

proposition to swallow; for literature, art and science do not flourish in a void of life. But here too what are the facts? India has not only had the long roll of her great saints, sages, thinkers, religious founders, poets, creators, scientists, scholars, legislators; she has had her great rulers, administrators, soldiers, conquerors, heroes, men with the strong active will, the mind that plans and the seeing force that builds. She has warred and ruled, traded and colonised and spread her civilisation, built polities and organised communities and societies, done all that makes the outward activity of great peoples. A nation tends to throw out its most vivid types in that line of action which is most congenial to its temperament and expressive of its leading idea, and it is the great saints and religious personalities that stand at the head in India and present the most striking and continuous roll-call of greatness, just as Rome lived most in her warriors and statesmen and rulers. The Rishi in ancient India was the outstanding figure with the hero just behind, while in later times the most striking feature is the long uninterrupted chain from Buddha and Mahavira to Ramanuja, Chaitanya, Nanak, Ramdas and Tukaram and beyond them to Ramakrishna and Vivekananda and Dayananda. But there have been also the remarkable achievements of statesmen and rulers, from the first dawn of ascertainable history which comes in with the striking figures of Chandragupta, Chanakya, Asoka, the Gupta emperors and goes down through the multitude of famous Hindu and Mahomedan figures of the middle age to quite modern times. In ancient India there was the life of republics, oligarchies, democracies, small kingdoms of which no detail of history now survives, afterwards the long effort at empire-building, the colonisation of Ceylon and the Archipelago, the vivid struggles that attended the rise and decline of the Pathan and Mogul dynasties, the Hindu struggle for survival in the south, the wonderful record of Rajput heroism and the great upheaval of national life in Maharashtra penetrating to the lowest strata of society, the remarkable episode of the Sikh Khalsa. An adequate picture of that outward life still remains to be given; once given it would be the end of many fictions. All this

mass of action was not accomplished by men without mind and will and vital force, by pale shadows of humanity in whom the vigorous manhood had been crushed out under the burden of a gloomy and all-effacing asceticism, nor does it look like the sign of a metaphysically minded people of dreamers averse to life and action. It was not men of straw or lifeless and will-less dummies or thin-blooded dreamers who thus acted, planned, conquered, built great systems of administration, founded kingdoms and empires, figured as great patrons of poetry and art and architecture or, later, resisted heroically imperial power and fought for the freedom of clan or people. Nor was it a nation devoid of life which maintained its existence and culture and still lived on and broke out constantly into new revivals under the ever increasing stress of continuously adverse circumstances. The modern Indian revival, religious, cultural, political, called now sometimes a renaissance, which so troubles and grieves the minds of her critics, is only a repetition under altered circumstances, in an adapted form, in a greater though as yet less vivid mass of movement, of a phenomenon which has constantly repeated itself throughout a millennium of Indian history.

And it must be remembered that by virtue of its culture and its system the whole nation shared in the common life. In all countries in the past the mass has indeed lived with a less active and vivid force than the few,—sometimes with the mere elements of life, not with even any beginning of finished richness,—nor has modern civilisation yet got rid of this disparity, though it has opened the advantages or at least the initial opportunities of a first-hand life and thought and knowledge to a greater number. But in ancient India, though the higher classes led and had the lion's share of the force and wealth of life, the people too lived and until much later times intensely though on a lesser scale and with a more diffused and less concentrated force. Their religious life was more intense than that of any other country; they drank in with remarkable facility the thoughts of the philosophers and the influence of the saints; they heard and followed Buddha and the many who came after him; they were taught by the Sannyasins and sang the songs of the Bhaktas and

Bauls and thus possessed some of the most delicate and beautiful poetical literature ever produced; they contributed many of the greatest names in our religion, and from the outcastes themselves came saints revered by the whole community. In ancient Hindu times they had their share of political life and power; they were the people, the *viśāḥ* of the Veda, of whom the kings were the leaders and from them as well as from the sacred or princely families were born the Rishis; they held their villages as little self-administered republics; in the time of the great kingdoms and empires they sat in the municipalities and urban councils and the bulk of the typical royal Council described in the books of political science was composed of commoners, Vaishyas, and not of Brahmin Pundits and Kshatriya nobles; for a long time they could impose their will on their kings, without the need of a long struggle, by a single demonstration of their displeasure. So long as Hindu kingdoms existed, something of all this survived, and even the entrance into India of central Asian forms of absolutist despotism, never an indigenous Indian growth, left some remnant of the old edifice still in being. The people had their share too in art and poetry, their means by which the essence of Indian culture was disseminated through the mass, a system of elementary education in addition to the great universities of ancient times, a type of popular dramatic representation which was in some parts of the country alive even yesterday; they gave India her artists and architects and many of the famous poets in the popular tongues; they preserved by the force of their long past culture an innate aesthetic sense and faculty of which the work of Indian craftsmen remained a constant and striking evidence until it was destroyed or degraded by the vulgarisation and loss of aesthetic sense and beauty which has been one of the results of modern civilisation. Nor was the life of India ascetic, gloomy or sad, as the too logical mind of the critic would have it be. The outward form is more quiet than in other countries, there is a certain gravity and reserve before strangers which deceives the foreign observer, and in recent times asceticism and poverty and an increase of puritanic tendency had their effect, but the life portrayed in the literature of the country is glad and

vivid, and even now despite certain varieties of temperament and many forces making for depression laughter, humour, an unobtrusive elasticity and equanimity in the vicissitudes of life are very marked features of the Indian character.

The whole theory of a want of life and will and activity in the Indian people as a result of their culture is then a myth. The circumstances which have given some colour to it in later times will be noted in their proper place; but they are a feature of the decline and even then must be taken with considerable qualification, and the much longer history of its past greatness tells quite another story. That history has not been recorded in the European fashion; for the art of history and biography, though not entirely neglected, was never brought to perfection in India, never sufficiently practised, nor does any sustained record of the doings of kings and great men and peoples before the Mussulman dynasties survive except in the one solitary instance of Cashmere. This is certainly a defect and leaves a very serious gap. India has lived much, but has not sat down to record the history of her life. Her soul and mind have left their great monuments, but so much as we know—and after all it is not little—of the rest, the more outward things, remains or has emerged recently in spite of her neglect; such exact records as she had, she has allowed to rust forgotten or disappear. Perhaps what Mr. Archer really means when he tells us that we have had no personalities in our history, is that they do not come home to his mind because their doings and sayings are not minutely recorded in the Western manner; their personality, will-power and creative force emerge only in their work or in indicative tradition and anecdote or in incomplete records. And very curiously, very fancifully this defect has been set down to an ascetic want of interest in life; it is supposed that India was so much absorbed in the eternal that she deliberately despised and neglected time, so profoundly concentrated on the pursuit of ascetic brooding and quietistic peace that she looked down on and took no interest in the memory of action. That is another myth. The same phenomenon of a lack of sustained and deliberate record appears in other ancient cultures, but nobody

suggests that Egypt, Assyria or Persia have to be reconstructed for us by the archaeologists for an analogous reason. The genius of Greece developed the art of history, though only in the later period of her activity, and Europe has cherished and preserved the art; India and other ancient civilisations did not arrive at it or neglected its full development. It is a defect, but there is no reason why we should go out of our way in this one case to attribute it to a deliberate motive or to any lack of interest in life. And in spite of the defect the greatness and activity of the past life of India reveals itself and comes out in bolder relief the more the inquiry into her past unearths the vast amount of material still available.

But our critic will still have it that India lived as it were in spite of herself and that in all this teeming action there is ample evidence of the dwarfing of individual will and the absence of any great individual personality. He arrives at that result by methods which savour of the skill of the journalist or pamphleteer rather than the disinterested mind of the critic. He tells us for instance that India has contributed only one or at most two great names to the world's Pantheon. By that, of course, he means Europe's Pantheon, or the world's Pantheon as constructed by the mind of Europe, crammed with the figures of Western history and achievement which are near and familiar to it and admitting only a very few of the more gigantic names from the distant East, those which it finds it most difficult to ignore. One remembers the list made by a great French poet in the field of literature in which a sounding string of French names equals or outnumbers the whole contribution of the rest of Europe! If an Indian were to set about the same task in the same spirit, he would no doubt similarly pour out an interminable list of Indian names with some great men of Europe and America, Arabia, Persia, China, Japan forming a brief tail to this large peninsular body. These exercises of the partial mentality have no value. And it is difficult to find out what measure of values Mr. Archer is using when he relegates other great Indian names, allowing for three or four only, to the second plan and even there belittles them in comparison with corresponding European immortals. In what

is Shivaji with his vivid and interesting life and character, who not only founded a kingdom but organised a nation, inferior to Cromwell, or Shankara whose great spirit in the few years of its mortal life swept triumphant through India and reconstituted the whole religious life of her peoples, inferior as a personality to Luther? Why are Chanakya and Chandragupta who laid down the form of empire-building in India and whose great administrative system survived with changes often for the worse down to modern times, lesser men than the rulers and statesmen of European history? India may not present any recorded moment of her life so crowded as the few years of Athens to which Mr. Archer makes appeal; she may have no parallel to the swarm of interesting but often disturbing, questionable or even dark and revolting figures which illuminate and stain the story of the Italian cities during the Renaissance, although she has had too her crowded moments thronged by figures of a different kind. But she has had many rulers, statesmen and encouragers of art as great in their own way as Pericles or Lorenzo di Medici; the personalities of her famed poets emerge more dimly through the mist of time, but with indications which point to a lofty spirit or a humanity as great as that of Aeschylus or Euripides or a life-story as human and interesting as that of the famous Italian poets. And if, comparing this one country with all Europe as Mr. Archer insists, — mainly on the ground that Indians themselves make the comparison when they speak of the size of the country, its many races and the difficulty so long experienced in organising Indian unity, — it may be that in the field of political and military action Europe has a long lead, but what of the unparalleled profusion of great spiritual personalities in which India is preeminent? Again Mr. Archer speaks with arrogant depreciation of the significant figures born of the creative Indian mind which people its literature and its drama. Here too it is difficult to follow him or to accept his measure of values. To an oriental mind at least Rama and Ravana are as vivid and great and real characters as the personalities of Homer and Shakespeare, Sita and Draupadi certainly not less living than Helen or Cleopatra, Damayanti and Shakuntala and other feminine types not less

sweet, gracious and alive than Alcestis or Desdemona. I am not here affirming any superiority, but the bottomless inequality and inferiority which this critic affirms exists, not in truth, but only in his imagination or his way of seeing.

That perhaps is the one thing of significance, the one thing which is really worth noting, the difference of mentality which is at the bottom of these comparisons. There is not any inferiority of life or force or active and reactive will but, as far as the sameness of human nature allows, a difference of type, character, personality, let us say, an emphasis in different and almost opposite directions. Will-power and personality have not been wanting in India, but the direction preferably given to them and the type most admired are of a different kind. The average European mind is prone to value or at least to be more interested in the egoistic or self-asserting will which insists upon itself with a strong or a bold, an aggressive, sometimes a fierce insistence; the Indian mind not only prizes more from the ethical standpoint, — that is found everywhere, — but is more vividly interested in the calm, self-controlling or even the self-effacing personality; for the effacement of egoism seems to it to be not an effacement, but an enhancement of value and power of the true person and its greatness. Mr. Archer finds Asoka pale and featureless; to an Indian mind he is supremely vivid and attractive. Why is Asoka to be called pale in comparison with Charlemagne or, let us say, with Constantine? Is it because he only mentions his sanguinary conquest of Kalinga in order to speak of his remorse and the turning of his spirit, a sentiment which Charlemagne massacring the Saxons in order to make good Christians of them could not in the least have understood, nor any more perhaps the Pope who anointed him? Constantine gave the victory to the Christian religion, but there is nothing Christian in his personality; Asoka not only enthroned Buddhism, but strove though not with a perfect success to follow the path laid down by Buddha. And the Indian mind would account him not only a nobler will, but a greater and more attracting personality than Constantine or Charlemagne. It is interested in Chanakya, but much more interested in Chaitanya.

And in literature also just as in actual life it has the same turn. This European mind finds Rama and Sita uninteresting and unreal, because they are too virtuous, too ideal, too white in colour; but to the Indian mind even apart from all religious sentiment they are figures of an absorbing reality which appeal to the inmost fibres of our being. A European scholar criticising the Mahabharata finds the strong and violent Bhima the only real character in that great poem; the Indian mind on the contrary finds greater character and a more moving interest in the calm and collected heroism of Arjuna, in the fine ethical temperament of Yudhisthira, in the divine charioteer of Kurukshetra who works not for his own hand but for the founding of the kingdom of right and justice. Those vehement or self-asserting characters or those driven by the storm of their passions which make the chief interest of European epic and drama, would either be relegated by it to the second plan or else, if set in large proportions, so brought in in order to bring into relief the greatness of the higher type of personality, as Ravana contrasts with and sets off Rama. The admiration of the one kind of mentality in the aesthetics of life goes to the coloured, that of the other to the luminous personality. Or, to put it in the form of the distinction made by the Indian mind itself, the interest of the one centres more in the rajasic, that of the other in the sattwic will and character.

Whether this difference imposes an inferiority on the aesthetics of Indian life and creation, each must judge for himself, but surely the Indian is the more evolved and spiritual conception. The Indian mind believes that the will and personality are not diminished but heightened by moving from the rajasic or more coloured egoistic to the sattwic and more luminous level of our being. Are not after all calm, self-mastery, a high balance signs of a greater and more real force of character than mere self-assertion of strength of will or the furious driving of the passions? Their possession does not mean that one must act with an inferior or less puissant, but only with a more right, collected and balanced will. And it is a mistake to think that asceticism itself rightly understood and practised implies an effacement

of will; it brings much rather its greater concentration. That is the Indian view and experience and the meaning of the old legends in the epics — to which Mr. Archer, misunderstanding the idea behind them, violently objects,— attributing so enormous a force, even when it was misused, to the power gained by ascetic self-mastery, Tapasya. The Indian mind believed and still believes that soul power is a greater thing, works from a mightier centre of will and has greater results than a more outwardly and materially active will-force. But it will be said that India has valued most the impersonal and that must obviously discourage personality. But this too, — except for the negative ideal of losing oneself in the trance or the silence of the Eternal, which is not the true essence of the matter, — involves a misconception. However paradoxical it may sound, one finds actually that the acceptance of the eternal and impersonal behind one's being and action and the attempt at unity with it is precisely the thing that carries the person to his largest greatness and power. For this impersonality is not a nullity, but an oceanic totality of the being. The perfect man, the Siddha or the Buddha, becomes universal, embraces all being in sympathy and oneness, finds himself in others as in himself and by so doing draws into himself at the same time something of the infinite power of a universal energy. That is the positive ideal of Indian culture. And when this hostile critic finds himself forced to do homage to the superiority of certain personalities who have sprung from this "fine-spun aristocratic" culture, he is really paying a tribute to some results of this preference of the sattvic to the rajasic, the universal to the limited and egoistic man. Not to be as the common man, that is to say, as the crude natural or half-baked human being, was indeed the sense of this ancient endeavour and in that sense it may be called an aristocratic culture. But it was not a vulgar outward but a spiritual nobility which was the aim of its self-discipline. Indian life, personality, art, literature must be judged in this light and appreciated or depreciated after being seen in the real sense and with the right understanding of Indian culture.

XII

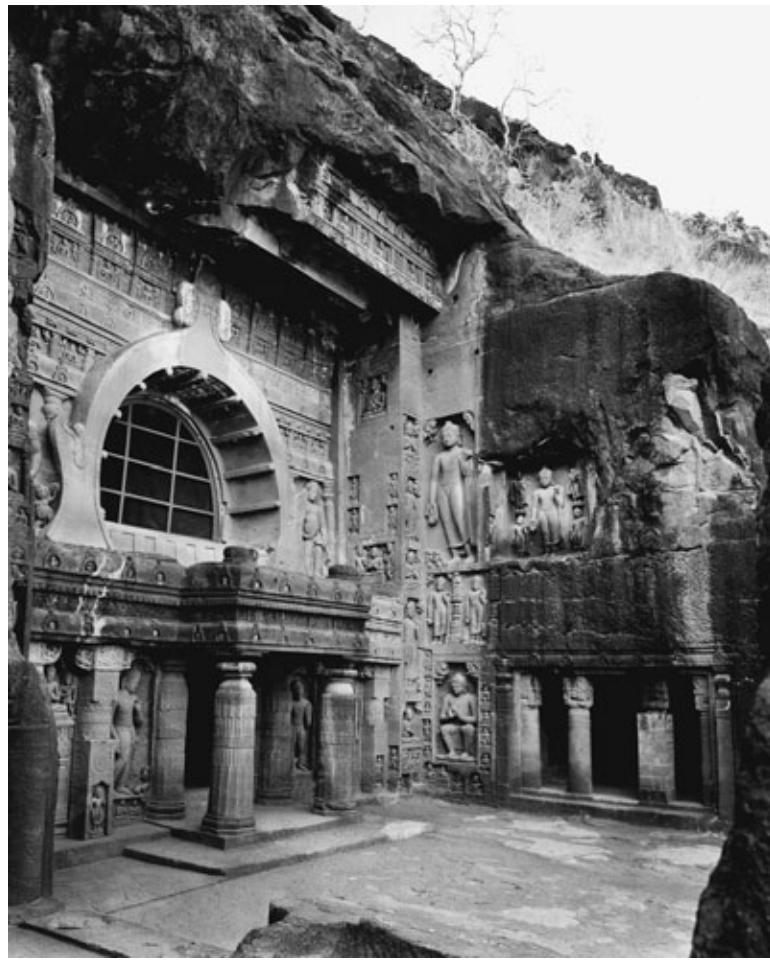

Indian Art

A GOOD deal of hostile or unsympathetic Western criticism of Indian civilisation has been directed in the past against its aesthetic side and taken the form of a disdainful or violent depreciation of its fine arts, architecture, sculpture and painting. Mr. Archer would not find much support in his wholesale and undiscriminating depreciation of a great literature, but here too there has been, if not positive attack, much failure of understanding; but in the attack on Indian art, his is the last and shrillest of many hostile voices. This aesthetic side of a people's culture is of the highest importance and demands almost as much scrutiny and carefulness of appreciation as the philosophy, religion and central formative ideas which have been the foundation of Indian life and of which much of the art and literature is a conscious expression in significant aesthetic forms. Fortunately, a considerable amount of work has been already done in the clearing away of misconceptions about Indian sculpture and painting and, if that were all, I might be content to refer to the works of Mr. Havell and Dr. Coomaraswamy or to the sufficiently understanding though less deeply informed and penetrating criticisms of others who cannot be charged with a prepossession in favour of oriental work. But a more general and searching consideration of first principles is called for in any complete view of the essential motives of Indian culture. I am appealing mainly to that new mind of India which long misled by an alien education, view and influence is returning to a sound and true idea of its past and future; but in this field the return is far from being as pervading, complete or luminous as it should be. I shall confine myself therefore first to a consideration of the sources of misunderstanding and pass from that to the true cultural significance of Indian aesthetic creation.

Mr. Archer pursuing his policy of Thorough devotes a whole

chapter to the subject. This chapter is one long torrent of sweeping denunciation. But it would be a waste of time to take his attack as serious criticism and answer all in detail. His reply to defenders and eulogists is amazing in its shallowness and triviality, made up mostly of small, feeble and sometimes irrelevant points, big glaring epithets and forcibly senseless phrases, based for the rest on a misunderstanding or a sheer inability to conceive the meaning of spiritual experiences and metaphysical ideas, which betrays an entire absence of the religious sense and the philosophic mind. Mr. Archer is of course a rationalist and contemner of philosophy and entitled to his deficiencies; but why then try to judge things into the sense of which one is unable to enter and exhibit the spectacle of a blind man discoursing on colours? I will cite one or two instances which will show the quality of his criticism and amply justify a refusal to attach any positive value to the actual points he labours to make, except for the light they throw on the psychology of the objectors.

I will give first an instance amazing in its ineptitude. The Indian ideal figure of the masculine body insists on two features among many, a characteristic width at the shoulders and slenderness in the middle. Well, an objection to broadness of girth and largeness of belly — allowed only where they are appropriate as in sculptures of Ganesha or the Yakshas — is not peculiar to the Indian aesthetic sense; an emphasis, even a pronounced emphasis on their opposites is surely intelligible enough as an aesthetic tradition, however some may prefer a more realistic and prosperous presentation of the human figure. But Indian poets and authorities on art have given in this connection the simile of the lion, and lo and behold Mr. Archer solemnly discoursing on this image as a plain proof that the Indian people were only just out of the semi-savage state! It is only too clear that they drew the ideal of heroic manhood from their native jungle, from theriolatry, that is to say, from a worship of wild beasts! I presume, on the same principle and with the same stupefying ingenuity he would find in Kamban's image of the sea for the colour and depth of Sita's eyes clear evidence of a still more primitive savagery and barbaric worship of inanimate

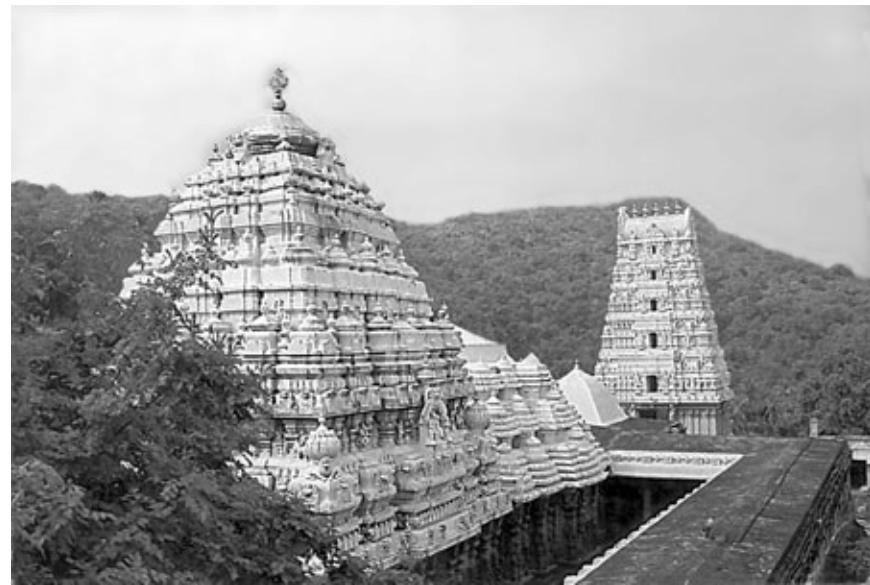

1. Cave Cathedral, Ajanta

The secular buildings of ancient India, her palaces and places of assembly and civic edifices have not outlived the ravage of time; what remains to us is mostly something of the great mountain and cave temples, something too of the temples of her ancient cities of the plains....(p. 272)

2. Kalahastishwara Temple, Andhra Pradesh

The straight way here is not to detach the temple from its surroundings, but to see it in unity with the sky and low-lying landscape or with the sky and hills around and feel the thing common to both, the construction and its environment, the reality in Nature, the reality expressed in the work of art.
(p.277)

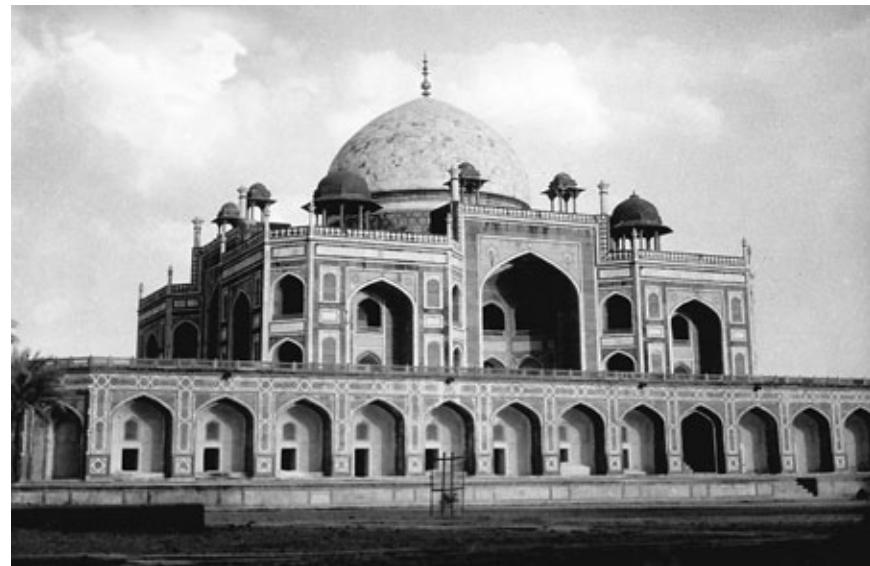

3. Sinhachalam Temple, Andhra Pradesh

One of these buildings climbs up bold, massive in projection, up-piled in the greatness of a forceful but sure ascent, preserving its range and line to the last, the other soars from the strength of its base, in the grace and emotion of a curving mass to a rounded summit and crowning symbol. (p. 277)

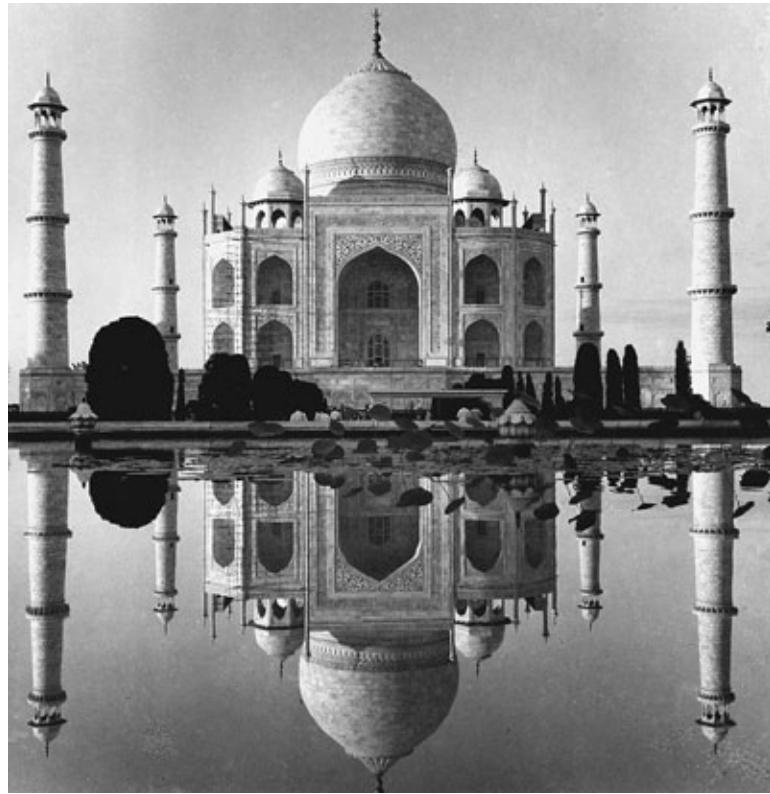

4. Kandarya Mahadeo Temple, Khajuraho

The great temples of the north have often ... a singular grace
in their power, a luminous lightness relieving their mass and
strength, a rich delicacy of beauty in their ornate fullness.
(p.280)

5. Humayun's Tomb, New Delhi

It seems to me that here the Indian mind has taken in much from the Arab and Persian imagination and in certain mosques and tombs I seem to find an impress of the robust and bold Afghan and Mogul temperament; but it remains clear enough that it is still on the whole a typically Indian creation with the peculiar Indian gift. (p. 282)

6. Taj Mahal, Agra

The Taj is not merely a sensuous reminiscence of an imperial amour or a fairy enchantment hewn from the moon's lucent quarries, but the eternal dream of a love that survives death.
(p.284)

7. Itimad-ud-Daulah's Tomb, Agra

Not rational but magical beauty satisfying and enchanting to some deeper quite suprarational aesthetic soul in us is the inexpressible charm of these creations. (p. 283)

8. Panch Mahal, Fatehpur Sikri

The buildings of Fatehpur-Sikri are not monuments of an effeminate luxurious decadence,—an absurd description for the mind of the time of Akbar,—but give form to a nobility, power and beauty which lay hold upon but do not wallow on the earth. (p. 284)

nature, or in Valmiki's description of his heroine's "eyes like wine", *madirekṣanā*, evidence of a chronic inebriety and the semi-drunken inspiration of the Indian poetic mind. This is one example of Mr. Archer's most telling points. It is by no means an isolated though it is an extreme specimen, and the absurdity of that particular argument only brings out the triviality of this manner of criticism. It is on a par with the common objection to the slim hands and feet loved of the Bengal painters which one hears sometimes advanced as a solid condemnation of their work. And that can be pardoned in the average man who under the high dispensation of modern culture is not expected to have any intelligent conception about art,—the instinctive appreciation has been already safely killed and buried. But what are we to say of a professed critic who ignores the deeper motives and fastens on details in order to give them this kind of significance?

But there are more grave and important objections in this criticism; for Mr. Archer turns also to deal with philosophy in art. The whole basis of Indian artistic creation, perfectly conscious and recognised in the canons, is directly spiritual and intuitive. Mr. Havell rightly lays stress on this essential distinction and speaks in passing of the infinite superiority of the method of direct perception over intellect, an assertion naturally offensive to the rationalistic mind, though it is now increasingly affirmed by leading Western thinkers. Mr. Archer at once starts out to hack at it with a very blunt tomahawk. How does he deal with this crucial matter? In a way which misses the whole real point and has nothing whatever to do with the philosophy of art. He fastens on Mr. Havell's coupling of the master intuition of Buddha with the great intuition of Newton and objects to the parallel because the two discoveries deal with two different orders of knowledge, one scientific and physical, the other mental or psychic, spiritual or philosophic in nature. He trots out from its stable the old objection that Newton's intuition was only the last step in a long intellectual process, while according to this positive psychologist and philosophic critic the intuitions of Buddha and other Indian sages had no basis in any intellectual process of any kind or any verifiable experience. It is on the

contrary the simple fact, well-known to all who know anything of the subject, that the conclusions of Buddha and other Indian philosophers (I am not now speaking of the inspired thought of the Upanishads which was pure spiritual experience enlightened by intuition and gnosis,) were preceded by a very acute scrutiny of relevant psychological phenomena and a process of reasoning which, though certainly not rationalistic, was as rational as any other method of thinking. He clinches his refutation by the sage remark that these intuitions which he chooses to call fantasies contradict one another and therefore, it seems, have no sort of value except their vain metaphysical subtlety. Are we to conclude that the patient study of phenomena, the scrupulous and rigidly verifiable intellectual reasonings and conclusions of Western scientists have led to no conflicting or contradictory results? One could never imagine at this rate that the science of heredity is torn by conflicting "fantasies" or that Newton's "fantasies" about space and gravitational effect on space are at this day in danger of being upset by Einstein's "fantasies" in the same field. It is a minor matter that Mr. Archer happens to be wrong in his idea of Buddha's intuition when he says that he would have rejected a certain Vedantic intuition, since Buddha neither accepted nor rejected, but simply refused at all to speculate on the supreme cause. His intuition was confined to the cause of sorrow and the impermanence of things and the release by extinction of ego, desire and Sanskara, and so far as he chose to go, his intuition of this extinction, Nirvana, and the Vedantic intuition of the supreme unity were the seeing of one truth of spiritual experience, seen no doubt from different angles of vision and couched in different intellectual forms, but with a common intuitive substance. The rest was foreign to Buddha's rigidly practical purpose. All this leads us far afield from our subject, but our critic has a remarkably confused mind and to follow him is to be condemned to divagate.

Thus far Mr. Archer on intuition. This is the character of his excursions on first principles in art. Is it really necessary to point out that a power of mind or spirit may be the same and yet act differently in different fields? or that a certain kind of intuition

may be prepared by a long intellectual training, but that does not make it a last step in an intellectual process, any more than the precedence of sense activity makes intellectual reasoning a last step of sense-perception? The reason overtops sense and admits us to other and subtler ranges of truth; the intuition similarly overtops reason and admits us to a more direct and luminous power of truth. But very obviously in the use of the intuition the poet and artist cannot proceed precisely in the same way as the scientist or philosopher. Leonardo da Vinci's remarkable intuitions in science and his creative intuitions in art started from the same power, but the surrounding or subordinate mental operations were of a different character and colour. And in art itself there are different kinds of intuition. Shakespeare's seeing of life differs in its character and aims from Balzac's or Ibsen's, but the essential part of the process, that which makes it intuitive, is the same. The Buddhistic, the Vedantic seeing of things may be equally powerful starting-points for artistic creation, may lead one to the calm of a Buddha or the other to the rapture dance or majestic stillness of Shiva, and it is quite indifferent to the purposes of art to which of them the metaphysician may be inclined to give a logical preference. These are elementary notions and it is not surprising that one who ignores them should misunderstand the strong and subtle artistic creations of India.

The weakness of Mr. Archer's attack, its empty noise and violence and exiguity of substance must not blind us to the very real importance of the mental outlook from which his dislike of Indian art proceeds. For the outlook and the dislike it generates are rooted in something deeper than themselves, a whole cultural training, natural or acquired temperament and fundamental attitude towards existence, and it measures, if the immeasurable can be measured, the width of the gulf which till recently separated the oriental and the Western mind and most of all the European and the Indian way of seeing things. An inability to understand the motives and methods of Indian art and a contempt of or repulsion from it was almost universal till yesterday in the mind of Europe. There was little

difference in this regard between the average man bound by his customary first notions and the competent critic trained to appreciate different forms of culture. The gulf was too wide for any bridge of culture then built to span. To the European mind Indian art was a thing barbarous, immature, monstrous, an arrested growth from humanity's primitive savagery and incompetent childhood. If there has been now some change, it is due to the remarkably sudden widening of the horizon and view of European culture, a partial shifting even of the standpoint from which it was accustomed to see and judge all that it saw. In matters of art the Western mind was long bound up as in a prison in the Greek and Renaissance tradition modified by a later mentality with only two side rooms of escape, the romantic and the realistic motives, but these were only wings of the same building; for the base was the same and a common essential canon united their variations. The conventional superstition of the imitation of Nature as the first law or the limiting rule of art governed even the freest work and gave its tone to the artistic and critical intelligence. The canons of Western artistic creation were held to be the sole valid criteria and everything else was regarded as primitive and half-developed or else strange and fantastic and interesting only by its curiosity. But a remarkable change has begun to set in, even though the old ideas still largely rule. The prison, if not broken, has at least had a wide breach made in it; a more flexible vision and a more profound imagination have begun to superimpose themselves on the old ingrained attitude. As a result, and as a contributing influence towards this change, oriental or at any rate Chinese and Japanese art has begun to command something like adequate recognition.

But the change has not yet gone far enough for a thorough appreciation of the deepest and most characteristic spirit and inspiration of Indian work. An eye or an effort like Mr. Havell's is still rare. For the most part even the most sympathetic criticism stops short at a technical appreciation and imaginative sympathy which tries to understand from outside and penetrates into so much only of the artistic suggestion

as can be at once seized by the new wider view of a more accomplished and flexible critical mentality. But there is little sign of the understanding of the very well-spring and spiritual fountain of Indian artistic creation. There is therefore still a utility in fathoming the depths and causes of the divergence. That is especially necessary for the Indian mind itself, for by the appreciation excited by an opposing view it will be better able to understand itself and especially to seize what is essential in Indian art and must be clung to in the future and what is an incident or a phase of growth and can be shed in the advance to a new creation. This is properly a task for those who have themselves at once the creative insight, the technical competence and the seeing critical eye. But everyone who has at all the Indian spirit and feeling, can at least give some account of the main, the central things which constitute for him the appeal of Indian painting, sculpture and architecture. This is all that I shall attempt, for it will be in itself the best defence and justification of Indian culture on its side of aesthetic significance.

The criticism of art is a vain and dead thing when it ignores the spirit, aim, essential motive from which a type of artistic creation starts and judges by the external details only in the light of a quite different spirit, aim and motive. Once we understand the essential things, enter into the characteristic way and spirit, are able to interpret the form and execution from that inner centre, we can then see how it looks in the light of other standpoints, in the light of the comparative mind. A comparative criticism has its use, but the essential understanding must precede it if it is to have any real value. But while this is comparatively easy in the wider and more flexible turn of literature, it is, I think, more difficult in the other arts, when the difference of spirit is deep, because there the absence of the mediating word, the necessity of proceeding direct from spirit to line and form brings about a special intensity and exclusive concentration of aim and stress of execution. The intensity of the thing that moves the work is brought out with a more distinct power, but by its very stress and directness allows of

few accommodations and combined variations of appeal. The thing meant and the thing done strike deep home into the soul or the imaginative mind, but touch it over a smaller surface and with a lesser multitude of points of contact. But whatever the reason, it is less easy for a different kind of mind to appreciate.

The Indian mind in its natural poise finds it almost or quite as difficult really, that is to say, spiritually to understand the arts of Europe, as the ordinary European mind to enter into the spirit of Indian painting and sculpture. I have seen a comparison made between a feminine Indian figure and a Greek Aphrodite which illustrates the difficulty in an extreme form. The critic tells me that the Indian figure is full of a strong spiritual sense—here of the very breath and being of devotion, an ineffable devotion, and that is true, it is a suggestion or even a revelation which breaks through or overflows the form rather than depends on the external work,—but the Greek creation can only awaken a sublimated carnal or sensuous delight. Now having entered somewhat into the heart of meaning of Greek sculpture, I can see that this is a wrong account of the matter. The critic has got into the real spirit of the Indian, but not into the real spirit of the Greek work; his criticism from that moment, as a comparative appreciation, loses all value. The Greek figure stresses no doubt the body, but appeals through it to an imaginative seeing inspiration which aims at expressing a certain divine power of beauty and gives us therefore something which is much more than a merely sensuous aesthetic pleasure. If the artist has done this with perfection, the work has accomplished its aim and ranks as a masterpiece. The Indian sculptor stresses something behind, something more remote to the surface imagination, but nearer to the soul, and subordinates to it the physical form. If he has only partially succeeded or done it with power but with something faulty in the execution, his work is less great, even though it may have a greater spirit in the intention: but when he wholly succeeds, then his work too is a masterpiece, and we may prefer it with a good conscience, if the spiritual, the higher intuitive vision is what we most demand from art. This however

need not interfere with an appreciation of both kinds in their own order.

But in viewing much of other European work of the very greatest repute, I am myself aware of a failure of spiritual sympathy. I look for instance on some of the most famed pieces of Tintoretto,— not the portraits, for those give the soul, if only the active or character soul in the man, but say, the Adam and Eve, the St. George slaying the dragon, the Christ appearing to Venetian Senators, and I am aware of standing baffled and stopped by an irresponsible blankness somewhere in my being. I can see the magnificence and power of colouring and design, I can see the force of externalised imagination or the spirited dramatic rendering of action, but I strive in vain to get out any significance below the surface or equivalent to the greatness of the form, except perhaps an incidental minor suggestion here and there and that is not sufficient for me. When I try to analyse my failure, I find at first certain conceptions which conflict with my expectation or my own way of seeing. This muscular Adam, the sensuous beauty of this Eve do not bring home to me the mother or the father of the race, this dragon seems to me only a surly portentous beast in great danger of being killed, not a creative embodiment of monstrous evil, this Christ with his massive body and benevolent philosophic visage almost offends me, is not at any rate the Christ whom I know. But these are after all incidental things; what is really the matter is that I come to this art with a previous demand for a kind of vision, imagination, emotion, significance which it cannot give me. And not being so self-confident as to think that what commands the admiration of the greatest critics and artists is not admirable, I can see this and pause on the verge of applying Mr. Archer's criticism of certain Indian work and saying that the mere execution is beautiful or marvellous but there is no imagination, nothing beyond what is on the surface. I can understand that what is wanting is really the kind of imagination I personally demand; but though my acquired cultured mind explains this to me and may intellectually catch at the something more, my natural being will not be satisfied,

I am oppressed, not uplifted by this triumph of life and the flesh and of the power and stir of life,—not that I object to these things in themselves or to the greatest emphasis on the sensuous or even the sensual, elements not at all absent from Indian creation, if I can get something at least of the deeper thing I want behind it,—and I find myself turning away from the work of one of the greatest Italian masters to satisfy myself with some “barbaric” Indian painting or statue, some calm unfathomable Buddha, bronze Shiva or eighteen-armed Durga slaying the Asuras. But the cause of my failure is there, that I am seeking for something which was not meant in the spirit of this art and which I ought not to expect from its characteristic creation. And if I had steeped myself in this Renaissance mind as in the original Hellenic spirit, I could have added something to my inner experience and acquired a more catholic and universal aesthesis.

I lay stress on this psychological misunderstanding or want of understanding, because it explains the attitude of the natural European mind to the great works of Indian art and puts on it its right value. This mind catches only what is kin to European effort and regards that too as inferior, naturally and quite rightly since the same thing is more sincerely and perfectly done from a more native fountain of power in Western work. That explains the amazing preference of better informed critics than Mr. Archer for the bastard Gandharan sculpture to great and sincere work original and true in its unity,—Gandharan sculpture which is an unsatisfying, almost an impotent junction of two incompatible motives, incompatible at least if one is not fused into the other as here certainly it is not fused,—or its praise otherwise incomprehensible of certain second-rate or third-rate creations and its turning away from others noble and profound but strange to its conceptions. Or else it seizes with appreciation—but is it really a total and a deeply understanding appreciation?—on work like the Indo-Saracenic which though in no way akin to Western types has yet the power at certain points to get within the outskirts of its circle of aesthetic conceptions. It is even so much struck by the Taj as to

try to believe that it is the work of an Italian sculptor, some astonishing genius, no doubt, who Indianised himself miraculously in this one hour of solitary achievement, for India is a land of miracles,—and probably died of the effort, for he has left us no other work to admire. Again it admires, at least in Mr. Archer, Javanese work because of its humanity and even concludes from that that it is not Indian. Its essential unity with Indian work behind the variation of manner is invisible to this mind because the spirit and inner meaning of Indian work is a blank to its vision and it sees only a form, a notation of the meaning, which, therefore, it does not understand and dislikes. One might just as well say that the Gita written in the Devanagari is a barbaric, monstrous or meaningless thing, but put into some cursive character at once becomes not Indian, because human and intelligible!

But, ordinarily, place this mind before anything ancient, Hindu, Buddhistic or Vedantic in art and it looks at it with a blank or an angry incomprehension. It looks for the sense and does not find any, because either it has not in itself the experience and finds it difficult to have the imagination, much more the realisation of what this art does really mean and express, or because it insists on looking for what it is accustomed to see at home and, not finding that, is convinced that there is nothing to see or nothing of any value. Or else if there is something which it could have understood, it does not understand because it is expressed in the Indian form and the Indian way. It looks at the method and form and finds it unfamiliar, contrary to its own canons, is revolted, contemptuous, repelled, speaks of the thing as monstrous, barbarous, ugly or null, passes on in a high dislike or disdain. Or if it is overborne by some sense of unanalysable beauty of greatness or power it still speaks of a splendid barbarism. Do you want an illuminating instance of this blankness of comprehension? Mr. Archer sees the Dhyani Buddha with its supreme, its unfathomable, its infinite spiritual calm which every cultured oriental mind can at once feel and respond to in the depths of his being, and he denies that there is anything,—only drooped eyelids, an

immobile pose and an insipid, by which I suppose he means a calm passionless face.¹ He turns for comfort to the Hellenic nobility of expression of the Gandharan Buddha, or to the living Rabindranath Tagore more spiritual than any Buddha from Peshawar to Kamakura, an inept misuse of comparison against which I imagine the great poet himself would be the first to protest. There we have the total incomprehension, the blind window, the blocked door in the mind, and there too the reason why the natural Western mentality comes to Indian art with a demand for something other than what its characteristic spirit and motive intend to give, and, demanding that, is not prepared to enter into another kind of spiritual experience and another range of creative sight, imaginative power and mode of self-expression.

This once understood, we can turn to the difference in the spirit and method of artistic creation which has given rise to the mutual incomprehension; for that will bring us to the positive side of the matter. All great artistic work proceeds from an act of intuition, not really an intellectual idea or a splendid imagination,—these are only mental translations,—but a direct intuition of some truth of life or being, some significant form of that truth, some development of it in the mind of man. And so far there is no difference between great European and great Indian work. Where then begins the immense divergence? It is there in everything else, in the object and field of the intuitive vision, in the method of working out the sight or suggestion, in the part taken in the rendering by the external form and technique, in the whole way of the rendering to the human mind, even in the centre of our being to which the work appeals. The European artist gets his intuition by a suggestion from an appearance in life and Nature or, if it starts from something

¹ In a note Mr. Archer mentions and very rightly discounts an absurd apology for these Buddhas, viz., that the greatness and spirituality are not at all in the work, but in the devotion of the artist! If the artist cannot put into his work what was in him—and here it is not devotion that is expressed,—his work is a futile abortion. But if he has expressed what he has felt, the capacity to feel it must also be there in the mind that looks at his work.

in his own soul, relates it at once to an external support. He brings down that intuition into his normal mind and sets the intellectual idea and the imagination in the intelligence to clothe it with a mental stuff which will render its form to the moved reason, emotion, aesthesis. Then he missions his eye and hand to execute it in terms which start from a colourable "imitation" of life and Nature — and in ordinary hands too often end there — to get at an interpretation that really changes it into the image of something not outward in our own being or in universal being which was the real thing seen. And to that in looking at the work we have to get back through colour and line and disposition or whatever else may be part of the external means, to their mental suggestions and through them to the soul of the whole matter. The appeal is not direct to the eye of the deepest self and spirit within, but to the outward soul by a strong awakening of the sensuous, the vital, the emotional, the intellectual and imaginative being, and of the spiritual we get as much or as little as can suit itself to and express itself through the outward man. Life, action, passion, emotion, idea, Nature seen for their own sake and for an aesthetic delight in them, these are the object and field of this creative intuition. The something more which the Indian mind knows to be behind these things looks out, if at all, from behind many veils. The direct and unveiled presence of the Infinite and its godheads is not evoked or thought necessary to the greater greatness and the highest perfection.

The theory of ancient Indian art at its greatest — and the greatest gives its character to the rest and throws on it something of its stamp and influence — is of another kind. Its highest business is to disclose something of the Self, the Infinite, the Divine to the regard of the soul, the Self through its expressions, the Infinite through its living finite symbols, the Divine through his powers. Or the Godheads are to be revealed, luminously interpreted or in some way suggested to the soul's understanding or to its devotion or at the very least to a spiritually or religiously aesthetic emotion. When this hieratic art comes down from these altitudes to the intermediate worlds behind ours, to the lesser godheads or genii, it still carries into them some power or some

hint from above. And when it comes quite down to the material world and the life of man and the things of external Nature, it does not altogether get rid of the greater vision, the hieratic stamp, the spiritual seeing, and in most good work — except in moments of relaxation and a humorous or vivid play with the obvious — there is always something more in which the seeing presentation of life floats as in an immaterial atmosphere. Life is seen in the self or in some suggestion of the infinite or of something beyond or there is at least a touch and influence of these which helps to shape the presentation. It is not that all Indian work realises this ideal; there is plenty no doubt that falls short, is lowered, ineffective or even debased, but it is the best and the most characteristic influence and execution which gives its tone to an art and by which we must judge. Indian art in fact is identical in its spiritual aim and principle with the rest of Indian culture.

A seeing in the self accordingly becomes the characteristic method of the Indian artist and it is directly enjoined on him by the canon. He has to see first in his spiritual being the truth of the thing he must express and to create its form in his intuitive mind; he is not bound to look out first on outward life and Nature for his model, his authority, his rule, his teacher or his fountain of suggestions. Why should he when it is something quite inward he has to bring out into expression? It is not an idea in the intellect, a mental imagination, an outward emotion on which he has to depend for his stimulants, but an idea, image, emotion of the spirit, and the mental equivalents are subordinate things for help in the transmission and give only a part of the colouring and the shape. A material form, colour, line and design are his physical means of the expression, but in using them he is not bound to an imitation of Nature, but has to make the form and all else significant of his vision, and if that can only be done or can best be done by some modification, some pose, some touch or symbolic variation which is not found in physical Nature, he is at perfect liberty to use it, since truth to his vision, the unity of the thing he is seeing and expressing is his only business. The line, colour and the rest are not his first, but his

last preoccupation, because they have to carry on them a world of things which have already taken spiritual form in his mind. He has not for instance to re-create for us the human face and body of the Buddha or some one passion or incident of his life, but to reveal the calm of Nirvana through a figure of the Buddha, and every detail and accessory must be turned into a means or an aid of his purpose. And even when it is some human passion or incident he has to portray, it is not usually that alone, but also or more something else in the soul to which it points or from which it starts or some power behind the action that has to enter into the spirit of his design and is often really the main thing. And through the eye that looks on his work he has to appeal not merely to an excitement of the outward soul, but to the inner self, *antarātman*. One may well say that beyond the ordinary cultivation of the aesthetic instinct necessary to all artistic appreciation there is a spiritual insight or culture needed if we are to enter into the whole meaning of Indian artistic creation, otherwise we get only at the surface external things or at the most at things only just below the surface. It is an intuitive and spiritual art and must be seen with the intuitive and spiritual eye.

This is the distinctive character of Indian art and to ignore it is to fall into total incomprehension or into much misunderstanding. Indian architecture, painting, sculpture are not only intimately one in inspiration with the central things in Indian philosophy, religion, Yoga, culture, but a specially intense expression of their significance. There is much in the literature which can be well enough appreciated without any very deep entry into these things, but it is comparatively a very small part of what is left of the other arts, Hindu or Buddhistic, of which this can be said. They have been very largely a hieratic aesthetic script of India's spiritual, contemplative and religious experience.

XIII

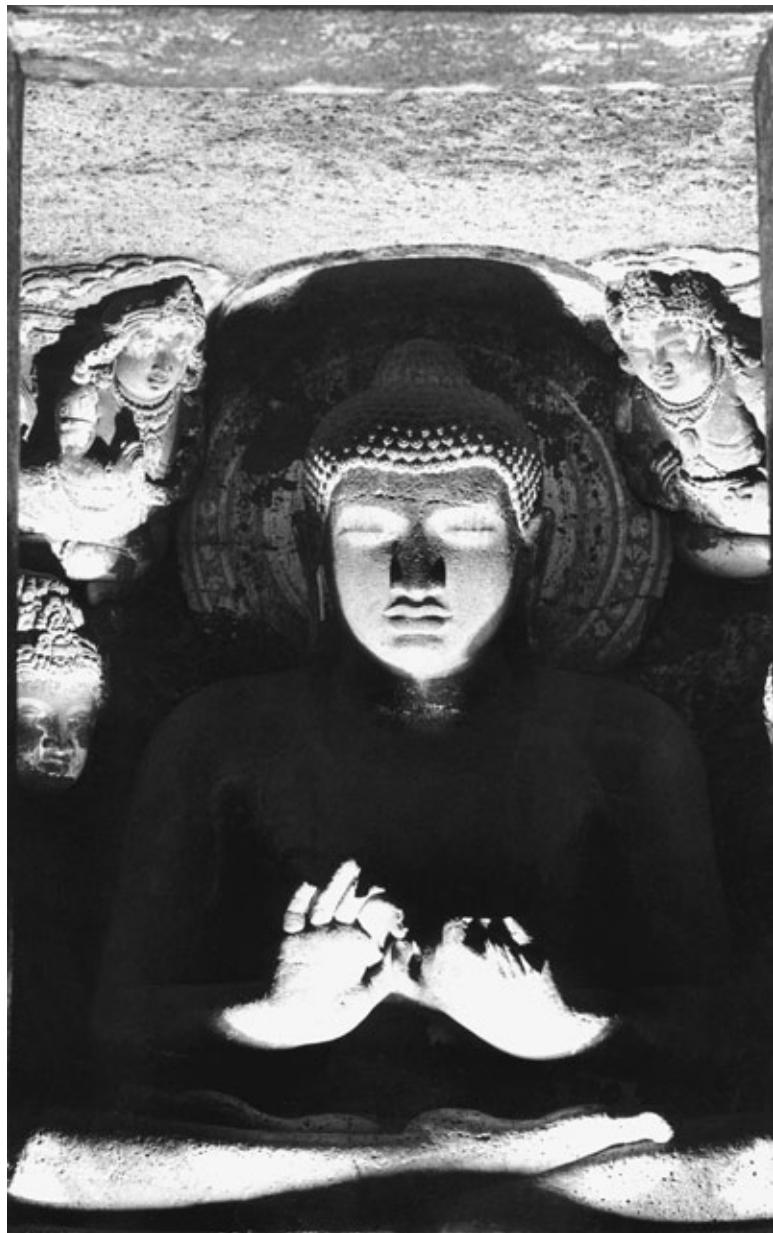

Indian Art-2

ARCHITECTURE, sculpture and painting, because they are the three great arts which appeal to the spirit through the eye, are those too in which the sensible and the invisible meet with the strongest emphasis on themselves and yet the greatest necessity of each other. The form with its insistent masses, proportions, lines, colours, can here only justify them by their service for the something intangible it has to express; the spirit needs all the possible help of the material body to interpret itself to itself through the eye, yet asks of it that it shall be as transparent a veil as possible of its own greater significance. The art of the East and the art of the West—each in its characteristic or mean, for there are always exceptions,—deal with the problem of these two interlocking powers in a quite different way. The Western mind is arrested and attracted by the form, lingers on it and cannot get away from its charm, loves it for its own beauty, rests on the emotional, intellectual, aesthetic suggestions that arise directly from its most visible language, confines the soul in the body; it might almost be said that for this mind form creates the spirit, the spirit depends for its existence and for everything it has to say on the form. The Indian attitude to the matter is at the opposite pole to this view. For the Indian mind form does not exist except as a creation of the spirit and draws all its meaning and value from the spirit. Every line, arrangement of mass, colour, shape, posture, every physical suggestion, however many, crowded, opulent they may be, is first and last a suggestion, a hint, very often a symbol which is in its main function a support for a spiritual emotion, idea, image that again goes beyond itself to the less definable, but more powerfully sensible reality of the spirit which has excited these movements in the aesthetic mind and passed through them into significant shapes.

This characteristic attitude of the Indian reflective and creative mind necessitates in our view of its creations an effort to get beyond at once to the inner spirit of the reality it expresses and see from it and not from outside. And in fact to start from the physical details and their synthesis appears to me quite the wrong way to look at an Indian work of art. The orthodox style of Western criticism seems to be to dwell scrutinisingly on the technique, on form, on the obvious story of the form, and then pass to some appreciation of beautiful or impressive emotion and idea. It is only in some deeper and more sensitive minds that we get beyond that depth into profounder things. A criticism of that kind applied to Indian art leaves it barren or poor of significance. Here the only right way is to get at once through a total intuitive or revelatory impression or by some meditative dwelling on the whole, *dhyāna* in the technical Indian term, to the spiritual meaning and atmosphere, make ourselves one with that as completely as possible, and then only the helpful meaning and value of all the rest comes out with a complete and revealing force. For here it is the spirit that carries the form, while in most Western art it is the form that carries whatever there may be of spirit. The striking phrase of Epictetus recurs to the mind in which he describes man as a little soul carrying a corpse, *psucharion ei bastazon nekron*. The more ordinary Western outlook is upon animate matter carrying in its life a modicum of soul. But the seeing of the Indian mind and of Indian art is that of a great, a limitless self and spirit, *mahān ātmā*, which carries to us in the sea of its presence a living shape of itself, small in comparison to its own infinity, but yet sufficient by the power that informs this symbol to support some aspect of that infinite's self-expression. It is therefore essential that we should look here not solely with the physical eye informed by the reason and the aesthetic imagination, but make the physical seeing a passage to the opening of the inner spiritual eye and a moved communion in the soul. A great oriental work of art does not easily reveal its secret to one who comes to it solely in a mood of aesthetic curiosity or with a considering critical objective mind, still less as the cultivated and interested tourist.

passing among strange and foreign things; but it has to be seen in loneliness, in the solitude of one's self, in moments when one is capable of long and deep meditation and as little weighted as possible with the conventions of material life. That is why the Japanese with their fine sense in these things,—a sense which modern Europe with her assault of crowded art galleries and over-pictured walls seems to have quite lost, though perhaps I am wrong, and those are the right conditions for display of European art,—have put their temples and their Buddhas as often as possible away on mountains and in distant or secluded scenes of Nature and avoid living with great paintings in the crude hours of daily life, but keep them by preference in such a way that their undisputed suggestion can sink into the mind in its finer moments or apart where they can go and look at them in a treasured secrecy when the soul is at leisure from life. That is an indication of the utmost value pointing to the nature of the appeal made by Eastern art and the right way and mood for looking at its creations.

Indian architecture especially demands this kind of inner study and this spiritual self-identification with its deepest meaning and will not otherwise reveal itself to us. The secular buildings of ancient India, her palaces and places of assembly and civic edifices have not outlived the ravage of time; what remains to us is mostly something of the great mountain and cave temples, something too of the temples of her ancient cities of the plains, and for the rest we have the fanes and shrines of her later times, whether situated in temple cities and places of pilgrimage like Srirangam and Rameshwaram or in her great once regal towns like Madura, when the temple was the centre of life. It is then the most hieratic side of a hieratic art that remains to us. These sacred buildings are the signs, the architectural self-expression of an ancient spiritual and religious culture. Ignore the spiritual suggestion, the religious significance, the meaning of the symbols and indications, look only with the rational and secular aesthetic mind, and it is vain to expect that we shall get to any true and discerning appreciation of this art. And it has to be remembered too that the religious spirit here is something

9. Dhyani Buddha, Ajanta

The figure of the Buddha achieves the expression of the infinite in a finite image,... the illimitable calm of Nirvana in a human form and visage. (p. 291)

10. Maheshwara Murti, Elephanta Caves

The inspiration, the way of seeing is frankly not naturalistic, not, that is to say, the vivid, convincing and accurate, the graceful, beautiful or strong, or even the idealised or imaginative imitation of surface or terrestrial nature. (p. 293)

11. Durga Mahishasuramardini, Mamallapuram

The gods of Indian sculpture are cosmic beings, embodiments of some great spiritual power, spiritual idea and action, inmost psychic significance, the human form a vehicle of this soul meaning, its outward means of self-expression; everything in the figure, every opportunity it gives, the face, the hands, the posture of the limbs, the poise and turn of the body, every accessory, has to be made instinct with the inner meaning, help it to emerge, carry out the rhythm of the total suggestion.... (p. 290)

12. Nagaraja and Queen, Ajanta

The sculptor must express always in static form; the idea of the spirit is cut out for him in mass and line, significant in the stability of its insistence...;

13. Buddha, Mathura Museum

for him eternity seizes hold of time in its shapes and arrests it in the monumental spirit of stone or bronze. (p. 302)

14. Princely Doorkeeper, Mamallapuram

The material in which we work makes its own peculiar demand on the creative spirit, lays down its own natural conditions, ...

15. Vrikshaka, Gwalior Museum

and the art of making in stone or bronze calls for a cast of mind which the ancients had and the moderns have not or have had only in rare individuals.... (p. 287)

16. Buddha, Sarnath

An assured history of two millenniums of accomplished sculptural creation is a rare and significant fact in the life of a people. (p. 288)

quite different from the sense of European religions; and even mediaeval Christianity, especially as now looked at by the modern European mind which has gone through the two great crises of the Renaissance and recent secularism, will not in spite of its oriental origin and affinities be of much real help. To bring in into the artistic look on an Indian temple occidental memories or a comparison with Greek Parthenon or Italian church or Duomo or Campanile or even the great Gothic cathedrals of mediaeval France, though these have in them something much nearer to the Indian mentality, is to intrude a fatally foreign and disturbing element or standard in the mind. But this consciously or else subconsciously is what almost every European mind does to a greater or less degree,—and it is here a pernicious immixture, for it subjects the work of a vision that saw the immeasurable to the tests of an eye that dwells only on measure.

Indian sacred architecture of whatever date, style or dedication goes back to something timelessly ancient and now outside India almost wholly lost, something which belongs to the past, and yet it goes forward too, though this the rationalistic mind will not easily admit, to something which will return upon us and is already beginning to return, something which belongs to the future. An Indian temple, to whatever godhead it may be built, is in its inmost reality an altar raised to the divine Self, a house of the Cosmic Spirit, an appeal and aspiration to the Infinite. As that and in the light of that seeing and conception it must in the first place be understood, and everything else must be seen in that setting and that light, and then only can there be any real understanding. No artistic eye however alert and sensible and no aesthetic mind however full and sensitive can arrive at that understanding, if it is attached to a Hellenised conception of rational beauty or shuts itself up in a materialised or intellectual interpretation and fails to open itself to the great things here meant by a kindred close response to some touch of the cosmic consciousness, some revelation of the greater spiritual self, some suggestion of the Infinite. These things, the spiritual self, the cosmic spirit, the Infinite, are not rational, but suprarational, eternal presences, but to the intellect only words, and visible, sensible,

near only to an intuition and revelation in our inmost selves. An art which starts from them as a first conception can only give us what it has to give, their touch, their nearness, their self-disclosure, through some responding intuition and revelation in us, in our own soul, our own self. It is this which one must come to it to find and not demand from it the satisfaction of some quite other seeking or some very different turn of imagination and more limited superficial significance.

This is the first truth of Indian architecture and its significance which demands emphasis and it leads at once to the answer to certain very common misapprehensions and objections. All art reposes on some unity and all its details, whether few and sparing or lavish and crowded and full, must go back to that unity and help its significance; otherwise it is not art. Now we find our Western critic telling us with an assurance which would be stupefying if one did not see how naturally it arose, that in Indian architecture there is no unity, which is as much as to say that there is here no great art at all, but only a skill in the execution of crowded and unrelated details. We are told even by otherwise sympathetic judges that there is an overloading of ornament and detail which, however beautiful or splendid in itself, stands in the way of unity, an attempt to load every rift with ore, an absence of calm, no unfilled spaces, no relief to the eye. Mr. Archer as usual carries up the adverse criticism to its extreme clamorous top notes; his heavily shotted phrases are all a continuous insistence on this one theme. The great temples of the South of India are, he allows, marvels of massive construction. He seems by the way to have a rooted objection to massiveness in architecture or great massed effects in sculpture, regardless of their appropriateness or need, although he admits them in literature. Still this much there is and with it a sort of titanic impressiveness, but of unity, clarity, nobility there is no trace. This observation seems to my judgment sufficiently contradictory, since I do not understand how there can be a marvel of construction, whether light or massive, without any unity,—but here is not even, it seems, a trace of it—or a mighty impressiveness without any greatness or nobility whatever, even allowing this to be a Titanic and not

an Olympian nobleness. He tells us that everything is ponderous, everything here overwrought and the most prominent features swarming, writhing with contorted semi-human figures are as senseless as anything in architecture. How, one might ask, does he know that they are senseless, when he practically admits that he has made no attempt to find what is their sense, but has simply assumed from the self-satisfied sufficiency of his own admitted ignorance and failure to understand that there cannot be any meaning? And the whole thing he characterises as a monstrosity built by Rakshasas, ogres, demons, a gigantesque barbarism. The northern buildings find a little less disfavour in his eyes, but the difference in the end is small or none. There is the same ponderousness, absence of lightness and grace, an even greater profusion of incised ornament; these too are barbaric creations. Alone the Mahomedan architecture, called Indo-Saracenic, is exempted from this otherwise universal condemnation.

It is a little surprising after all, however natural the first blindness here, that even assailants of this extreme kind, since they must certainly know that there can be no art, no effective construction without unity, should not have paused even once to ask themselves whether after all there must not be here some principle of oneness which they had missed because they came with alien conceptions and looked at things from the wrong end, and before pronouncing this magisterial judgment should not have had patience to wait in a more detached and receptive way upon the thing under their eye and seen whether then some secret of unity did not emerge. But it is the more sympathetic and less violent critic who deserves a direct answer. Now it may readily be admitted that the failure to see at once the unity of this architecture is perfectly natural to a European eye, because unity in the sense demanded by the Western conception, the Greek unity gained by much suppression and a sparing use of detail and circumstance or even the Gothic unity got by casting everything into the mould of a single spiritual aspiration, is not there. And the greater unity that really is there can never be arrived at at all, if the eye begins and ends by dwelling on form and detail and ornament, because it will then be obsessed by

these things and find it difficult to go beyond to the unity which all this in its totality serves not so much to express in itself, but to fill it with that which comes out of it and relieve its oneness by multitude. An original oneness, not a combined or synthetic or an effected unity, is that from which this art begins and to which its work when finished returns or rather lives in it as in its self and natural atmosphere. Indian sacred architecture constantly represents the greatest oneness of the self, the cosmic, the infinite in the immensity of its world-design, the multitude of its features of self-expression, *lakṣana*, (yet the oneness is greater than and independent of their totality and in itself indefinable), and all its starting-point of unity in conception, its mass of design and immensity of material, its crowding abundance of significant ornament and detail and its return towards oneness are only intelligible as necessary circumstances of this poem, this epic or this lyric — for there are smaller structures which are such lyrics — of the Infinite. The Western mentality, except in those who are coming or returning, since Europe had once something of this cult in her own way, to this vision, may find it difficult to appreciate the truth and meaning of such an art, which tries to figure existence as a whole and not in its pieces; but I would invite those Indian minds who are troubled by these criticisms or partly or temporarily overpowered by the Western way of seeing things, to look at our architecture in the light of this conception and see whether all but minor objections do not vanish as soon as the real meaning makes itself felt and gives body to the first indefinable impression and emotion which we experience before the greater constructions of the Indian builders.

To appreciate this spiritual-aesthetic truth of Indian architecture, it will be best to look first at some work where there is not the complication of surroundings now often out of harmony with the building, outside even those temple towns which still retain their dependence on the sacred motive, and rather in some place where there is room for a free background of Nature. I have before me two prints which can well serve the purpose, a temple at Kalahasti, a temple at Sinhachalam, two buildings entirely different in treatment and yet one in the ground and

the universal motive. The straight way here is not to detach the temple from its surroundings, but to see it in unity with the sky and low-lying landscape or with the sky and hills around and feel the thing common to both, the construction and its environment, the reality in Nature, the reality expressed in the work of art. The oneness to which this Nature aspires in her inconscient self-creation and in which she lives, the oneness to which the soul of man uplifts itself in his conscious spiritual upbuilding, his labour of aspiration here expressed in stone, and in which so upbuilt he and his work live, are the same and the soul-motive is one. Thus seen this work of man seems to be something which has started out and detached itself against the power of the natural world, something of the one common aspiration in both to the same infinite spirit of itself,—the inconscient uplook and against it the strong single relief of the self-conscious effort and success of finding. One of these buildings climbs up bold, massive in projection, up-piled in the greatness of a forceful but sure ascent, preserving its range and line to the last, the other soars from the strength of its base, in the grace and emotion of a curving mass to a rounded summit and crowning symbol. There is in both a constant, subtle yet pronounced lessening from the base towards the top, but at each stage a repetition of the same form, the same multiplicity of insistence, the same crowded fullness and indented relief, but one maintains its multiple endeavour and indication to the last, the other ends in a single sign. To find the significance we have first to feel the oneness of the infinity in which this nature and this art live, then see this thronged expression as the sign of the infinite multiplicity which fills this oneness, see in the regular lessening ascent of the edifice the subtler and subtler return from the base on earth to the original unity and seize on the symbolic indication of its close at the top. Not absence of unity, but a tremendous unity is revealed. Reinterpret intimately what this representation means in the terms of our own spiritual self-existence and cosmic being, and we have what these great builders saw in themselves and reared in stone. All objections, once we have got at this identity in spiritual experience, fall away and show themselves to be what

they really are, the utterance and cavil of an impotent misunderstanding, an insufficient apprehension or a complete failure to see. To appreciate the detail of Indian architecture is easy when the whole is thus seen and known; otherwise, it is impossible.

This method of interpretation applies, however different the construction and the nature of the rendering, to all Dravidian architecture, not only to the mighty temples of far-spread fame, but to unknown roadside shrines in small towns, which are only a slighter execution of the same theme, a satisfied suggestion here, but the greater buildings a grandiose fulfilled aspiration. The architectural language of the north is of a different kind, there is another basic style; but here too the same spiritual, meditative, intuitive method has to be used and we get at the same result, an aesthetic interpretation or suggestion of the one spiritual experience, one in all its complexity and diversity, which founds the unity of the infinite variations of Indian spirituality and religious feeling and the realised union of the human self with the Divine. This is the unity too of all the creations of this hieratic art. The different styles and motives arrive at or express that unity in different ways. The objection that an excess of thronging detail and ornament hides, impairs or breaks up the unity, is advanced only because the eye has made the mistake of dwelling on the detail first without relation to this original spiritual oneness, which has first to be fixed in an intimate spiritual seeing and union and then all else seen in that vision and experience. When we look on the multiplicity of the world, it is only a crowded plurality that we can find and to arrive at unity we have to reduce, to suppress what we have seen or sparingly select a few indications or to be satisfied with the unity of this or that separate idea, experience or imagination; but when we have realised the self, the infinite unity and look back on the multiplicity of the world, then we find that oneness able to bear all the infinity of variation and circumstance we can crowd into it and its unity remains unabridged by even the most endless self-multiplication of its informing creation. We find the same thing in looking at this architecture. The wealth of ornament, detail, circumstance in Indian temples represents the infinite variety and

repetition of the worlds,—not our world only, but all the planes,—suggests the infinite multiplicity in the infinite oneness. It is a matter of our own experience and fullness of vision how much we leave out or bring in, whether we express so much or so little or attempt as in the Dravidian style to give the impression of a teeming inexhaustible plenitude. The largeness of this unity is base and continent enough for any superstructure or content of multitude.

To condemn this abundance as barbarous is to apply a foreign standard. Where after all are we bound to draw the line? To the pure classical taste Shakespeare's art once appeared great but barbarous for a similar reason,—one remembers the Gallic description of him as a drunken barbarian of genius,—his artistic unity non-existent or spoilt by crowding tropical vegetation of incident and character, his teeming imaginations violent, exaggerated, sometimes bizarre, monstrous, without symmetry, proportion and all the other lucid unities, lightnesses, graces loved by the classic mind. That mind might say of his work in language like Mr. Archer's that here there is indeed a Titanic genius, a mass of power, but of unity, clarity, classic nobility no trace, but rather an entire absence of lucid grace and lightness and restraint, a profusion of wild ornament and an imaginative riot without law or measure, strained figures, distorted positions and gestures, no dignity, no fine, just, rationally natural and beautiful classic movement and pose. But even the strictest Latin mind has now got over its objections to the "splendid barbarism" of Shakespeare and can understand that here is a fuller, less sparing and exiguous vision of life, a greater intuitive unity than the formal unities of the classic aesthetics. But the Indian vision of the world and existence was vaster and fuller than Shakespeare's, because it embraced not merely life, but all being, not merely humanity, but all the worlds and all Nature and cosmos. The European mind not having arrived except in individuals at any close, direct, insistent realisation of the unity of the infinite self or the cosmic consciousness peopled with its infinite multiplicity, is not driven to express these things, cannot understand or put up with them when they are expressed in this

oriental art, speech and style and object to it as the Latin mind once objected to Shakespeare. Perhaps the day is not distant when it will see and understand and perhaps even itself try to express the same things in another language.

The objection that the crowding detail allows no calm, gives no relief or space to the eye, falls under the same heading, springs from the same root, is urged from a different experience and has no validity for the Indian experience. For this unity on which all is upborne, carries in itself the infinite space and calm of the spiritual realisation, and there is no need for other unfilled spaces or tracts of calm of a lesser more superficial kind. The eye is here only a way of access to the soul, it is to that that there is the appeal, and if the soul living in this realisation or dwelling under the influence of this aesthetic impression needs any relief, it is not from the incidence of life and form, but from the immense incidence of that vastness of infinity and tranquil silence, and that can only be given by its opposite, by an abundance of form and detail and life. As for the objection in regard to Dravidian architecture to its massiveness and its Titanic construction, the precise spiritual effect intended could not be given otherwise; for the infinite, the cosmic seen as a whole in its vast manifestation is Titanic, is mighty in material and power. It is other and quite different things also, but none of these are absent from Indian construction. The great temples of the north have often in spite of Mr. Archer's dictum, a singular grace in their power, a luminous lightness relieving their mass and strength, a rich delicacy of beauty in their ornate fullness. It is not indeed the Greek lightness, clarity or naked nobleness, nor is it exclusive, but comes in in a fine blending of opposites which is in the very spirit of the Indian religious, philosophical and aesthetic mind. Nor are these things absent from many Dravidian buildings, though in certain styles they are boldly sacrificed or only put into minor incidents,— one instance of the kind Mr. Archer rejoices in as an oasis in the desert of this to him unintelligible mass of might and greatness,— but in either case suppressed so that the fullness of solemn and grandiose effect may have a complete, an undiminished expression.

I need not deal with adverse strictures of a more insignificant kind,—such as the dislike of the Indian form of the arch and dome, because they are not the radiating arch and dome of other styles. That is only an intolerant refusal to admit the beauty of unaccustomed forms. It is legitimate to prefer one's own things, those to which our mind and nature have been trained, but to condemn other art and effort because it also prefers its own way of arriving at beauty, greatness, self-expression, is a narrowness which with the growth of a more catholic culture ought to disappear. But there is one comment on Dravidian temple architecture which is worth noting because it is made by others than Mr. Archer and his kind. Even a sympathetic mind like Professor Geddes is impressed by some sense of a monstrous effect of terror and gloom in these mighty buildings. Such expressions are astonishing to an Indian mind because terror and gloom are conspicuously absent from the feelings aroused in it by its religion, art or literature. In the religion they are rarely awakened and only in order to be immediately healed and, even when they come, are always sustained by the sense of a supporting and helping presence, an eternal greatness and calm or love or Delight behind; the very goddess of destruction is at the same time the compassionate and loving Mother; the austere Maheshwara, Rudra, is also Shiva, the auspicious, Ashutosha, the refuge of men. The Indian thinking and religious mind looks with calm, without shrinking or repulsion, with an understanding born of its agelong effort at identity and oneness, at all that meets it in the stupendous spectacle of the cosmos. And even its asceticism, its turning from the world, which begins not in terror and gloom, but in a sense of vanity and fatigue, or of something higher, truer, happier than life, soon passes beyond any element of pessimistic sadness into the rapture of the eternal peace and bliss. Indian secular poetry and drama is throughout rich, vital and joyous and there is more tragedy, terror, sorrow and gloom packed into any few pages of European work than we can find in the whole mass of Indian literature. It does not seem to me that Indian art is at all different in this respect from the religion and literature. The Western mind is here thrusting in its own habitual reactions

upon things in the indigenous conception in which they have no proper place. Mark the curious misreading of the dance of Shiva as a dance of Death or Destruction, whereas, as anybody ought to be able to see who looks upon the Nataraja, it expresses on the contrary the rapture of the cosmic dance with the profundities behind of the unmoved eternal and infinite bliss. So too the figure of Kali which is so terrible to European eyes is, as we know, the Mother of the universe accepting this fierce aspect of destruction in order to slay the Asuras, the powers of evil in man and the world. There are other strands in this feeling in the Western mind which seem to spring from a dislike of anything uplifted far beyond the human measure and others again in which we see a subtle survival of the Greek limitation, the fear, gloom and aversion with which the sunny terrestrial Hellenic mind commonly met the idea of the beyond, the limitless, the unknown; but that reaction has no place in Indian mentality. And as for the strangeness or formidable aspect of certain unhuman figures or the conception of demons or Rakshasas, it must be remembered that the Indian aesthetic mind deals not only with the earth but with psychic planes in which these things exist and ranges freely among them without being overpowered because it carries everywhere the stamp of a large confidence in the strength and the omnipresence of the Self or the Divine.

I have dwelt on Hindu and especially on Dravidian architecture because the latter is the most fiercely attacked as the most uncompromisingly foreign to European taste. But a word too may be said about Indo-Moslem architecture. I am not concerned to defend any claim for the purely indigenous origin of its features. It seems to me that here the Indian mind has taken in much from the Arab and Persian imagination and in certain mosques and tombs I seem to find an impress of the robust and bold Afghan and Mogul temperament; but it remains clear enough that it is still on the whole a typically Indian creation with the peculiar Indian gift. The richness of decorative skill and imagination has been turned to the uses of another style, but it is the same skill which we find in the northern Hindu temples, and in the ground we see, however toned down, something some-

times of the old epic mass and power, but more often that lyric grace which we see developing before the Mahomedan advent in the indigenous sculpture,—as in the schools of the North-East and of Java,—and sometimes a blending of the two motives. The modification, the toning down sets the average European mind at ease and secures its suffrage. But what is it that it so much admires? Mr. Archer tells us at first that it is its rational beauty, refinement and grace, normal, fair, refreshing after the monstrous riot of Hindu Yogic hallucination and nightmare. That description which might have been written of Greek art, seems to me grotesquely inapplicable. Immediately afterwards he harps on quite another and an incompatible phrase, and calls it a fairy-land of exquisite architecture. A rational fairy-land is a wonder which may perhaps be hereafter discovered by some strange intertwining of the nineteenth and twentieth century minds, but I do not think it has yet existed on earth or in the heavens. Not rational but magical beauty satisfying and enchanting to some deeper quite suprarational aesthetic soul in us is the inexpressible charm of these creations. But still where does the magic touch our critic? He tells us in a rapt journalistic style. It is the exquisite marble tracerries, the beautiful domes and minarets, the stately halls of sepulture, the marvellous loggias and arcades, the magnificent plinths and platforms, the majestic gateways, et cetera. And is this then all? Only the charm of an outward material luxury and magnificence? Yes; Mr. Archer again tells us that we must be content here with a visual sensuous beauty without any moral suggestion. And that helps him to bring in the sentence of destructive condemnation without which he could not feel happy in dealing with Indian things: this Moslem architecture suggests not only unbridled luxury, but effeminacy and decadence! But in that case, whatever its beauty, it belongs entirely to a secondary plane of artistic creation and cannot rank with the great spiritual aspirations in stone of the Hindu builders.

I do not demand “moral suggestions” from architecture, but is it true that there is nothing but a sensuous outward grace and beauty and luxury in these Indo-Moslem buildings? It is not at

all true of the characteristic greater work. The Taj is not merely a sensuous reminiscence of an imperial amour or a fairy enchantment hewn from the moon's lucent quarries, but the eternal dream of a love that survives death. The great mosques embody often a religious aspiration lifted to a noble austerity which supports and is not lessened by the subordinated ornament and grace. The tombs reach beyond death to the beauty and joy of Paradise. The buildings of Fatehpur-Sikri are not monuments of an effeminate luxurious decadence,—an absurd description for the mind of the time of Akbar,—but give form to a nobility, power and beauty which lay hold upon but do not wallow on the earth. There is not here indeed the vast spiritual content of the earlier Indian mind, but it is still an Indian mind which in these delicate creations absorbs the West Asian influence, and lays stress on the sensuous as before in the poetry of Kalidasa, but uplifts it to a certain immaterial charm, rises often from the earth without quite leaving it into the magical beauty of the middle world and in the religious mood touches with a devout hand the skirts of the Divine. The all-pervading spiritual obsession is not there, but other elements of life not ignored by Indian culture and gaining on it since the classical times are here brought out under a new influence and are still penetrated with some radiant glow of a superior lustre.

Indian Art - 3

THE SCULPTURE and painting of ancient India have recently been rehabilitated with a surprising suddenness in the eyes of a more cultivated European criticism in the course of that rapid opening of the Western mind to the value of oriental thought and creation which is one of the most significant signs of a change that is yet only in its beginning. There have even been here and there minds of a fine perception and profound originality who have seen in a return to the ancient and persistent freedom of oriental art, its refusal to be shackled or debased by an imitative realism, its fidelity to the true theory of art as an inspired interpretation of the deeper soul values of existence lifted beyond servitude to the outsides of Nature, the right way to the regeneration and liberation of the aesthetic and creative mind of Europe. And actually, although much of Western art runs still along the old grooves, much too of its most original recent creation has elements or a guiding direction which brings it nearer to the Eastern mentality and understanding. It might then be possible for us to leave it at that and wait for time to deepen this new vision and vindicate more fully the truth and greatness of the art of India.

But we are concerned not only with the critical estimation of our art by Europe, but much more nearly with the evil effect of the earlier depreciation on the Indian mind which has been for a long time side-tracked off its true road by a foreign, an anglicised education and, as a result, vulgarised and falsified by the loss of its own true centre, because this hampers and retards a sound and living revival of artistic taste and culture and stands in the way of a new age of creation. It was only a few years ago that the mind of educated India — “educated” without an atom of real culture — accepted contentedly the vulgar English estimate of our sculpture and painting as undeveloped inferior art or even

a mass of monstrous and abortive miscreation, and though that has passed and there is a great change, there is still very common a heavy weight of secondhand occidental notions, a bluntness or absolute lacking of aesthetic taste,¹ a failure to appreciate, and one still comes sometimes across a strain of blatantly anglicised criticism which depreciates all that is in the Indian manner and praises only what is consistent with Western canons. And the old style of European criticism continues to have some weight with us, because the lack of aesthetic or indeed of any real cultural training in our present system of education makes us ignorant and undiscriminating receptacles, so that we are ready to take the considered opinions of competent critics like Okakura or Mr. Laurence Binyon and the rash scribblings of journalists of the type of Mr. Archer, who write without authority because in these things they have neither taste nor knowledge, as of equal importance and the latter even attract a greater attention. It is still necessary therefore to reiterate things which, however obvious to a trained or sensitive aesthetic intelligence, are not yet familiar to the average mind still untutored or habituated to a system of false weights and values. The work of recovering a true and inward understanding of ourselves—our past and our present self and from that our future—is only in its commencement for the majority of our people.

To appreciate our own artistic past at its right value we have to free ourselves from all subjection to a foreign outlook and see our sculpture and painting, as I have already suggested about our architecture, in the light of its own profound intention and greatness of spirit. When we so look at it, we shall be able to see that the sculpture of ancient and mediaeval India claims its place on the very highest levels of artistic achievement. I do not know where we shall find a sculptural art of a more profound intention, a greater spirit, a more consistent skill of achievement. Inferior work there is, work that fails or succeeds

¹ For example, one still reads with a sense of despairing stupefaction “criticism” that speaks of Ravi Varma and Abanindranath Tagore as artistic creators of different styles, but an equal power and genius!

only partially, but take it in its whole, in the long persistence of its excellence, in the number of its masterpieces, in the power with which it renders the soul and the mind of a people, and we shall be tempted to go further and claim for it a first place. The art of sculpture has indeed flourished supremely only in ancient countries where it was conceived against its natural background and support, a great architecture. Egypt, Greece, India take the premier rank in this kind of creation. Mediaeval and modern Europe produced nothing of the same mastery, abundance and amplitude, while on the contrary in painting later Europe has done much and richly and with a prolonged and constantly renewed inspiration. The difference arises from the different kind of mentality required by the two arts. The material in which we work makes its own peculiar demand on the creative spirit, lays down its own natural conditions, as Ruskin has pointed out in a different connection, and the art of making in stone or bronze calls for a cast of mind which the ancients had and the moderns have not or have had only in rare individuals, an artistic mind not too rapidly mobile and self-indulgent, not too much mastered by its own personality and emotion and the touches that excite and pass, but founded rather on some great basis of assured thought and vision, stable in temperament, fixed in its imagination on things that are firm and enduring. One cannot trifle with ease in these sterner materials, one cannot even for long or with safety indulge in them in mere grace and external beauty or the more superficial, mobile and lightly attractive motives. The aesthetic self-indulgence which the soul of colour permits and even invites, the attraction of the mobile play of life to which line of brush, pen or pencil gives latitude, are here forbidden or, if to some extent achieved, only within a line of restraint to cross which is perilous and soon fatal. Here grand or profound motives are called for, a more or less penetrating spiritual vision or some sense of things eternal to base the creation. The sculptural art is static, self-contained, necessarily firm, noble or severe and demands an aesthetic spirit capable of these qualities. A certain mobility of life and mastering grace of line can come in upon this basis, but if it entirely replaces the original dharma of the

material, that means that the spirit of the statuette has come into the statue and we may be sure of an approaching decadence. Hellenic sculpture following this line passed from the greatness of Phidias through the soft self-indulgence of Praxiteles to its decline. A later Europe has failed for the most part in sculpture, in spite of some great work by individuals, an Angelo or a Rodin, because it played externally with stone and bronze, took them as a medium for the representation of life and could not find a sufficient basis of profound vision or spiritual motive. In Egypt and in India, on the contrary, sculpture preserved its power of successful creation through several great ages. The earliest recently discovered work in India dates back to the fifth century B.C. and is already fully evolved with an evident history of consummate previous creation behind it, and the latest work of some high value comes down to within a few centuries from our own time. An assured history of two millenniums of accomplished sculptural creation is a rare and significant fact in the life of a people.

This greatness and continuity of Indian sculpture is due to the close connection between the religious and philosophical and the aesthetic mind of the people. Its survival into times not far from us was possible because of the survival of the cast of the antique mind in that philosophy and religion, a mind familiar with eternal things, capable of cosmic vision, having its roots of thought and seeing in the profundities of the soul, in the most intimate, pregnant and abiding experiences of the human spirit. The spirit of this greatness is indeed at the opposite pole to the perfection within limits, the lucid nobility or the vital fineness and physical grace of Hellenic creation in stone. And since the favourite trick of Mr. Archer and his kind is to throw the Hellenic ideal constantly in our face, as if sculpture must be either governed by the Greek standard or worthless, it is as well to take note of the meaning of the difference. The earlier and more archaic Greek style had indeed something in it which looks like a reminiscent touch of a first creative origin from Egypt and the Orient, but there is already there the governing conception which determined the Greek aesthetics and has dominated the

Painting is naturally the most sensuous of the arts, and the highest greatness open to the painter is to spiritualise this sensuous appeal by making the most vivid outward beauty a revelation of subtle spiritual emotion.... (p. 302)

later mind of Europe, the will to combine some kind of expression of an inner truth with an idealising imitation of external Nature. The brilliance, beauty and nobility of the work which was accomplished, was a very great and perfect thing, but it is idle to maintain that that is the sole possible method or the one permanent and natural law of artistic creation. Its highest greatness subsisted only so long — and it was not for very long — as a certain satisfying balance was struck and constantly maintained between a fine, but not very subtle, opulent or profound spiritual suggestion and an outward physical harmony of nobility and grace. A later work achieved a brief miracle of vital suggestion and sensuous physical grace with a certain power of expressing the spirit of beauty in the mould of the senses; but this once done, there was no more to see or create. For the curious turn which impels at the present day the modern mind to return to spiritual vision through a fiction of exaggerated realism which is really a pressure upon the form of things to yield the secret of the spirit in life and matter, was not open to the classic temperament and intelligence. And it is surely time for us to see, as is now by many admitted, that an acknowledgment of the greatness of Greek art in its own province ought not to prevent the plain perception of the rather strait and narrow bounds of that province. What Greek sculpture expressed was fine, gracious and noble, but what it did not express and could not by the limitations of its canon hope to attempt, was considerable, was immense in possibility, was that spiritual depth and extension which the human mind needs for its larger and deeper self-experience. And just this is the greatness of Indian sculpture that it expresses in stone and bronze what the Greek aesthetic mind could not conceive or express and embodies it with a profound understanding of its right conditions and a native perfection.

The more ancient sculptural art of India embodies in visible form what the Upanishads threw out into inspired thought and the Mahabharata and Ramayana portrayed by the word in life. This sculpture like the architecture springs from spiritual realisation, and what it creates and expresses at its greatest is the spirit in form, the soul in body, this or that living soul power

in the divine or the human, the universal and cosmic individualised in suggestion but not lost in individuality, the impersonal supporting a not too insistent play of personality, the abiding moments of the eternal, the presence, the idea, the power, the calm or potent delight of the spirit in its actions and creations. And over all the art something of this intention broods and persists and is suggested even where it does not dominate the mind of the sculptor. And therefore as in the architecture so in the sculpture, we have to bring a different mind to this work, a different capacity of vision and response, we have to go deeper into ourselves to see than in the more outwardly imaginative art of Europe. The Olympian gods of Phidias are magnified and uplifted human beings saved from a too human limitation by a certain divine calm of impersonality or universalised quality, divine type, guna; in other work we see heroes, athletes, feminine incarnations of beauty, calm and restrained embodiments of idea, action or emotion in the idealised beauty of the human figure. The gods of Indian sculpture are cosmic beings, embodiments of some great spiritual power, spiritual idea and action, inmost psychic significance, the human form a vehicle of this soul meaning, its outward means of self-expression; everything in the figure, every opportunity it gives, the face, the hands, the posture of the limbs, the poise and turn of the body, every accessory, has to be made instinct with the inner meaning, help it to emerge, carry out the rhythm of the total suggestion, and on the other hand everything is suppressed which would defeat this end, especially all that would mean an insistence on the merely vital or physical, outward or obvious suggestions of the human figure. Not the ideal physical or emotional beauty, but the utmost spiritual beauty or significance of which the human form is capable, is the aim of this kind of creation. The divine self in us is its theme, the body made a form of the soul is its idea and its secret. And therefore in front of this art it is not enough to look at it and respond with the aesthetic eye and the imagination, but we must look also into the form for what it carries and even through and behind it to pursue the profound suggestion it gives into its own infinite. The religious

or hieratic side of Indian sculpture is intimately connected with the spiritual experiences of Indian meditation and adoration,—those deep things of our self-discovery which our critic calls contemptuously Yogic hallucinations,—soul realisation is its method of creation and soul realisation must be the way of our response and understanding. And even with the figures of human beings or groups it is still a like inner aim and vision which governs the labour of the sculptor. The statue of a king or a saint is not meant merely to give the idea of a king or saint or to portray some dramatic action or to be a character portrait in stone, but to embody rather a soul state or experience or deeper soul quality, as for instance, not the outward emotion, but the inner soul-side of rapt ecstasy of adoration and God-vision in the saint or the devotee before the presence of the worshipped deity. This is the character of the task the Indian sculptor set before his effort and it is according to his success in that and not by the absence of something else, some quality or some intention foreign to his mind and contrary to his design, that we have to judge of his achievement and his labour.

Once we admit this standard, it is impossible to speak too highly of the profound intelligence of its conditions which was developed in Indian sculpture, of the skill with which its task was treated or of the consummate grandeur and beauty of its masterpieces. Take the great Buddhas — not the Gandharan, but the divine figures or groups in cave cathedral or temple, the best of the later southern bronzes of which there is a remarkable collection of plates in Mr. Gangoly's book on that subject, the Kalasanvara image, the Natarajas. No greater or finer work, whether in conception or execution, has been done by the human hand and its greatness is increased by obeying a spiritualised aesthetic vision. The figure of the Buddha achieves the expression of the infinite in a finite image, and that is surely no mean or barbaric achievement, to embody the illimitable calm of Nirvana in a human form and visage. The Kalasanvara Shiva is supreme not only by the majesty, power, calmly forceful control, dignity and kingship of existence which the whole spirit and pose of the figure visibly incarnates,—that is only half or less than half

its achievement,—but much more by the concentrated divine passion of the spiritual overcoming of time and existence which the artist has succeeded in putting into eye and brow and mouth and every feature and has subtly supported by the contained suggestion, not emotional, but spiritual, of every part of the body of the godhead and the rhythm of his meaning which he has poured through the whole unity of this creation. Or what of the marvellous genius and skill in the treatment of the cosmic movement and delight of the dance of Shiva, the success with which the posture of every limb is made to bring out the rhythm of the significance, the rapturous intensity and abandon of the movement itself and yet the just restraint in the intensity of motion, the subtle variation of each element of the single theme in the seizing idea of these master sculptors? Image after image in the great temples or saved from the wreck of time shows the same grand traditional art and the genius which worked in that tradition and its many styles, the profound and firmly grasped spiritual idea, the consistent expression of it in every curve, line and mass, in hand and limb, in suggestive pose, in expressive rhythm,—it is an art which, understood in its own spirit, need fear no comparison with any other, ancient or modern, Hellenic or Egyptian, of the near or the far East or of the West in any of its creative ages. This sculpture passed through many changes, a more ancient art of extraordinary grandeur and epic power uplifted by the same spirit as reigned in the Vedic and Vedantic seers and in the epic poets, a later Puranic turn towards grace and beauty and rapture and an outburst of lyric ecstasy and movement, and last a rapid and vacant decadence; but throughout all the second period too the depth and greatness of sculptural motive supports and vivifies the work and in the very turn towards decadence something of it often remains to redeem from complete debasement, emptiness or insignificance.

Let us see then what is the value of the objections made to the spirit and style of Indian sculpture. This is the burden of the objurgations of the devil's advocate that his self-bound European mind finds the whole thing barbaric, meaningless, uncouth, strange, bizarre, the work of a distorted imagination

labouring mid a nightmare of unlovely unrealities. Now there is in the total of what survives to us work that is less inspired or even work that is bad, exaggerated, forced or clumsy, the production of mechanic artificers mingled with the creation of great nameless artists, and an eye that does not understand the sense, the first conditions of the work, the mind of the race or its type of aesthesia, may well fail to distinguish between good and inferior execution, decadent work and the work of the great hands and the great eras. But applied as a general description the criticism is itself grotesque and distorted and it means only that here are conceptions and a figuring imagination strange to the Western intelligence. The line and run and turn demanded by the Indian aesthetic sense are not the same as those demanded by the European. It would take too long to examine the detail of the difference which we find not only in sculpture, but in the other plastic arts and in music and even to a certain extent in literature, but on the whole we may say that the Indian mind moves on the spur of a spiritual sensitiveness and psychic curiosity, while the aesthetic curiosity of the European temperament is intellectual, vital, emotional and imaginative in that sense, and almost the whole strangeness of the Indian use of line and mass, ornament and proportion and rhythm arises from this difference. The two minds live almost in different worlds, are either not looking at the same things or, even where they meet in the object, see it from a different level or surrounded by a different atmosphere, and we know what power the point of view or the medium of vision has to transform the object. And undoubtedly there is very ample ground for Mr. Archer's complaint of the want of naturalism in most Indian sculpture. The inspiration, the way of seeing is frankly not naturalistic, not, that is to say, the vivid, convincing and accurate, the graceful, beautiful or strong, or even the idealised or imaginative imitation of surface or terrestrial nature. The Indian sculptor is concerned with embodying spiritual experiences and impressions, not with recording or glorifying what is received by the physical senses. He may start with suggestions from earthly and physical things, but he produces his work only after he has closed his eyes to the

insistence of the physical circumstances, seen them in the psychic memory and transformed them within himself so as to bring out something other than their physical reality or their vital and intellectual significance. His eye sees the psychic line and turn of things and he replaces by them the material contours. It is not surprising that such a method should produce results which are strange to the average Western mind and eye when these are not liberated by a broad and sympathetic culture. And what is strange to us, is naturally repugnant to our habitual mind and uncouth to our habitual sense, bizarre to our imaginative tradition and aesthetic training. We want what is familiar to the eye and obvious to the imagination and will not readily admit that there may be here another and perhaps greater beauty than that in the circle of which we are accustomed to live and take pleasure.

It seems to be especially the application of this psychic vision to the human form which offends these critics of Indian sculpture. There is the familiar objection to such features as the multiplication of the arms in the figures of gods and goddesses, the four, six, eight or ten arms of Shiva, the eighteen arms of Durga, because they are a monstrosity, a thing not in nature. Now certainly a play of imagination of this kind would be out of place in the representation of a man or woman, because it would have no artistic or other meaning, but I cannot see why this freedom should be denied in the representation of cosmic beings like the Indian godheads. The whole question is, first, whether it is an appropriate means of conveying a significance not otherwise to be represented with an equal power and force and, secondly, whether it is capable of artistic representation, a rhythm of artistic truth and unity which need not be that of physical nature. If not, then it is an ugliness and violence, but if these conditions are satisfied, the means are justified and I do not see that we have any right, faced with the perfection of the work, to raise a discordant clamour. Mr. Archer himself is struck with the perfection of skill and mastery with which these to him superfluous limbs are disposed in the figures of the dancing Shiva, and indeed it would need an eye of impossible blindness

not to see that much, but what is still more important is the artistic significance which this skill is used to serve, and, if that is understood, we can at once see that the spiritual emotion and suggestions of the cosmic dance are brought out by this device in a way which would not be as possible with a two-armed figure. The same truth holds as to the Durga with her eighteen arms slaying the Asuras or the Shivas of the great Pallava creations where the lyrical beauty of the Natarajas is absent, but there is instead a great epical rhythm and grandeur. Art justifies its own means and here it does it with a supreme perfection. And as for the "contorted" postures of some figures, the same law holds. There is often a departure in this respect from the anatomical norm of the physical body or else — and that is a rather different thing — an emphasis more or less pronounced on an unusual pose of limbs or body, and the question then is whether it is done without sense or purpose, a mere clumsiness or an ugly exaggeration, or whether it rather serves some significance and establishes in the place of the normal physical metric of Nature another purposeful and successful artistic rhythm. Art after all is not forbidden to deal with the unusual or to alter and overpass Nature, and it might almost be said that it has been doing little else since it began to serve the human imagination from its first grand epic exaggerations to the violences of modern romanticism and realism, from the high ages of Valmiki and Homer to the day of Hugo and Ibsen. The means matter, but less than the significance and the thing done and the power and beauty with which it expresses the dreams and truths of the human spirit.

The whole question of the Indian artistic treatment of the human figure has to be understood in the light of its aesthetic purpose. It works with a certain intention and ideal, a general norm and standard which permits of a good many variations and from which too there are appropriate departures. The epithets with which Mr. Archer tries to damn its features are absurd, captious, exaggerated, the forced phrases of a journalist trying to depreciate a perfectly sensible, beautiful and aesthetic norm with which he does not sympathise. There are other things here than a repetition of hawk faces, wasp waists, thin legs and the rest of

the ill-tempered caricature. He doubts Mr. Havell's suggestion that these old Indian artists knew the anatomy of the body well enough, as Indian science knew it, but chose to depart from it for their own purpose. It does not seem to me to matter much, since art is not anatomy, nor an artistic masterpiece necessarily a reproduction of physical fact or a lesson in natural science. I see no reason to regret the absence of telling studies in muscles, torsos, etc., for I cannot regard these things as having in themselves any essential artistic value. The one important point is that the Indian artist had a perfect idea of proportion and rhythm and used them in certain styles with nobility and power, in others like the Javan, the Gauda or the southern bronzes with that or with a perfect grace added and often an intense and a lyrical sweetness. The dignity and beauty of the human figure in the best Indian statues cannot be excelled, but what was sought and what was achieved was not an outward naturalistic, but a spiritual and a psychic beauty, and to achieve it the sculptor suppressed, and was entirely right in suppressing, the obtrusive material detail and aimed instead at purity of outline and fineness of feature. And into that outline, into that purity and fineness he was able to work whatever he chose, mass of force or delicacy of grace, a static dignity or a mighty strength or a restrained violence of movement or whatever served or helped his meaning. A divine and subtle body was his ideal; and to a taste and imagination too blunt or realistic to conceive the truth and beauty of his idea, the ideal itself may well be a stumbling-block, a thing of offence. But the triumphs of art are not to be limited by the narrow prejudices of the natural realistic man; that triumphs and endures which appeals to the best, *sādhu-sammatam*, that is deepest and greatest which satisfies the profoundest souls and the most sensitive psychic imaginations.

Each manner of art has its own ideals, traditions, agreed conventions; for the ideas and forms of the creative spirit are many, though there is one ultimate basis. The perspective, the psychic vision of the Chinese and Japanese painters are not the same as those of European artists; but who can ignore the beauty and the wonder of their work? I dare say Mr. Archer would set

a Constable or a Turner above the whole mass of Far Eastern work, as I myself, if I had to make a choice, would take a Chinese or Japanese landscape or other magic transmutation of Nature in preference to all others; but these are matters of individual, national or continental temperament and preference. The essence of the question lies in the rendering of the truth and beauty seized by the spirit. Indian sculpture, Indian art in general follows its own ideal and traditions and these are unique in their character and quality. It is the expression great as a whole through many centuries and ages of creation, supreme at its best, whether in rare early pre-Asokan, in Asokan or later work of the first heroic age or in the magnificent statues of the cave-cathedrals and Pallava and other southern temples or the noble, accomplished or gracious imaginations of Bengal, Nepal and Java through the after centuries or in the singular skill and delicacy of the bronze work of the southern religions, a self-expression of the spirit and ideals of a great nation and a great culture which stands apart in the cast of its mind and qualities among the earth's peoples, famed for its spiritual achievement, its deep philosophies and its religious spirit, its artistic taste, the richness of its poetic imagination, and not inferior once in its dealings with life and its social endeavour and political institutions. This sculpture is a singularly powerful, a seizing and profound interpretation in stone and bronze of the inner soul of that people. The nation, the culture failed for a time in life after a long greatness, as others failed before it and others will yet fail that now flourish; the creations of its mind have been arrested, this art like others has ceased or fallen into decay, but the thing from which it rose, the spiritual fire within still burns and in the renascence that is coming it may be that this great art too will revive, not saddled with the grave limitations of modern Western work in the kind, but vivified by the nobility of a new impulse and power of the ancient spiritual motive. Let it recover, not limited by old forms, but undeterred by the cavillings of an alien mind, the sense of the grandeur and beauty and the inner significance of its past achievement; for in the continuity of its spiritual endeavour lies its best hope for the future.

Indian Art-4

THE ART of painting in ancient and later India, owing to the comparative scantiness of its surviving creations, does not create quite so great an impression as her architecture and sculpture and it has even been supposed that this art flourished only at intervals, finally ceased for a period of several centuries and was revived later on by the Moguls and by Hindu artists who underwent the Mogul influence. This however is a hasty view that does not outlast a more careful research and consideration of the available evidence. It appears, on the contrary, that Indian culture was able to arrive at a well developed and an understanding aesthetic use of colour and line from very early times and, allowing for the successive fluctuations, periods of decline and fresh outbursts of originality and vigour, which the collective human mind undergoes in all countries, used this form of self-expression very persistently through the long centuries of its growth and greatness. And especially it is apparent now that there was a persistent tradition, a fundamental spirit and turn of the aesthetic sense native to the mind of India which links even the latest Rajput art to the earliest surviving work still preserved at its highest summit of achievement in the rock-cut retreats of Ajanta.

The materials of the art of painting are unfortunately more perishable than those of any other of the greater means of creative aesthetic self-expression and of the ancient masterpieces only a little survives, but that little still indicates the immensity of the amount of work of which it is the fading remnant. It is said that of the twenty-nine caves at Ajanta almost all once bore signs of decoration by frescoes; only so long ago as forty years sixteen still contained something of the original paintings, but now six alone still bear their witness to the greatness of this ancient art, though rapidly perishing and deprived of something of the

original warmth and beauty and glory of colour. The rest of all that vivid contemporaneous creation which must at one time have covered the whole country in the temples and viharas and the houses of the cultured and the courts and pleasure-houses of nobles and kings, has perished, and we have only, more or less similar to the work at Ajanta, some crumbling fragments of rich and profuse decoration in the caves of Bagh and a few paintings of female figures in two rock-cut chambers at Sigiriya.¹ These remnants represent the work of some six or seven centuries, but they leave gaps, and nothing now remains of any paintings earlier than the first century of the Christian era, except some frescoes, spoilt by unskilful restoration, from the first century before it, while after the seventh there is a blank which might at first sight argue a total decline of the art, a cessation and disappearance. But there are fortunately evidences which carry back the tradition of the art at one end many centuries earlier and other remains more recently discovered and of another kind outside India and in the Himalayan countries carry it forward at the other end as late as the twelfth century and help us to link it on to the later schools of Rajput painting. The history of the self-expression of the Indian mind in painting covers a period of as much as two millenniums of more or less intense artistic creation and stands on a par in this respect with the architecture and sculpture.

The paintings that remain to us from ancient times are the work of Buddhist painters, but the art itself in India was of pre-Buddhistic origin. The Tibetan historian ascribes a remote antiquity to all the crafts, prior to the Buddha, and this is a conclusion increasingly pointed to by a constant accumulation of evidence. Already in the third century before the Christian era we find the theory of the art well founded from previous times, the six essential elements, *sadanga*, recognised and enumerated, like the more or less corresponding six Chinese canons which are first mentioned nearly a thousand years later, and in a very

¹ Since then more paintings of high quality have been found in some southern temples, akin in their spirit and style to the work at Ajanta.

ancient work on the art pointing back to pre-Buddhistic times a number of careful and very well-defined rules and traditions are laid down which were developed into an elaborate science of technique and traditional rule in the later Shilpasutras. The frequent references in the ancient literature also are of a character which would have been impossible without a widespread practice and appreciation of the art by both men and women of the cultured classes, and these allusions and incidents evidencing a moved delight in the painted form and beauty of colour and the appeal both to the decorative sense and to the aesthetic emotion occur not only in the later poetry of Kalidasa, Bhavabhuti and other classical dramatists, but in the early popular drama of Bhasa and earlier still in the epics and in the sacred books of the Buddhists. The absence of any actual creations of this earlier art makes it indeed impossible to say with absolute certainty what was its fundamental character and intimate source of inspiration or whether it was religious and hieratic or secular in its origin. The theory has been advanced rather too positively that it was in the courts of kings that the art began and with a purely secular motive and inspiration, and it is true that while the surviving work of Buddhist artists is mainly religious in subject or at least links on common scenes of life to Buddhist ceremony and legend, the references in the epic and dramatic literature are usually to painting of a more purely aesthetic character, personal, domestic or civic, portrait painting, the representation of scenes and incidents in the lives of kings and other great personalities or mural decoration of palaces and private or public buildings. On the other hand, there are similar elements in Buddhist painting, as, for example, the portraits of the queens of King Kashyapa at Sigiriya, the historic representation of a Persian embassy or the landing of Vijaya in Ceylon. And we may fairly assume that all along Indian painting both Buddhist and Hindu covered much the same kind of ground as the later Rajput work in a more ample fashion and with a more antique greatness of spirit and was in its ensemble an interpretation of the whole religion, culture and life of the Indian people. The one important and significant thing that emerges is the constant

oneness and continuity of all Indian art in its essential spirit and tradition. Thus the earlier work at Ajanta has been found to be akin to the earlier sculptural work of the Buddhists, while the later paintings have a similar close kinship to the sculptural reliefs at Java. And we find that the spirit and tradition which reigns through all changes of style and manner at Ajanta, is present too at Bagh and Sigiriya, in the Khotan frescoes, in the illuminations of Buddhist manuscripts of a much later time and in spite of the change of form and manner is still spiritually the same in the Rajput paintings. This unity and continuity enable us to distinguish and arrive at a clear understanding of what is the essential aim, inner turn and motive, spiritual method which differentiate Indian painting first from occidental work and then from the nearer and more kindred art of other countries of Asia.

The spirit and motive of Indian painting are in their centre of conception and shaping force of sight identical with the inspiring vision of Indian sculpture. All Indian art is a throwing out of a certain profound self-vision formed by a going within to find out the secret significance of form and appearance, a discovery of the subject in one's deeper self, the giving of soul-form to that vision and a remoulding of the material and natural shape to express the psychic truth of it with the greatest possible purity and power of outline and the greatest possible concentrated rhythmic unity of significance in all the parts of an indivisible artistic whole. Take whatever masterpiece of Indian painting and we shall find these conditions aimed at and brought out into a triumphant beauty of suggestion and execution. The only difference from the other arts comes from the turn natural and inevitable to its own kind of aesthetics, from the moved and indulgent dwelling on what one might call the mobilities of the soul rather than on its static eternities, on the casting out of self into the grace and movement of psychic and vital life (subject always to the reserve and restraint necessary to all art) rather than on the holding back of life in the stabilities of the self and its eternal qualities and principles, guna and tattwa. This distinction is of the very essence of the difference between the work given to the sculptor and the painter, a difference imposed on them by the natural

scope, turn, possibility of their instrument and medium. The sculptor must express always in static form; the idea of the spirit is cut out for him in mass and line, significant in the stability of its insistence, and he can lighten the weight of this insistence but not get rid of it or away from it; for him eternity seizes hold of time in its shapes and arrests it in the monumental spirit of stone or bronze. The painter on the contrary lavishes his soul in colour and there is a liquidity in the form, a fluent grace of subtlety in the line he uses which imposes on him a more mobile and emotional way of self-expression. The more he gives us of the colour and changing form and emotion of the life of the soul, the more his work glows with beauty, masters the inner aesthetic sense and opens it to the thing his art better gives us than any other, the delight of the motion of the self out into a spiritually sensuous joy of beautiful shapes and the coloured radiances of existence. Painting is naturally the most sensuous of the arts, and the highest greatness open to the painter is to spiritualise this sensuous appeal by making the most vivid outward beauty a revelation of subtle spiritual emotion so that the soul and the sense are at harmony in the deepest and finest richness of both and united in their satisfied consonant expression of the inner significances of things and life. There is less of the austerity of Tapasya in his way of working, a less severely restrained expression of eternal things and of the fundamental truths behind the forms of things, but there is in compensation a moved wealth of psychic or warmth of vital suggestion, a lavish delight of the beauty of the play of the eternal in the moments of time and there the artist arrests it for us and makes moments of the life of the soul reflected in form of man or creature or incident or scene or Nature full of a permanent and opulent significance to our spiritual vision. The art of the painter justifies visually to the spirit the search of the sense for delight by making it its own search for the pure intensities of meaning of the universal beauty it has revealed or hidden in creation; the indulgence of the eye's desire in perfection of form and colour becomes an enlightenment of the inner being through the power of a certain spiritually aesthetic Ananda.

The Indian artist lived in the light of an inspiration which imposed this greater aim on his art and his method sprang from its fountains and served it to the exclusion of any more earthly sensuous or outwardly imaginative aesthetic impulse. The six limbs of his art, the *śadanga*, are common to all work in line and colour: they are the necessary elements and in their elements the great arts are the same everywhere; the distinction of forms, *rūpabhedā*, proportion, arrangement of line and mass, design, harmony, perspective, *pramāṇa*, the emotion or aesthetic feeling expressed by the form, *bhāva*, the seeking for beauty and charm for the satisfaction of the aesthetic spirit, *lāvanya*, truth of the form and its suggestion, *sādr̥ṣya*, the turn, combination, harmony of colours, *varṇikābhāṅga*, are the first constituents to which every successful work of art reduces itself in analysis. But it is the turn given to each of the constituents which makes all the difference in the aim and effect of the technique and the source and character of the inner vision guiding the creative hand in their combination which makes all the difference in the spiritual value of the achievement, and the unique character of Indian painting, the peculiar appeal of the art of Ajanta springs from the remarkably inward, spiritual and psychic turn which was given to the artistic conception and method by the pervading genius of Indian culture. Indian painting no more than Indian architecture and sculpture could escape from its absorbing motive, its transmuting atmosphere, the direct or subtle obsession of the mind that has been subtly and strangely changed, the eye that has been trained to see, not as others with only the external eye but by a constant communing of the mental parts and the inner vision with the self beyond mind and the spirit to which forms are only a transparent veil or a slight index of its own greater splendour. The outward beauty and power, the grandeur of drawing, the richness of colour, the aesthetic grace of this painting is too obvious and insistent to be denied, the psychical appeal usually carries something in it to which there is a response in every cultivated and sensitive human mind and the departures from the outward physical norm are less vehement and intense, less disdainful of the more external beauty and

grace,—as is only right in the nature of this art,—than in the sculpture: therefore we find it more easily appreciated up to a certain point by the Western critical mind, and even when not well appreciated, it is exposed to milder objections. There is not the same blank incomprehension or violence of misunderstanding and repulsion. And yet we find at the same time that there is something which seems to escape the appreciation or is only imperfectly understood, and this something is precisely that profounder spiritual intention of which the things the eye and aesthetic sense immediately seize are only the intermediaries. This explains the remark often made about Indian work of the less visibly potent and quieter kind that it lacks inspiration or imagination or is a conventional art: the spirit is missed where it does not strongly impose itself, and is not fully caught even where the power which is put into the expression is too great and direct to allow of denial. Indian painting like Indian architecture and sculpture appeals through the physical and psychical to another spiritual vision from which the artist worked and it is only when this is no less awakened in us than the aesthetic sense that it can be appreciated in all the depth of its significance.

The orthodox Western artist works by a severely conscientious reproduction of the forms of outward Nature; the external world is his model, and he has to keep it before his eye and repress any tendency towards a substantial departure from it or any motion to yield his first allegiance to a subtler spirit. His imagination submits itself to physical Nature even when he brings in conceptions which are more properly of another kingdom, the stress of the physical world is always with him, and the Seer of the subtle, the creator of mental forms, the inner Artist, the wide-eyed voyager in the vaster psychical realms, is obliged to subdue his inspirations to the law of the Seer of the outward, the spirit that has embodied itself in the creations of the terrestrial life, the material universe. An idealised imaginative realism is as far as he can ordinarily go in the method of his work when he would fill the outward with the subtler inner seeing. And when, dissatisfied with this confining law, he would break quite out of the circle, he is exposed to a temptation to stray

into intellectual or imaginative extravagances which violate the universal rule of the right distinction of forms, *rūpabhedā*, and belong to the vision of some intermediate world of sheer fantasy. His art has discovered the rule of proportion, arrangement and perspective which preserves the illusion of physical Nature and he relates his whole design to her design in a spirit of conscientious obedience and faithful dependence. His imagination is a servant or interpreter of her imaginations, he finds in the observation of her universal law of beauty his secret of unity and harmony and his subjectivity tries to discover itself in hers by a close dwelling on the objective shapes she has given to her creative spirit. The farthest he has got in the direction of a more intimately subjective spirit is an impressionism which still waits upon her models but seeks to get at some first inward or original effect of them on the inner sense, and through that he arrives at some more strongly psychical rendering, but he does not work altogether from within outward in the freer manner of the oriental artist. His emotion and artistic feeling move in this form and are limited by this artistic convention and are not a pure spiritual or psychic emotion but usually an imaginative exaltation derived from the suggestions of life and outward things with a psychic element or an evocation of spiritual feeling initiated and dominated by the touch of the outward. The charm that he gives is a sublimation of the beauty that appeals to the outward senses by the power of the idea and the imagination working on the outward sense appeal and other beauty is only brought in by association into that frame. The truth of correspondence he depends upon is a likeness to the creations of physical Nature and their intellectual, emotional and aesthetic significances, and his work of line and wave of colour are meant to embody the flow of this vision. The method of this art is always a transcript from the visible world with such necessary transmutation as the aesthetic mind imposes on its materials. At the lowest to illustrate, at the highest to interpret life and Nature to the mind by identifying it with deeper things through some derivative touch of the spirit that has entered into and subdued itself to

their shapes, *pravisya yaḥ pratirūpo babbhūva*, is the governing principle.²

The Indian artist sets out from the other end of the scale of values of experience which connect life and the spirit. The whole creative force comes here from a spiritual and psychic vision, the emphasis of the physical is secondary and always deliberately lightened so as to give an overwhelmingly spiritual and psychic impression and everything is suppressed which does not serve this purpose or would distract the mind from the purity of this intention. This painting expresses the soul through life, but life is only a means of the spiritual self-expression, and its outward representation is not the first object or the direct motive. There is a real and a very vivid and vital representation, but it is more of an inner psychical than of the outward physical life. A critic of high repute speaking of the Indian influence in a famous Japanese painting fixes on the grand strongly outlined figures and the feeling for life and character recalling the Ajanta frescoes as the signs of its Indian character: but we have to mark carefully the nature of this feeling for life and the origin and intention of this strong outlining of the figures. The feeling for life and character here is a very different thing from the splendid and abundant vitality and the power and force of character which we find in an Italian painting, a fresco from Michael Angelo's hand or a portrait by Titian or Tintoretto. The first primitive object of the art of painting is to illustrate life and Nature and at the lowest this becomes a more or less vigorous and original or conventionally faithful reproduction, but it rises in great hands to a revelation of the glory and beauty of the sensuous appeal of life or of the dramatic power and moving interest of character and emotion and action. That is a common form of aesthetic work in Europe; but in Indian art it is never the governing motive. The sensuous appeal is there, but it is refined into only one and not the chief element of the richness of a soul of psychic grace and beauty which is for the Indian

² All this is no longer true of European art in much of its more prominent recent developments.

artist the true beauty, *lāvanya*: the dramatic motive is subordinated and made only a purely secondary element, only so much is given of character and action as will help to bring out the deeper spiritual or psychic feeling, *bhāva*, and all insistence or too prominent force of these more outwardly dynamic things is shunned, because that would externalise too much the spiritual emotion and take away from its intense purity by the interference of the grosser intensity which emotion puts on in the stress of the active outward nature. The life depicted is the life of the soul and not, except as a form and a helping suggestion, the life of the vital being and the body. For the second more elevated aim of art is the interpretation or intuitive revelation of existence through the forms of life and Nature and it is this that is the starting-point of the Indian motive. But the interpretation may proceed on the basis of the forms already given us by physical Nature and try to evoke by the form an idea, a truth of the spirit which starts from it as a suggestion and returns upon it for support, and the effort is then to correlate the form as it is to the physical eye with the truth which it evokes without overpassing the limits imposed by the appearance. This is the common method of occidental art always zealous for the immediate fidelity to Nature which is its idea of true correspondence, *sādr̤syā*, but it is rejected by the Indian artist. He begins from within, sees in his soul the thing he wishes to express or interpret and tries to discover the right line, colour and design of his intuition which, when it appears on the physical ground, is not a just and reminding reproduction of the line, colour and design of physical nature, but much rather what seems to us a psychical transmutation of the natural figure. In reality the shapes he paints are the forms of things as he has seen them in the psychical plane of experience: these are the soul-figures of which physical things are a gross representation and their purity and subtlety reveals at once what the physical masks by the thickness of its casings. The lines and colours sought here are the psychic lines and the psychic hues proper to the vision which the artist has gone into himself to discover.

This is the whole governing principle of the art which gives its stamp to every detail of an Indian painting and transforms

the artist's use of the six limbs of the canon. The distinction of forms is faithfully observed, but not in the sense of an exact naturalistic fidelity to the physical appearance with the object of a faithful reproduction of the outward shapes of the world in which we live. To recall with fidelity something our eyes have seen or could have seen on the spot, a scene, an interior, a living and breathing person, and give the aesthetic sense and emotion of it to the mind is not the motive. There is here an extraordinary vividness, naturalness, reality, but it is a more than physical reality, a reality which the soul at once recognises as of its own sphere, a vivid naturalness of psychic truth, the convincing spirit of the form to which the soul, not the outward naturalness of the form to which the physical eye bears witness. The truth, the exact likeness is there, the correspondence, *sādṛśya*, but it is the truth of the essence of the form, it is the likeness of the soul to itself, the reproduction of the subtle embodiment which is the basis of the physical embodiment, the purer and finer subtle body of an object which is the very expression of its own essential nature, *svabhāva*. The means by which this effect is produced is characteristic of the inward vision of the Indian mind. It is done by a bold and firm insistence on the pure and strong outline and a total suppression of everything that would interfere with its boldness, strength and purity or would blur over and dilute the intense significance of the line. In the treatment of the human figure all corporeal filling in of the outline by insistence on the flesh, the muscle, the anatomical detail is minimised or disregarded: the strong subtle lines and pure shapes which make the humanity of the human form are alone brought into relief; the whole essential human being is there, the divinity that has taken this garb of the spirit to the eye, but not the superfluous physicality which he carries with him as his burden. It is the ideal psychical figure and body of man and woman that is before us in its charm and beauty. The filling in of the line is done in another way; it is effected by a disposition of pure masses, a design and coloured wave-flow of the body, *bhaṅga*, a simplicity of content that enables the artist to flood the whole with the significance of the one spiritual emotion, feeling, suggestion which he intends

25. The Adoration Group, Ajanta

The simplicity in the greatness and power, the fullness of expression gained by reserve and suppression and concentration which we find here is the perfect method of the classical art of India. (p.310)

to convey, his intuition of the moment of the soul, its living self-experience. All is disposed so as to express that and that alone. The almost miraculously subtle and meaningful use of the hands to express the psychic suggestion is a common and well-marked feature of Indian paintings and the way in which the suggestion of the face and the eyes is subtly repeated or supplemented by this expression of the hands is always one of the first things that strikes the regard, but as we continue to look, we see that every turn of the body, the pose of each limb, the relation and design of all the masses are filled with the same psychical feeling. The more important accessories help it by a kindred suggestion or bring it out by a support or variation or extension or relief of the motive. The same law of significant line and suppression of distracting detail is applied to animal forms, buildings, trees, objects. There is in all the art an inspired harmony of conception, method and expression. Colour too is used as a means for the spiritual and psychic intention, and we can see this well enough if we study the suggestive significance of the hues in a Buddhist miniature. This power of line and subtlety of psychic suggestion in the filling in of the expressive outlines is the source of that remarkable union of greatness and moving grace which is the stamp of the whole work of Ajanta and continues in Rajput painting, though there the grandeur of the earlier work is lost in the grace and replaced by a delicately intense but still bold and decisive power of vivid and suggestive line. It is this common spirit and tradition which is the mark of all the truly indigenous work of India.

These things have to be carefully understood and held in mind when we look at an Indian painting and the real spirit of it first grasped before we condemn or praise. To dwell on that in it which is common to all art is well enough, but it is what is peculiar to India that is its real essence. And there again to appreciate the technique and the fervour of religious feeling is not sufficient; the spiritual intention served by the technique, the psychic significance of line and colour, the greater thing of which the religious emotion is the result has to be felt if we would identify ourself with the whole purpose of the artist. If

we look long, for an example, at the adoration group of the mother and child before the Buddha, one of the most profound, tender and noble of the Ajanta masterpieces, we shall find that the impression of intense religious feeling of adoration there is only the most outward general touch in the ensemble of the emotion. That which it deepens to is the turning of the soul of humanity in love to the benignant and calm Ineffable which has made itself sensible and human to us in the universal compassion of the Buddha, and the motive of the soul moment the painting interprets is the dedication of the awakening mind of the child, the coming younger humanity, to that in which already the soul of the mother has learned to find and fix its spiritual joy. The eyes, brows, lips, face, poise of the head of the woman are filled with this spiritual emotion which is a continued memory and possession of the psychical release, the steady settled calm of the heart's experience filled with an ineffable tenderness, the familiar depths which are yet moved with the wonder and always farther appeal of something that is infinite, the body and other limbs are grave masses of this emotion and in their poise a basic embodiment of it, while the hands prolong it in the dedicative putting forward of her child to meet the Eternal. This contact of the human and eternal is repeated in the smaller figure with a subtly and strongly indicated variation, the glad and childlike smile of awakening which promises but not yet possesses the depths that are to come, the hands disposed to receive and keep, the body in its looser curves and waves harmonising with that significance. The two have forgotten themselves and seem almost to forget or confound each other in that which they adore and contemplate, and yet the dedicating hands unite mother and child in the common act and feeling by their simultaneous gesture of maternal possession and spiritual giving. The two figures have at each point the same rhythm, but with a significant difference. The simplicity in the greatness and power, the fullness of expression gained by reserve and suppression and concentration which we find here is the perfect method of the classical art of India. And by this perfection Buddhist art became not merely an illustration of the religion and an expression of its thought and its religious

feeling, history and legend, but a revealing interpretation of the spiritual sense of Buddhism and its profounder meaning to the soul of India.

To understand that—we must always seek first and foremost this kind of deeper intention—is to understand the reason of the differences between the occidental and the Indian treatment of the life motives. Thus a portrait by a great European painter will express with sovereign power the soul through character, through the active qualities, the ruling powers and passions, the master feeling and temperament, the active mental and vital man: the Indian artist tones down the outward-going dynamic indices and gives only so much of them as will serve to bring out or to modulate something that is more of the grain of the subtle soul, something more static and impersonal of which our personality is at once the mask and the index. A moment of the spirit expressing with purity the permanence of a very subtle soul quality is the highest type of the Indian portrait. And more generally the feeling for character which has been noted as a feature of the Ajanta work is of a similar kind. An Indian painting expressing, let us say, a religious feeling centred on some significant incident will show the expression in each figure varied in such a way as to bring out the universal spiritual essence of the emotion modified by the essential soul type, different waves of the one sea, all complexity of dramatic insistence is avoided, and so much stress only is laid on character in the individual feeling as to give the variation without diminishing the unity of the fundamental emotion. The vividness of life in these paintings must not obscure for us the more profound purpose for which it is the setting, and this has especially to be kept in mind in our view of the later art which has not the greatness of the classic work and runs to a less grave and highly sustained kind, to lyric emotion, minute vividness of life movement, the more naive feelings of the people. One sometimes finds inspiration, decisive power of thought and feeling, originality of creative imagination denied to this later art; but its real difference from that of Ajanta is only that the intermediate psychic transmission between the life movement and the inmost motive has been given

with less power and distinctness: the psychic thought and feeling are there more thrown outward in movement, less contained in the soul, but still the soul motive is not only present but makes the true atmosphere and if we miss it, we miss the real sense of the picture. This is more evident where the inspiration is religious, but it is not absent from the secular subject. Here too spiritual intention or psychic suggestion are the things of the first importance. In Ajanta work they are all-important and to ignore them at all is to open the way to serious errors of interpretation. Thus a highly competent and very sympathetic critic speaking of the painting of the Great Renunciation says truly that this great work excels in its expression of sorrow and feeling of profound pity, but then, looking for what a Western imagination would naturally put into such a subject, he goes on to speak of the weight of a tragic decision, the bitterness of renouncing a life of bliss blended with a yearning sense of hope in the happiness of the future, and that is singularly to misunderstand the spirit in which the Indian mind turns from the transient to the eternal, to mistake the Indian art motive and to put a vital into the place of a spiritual emotion. It is not at all his own personal sorrow but the sorrow of all others, not an emotional self-pity but a poignant pity for the world, not the regret for a life of domestic bliss but the afflicting sense of the unreality of human happiness that is concentrated in the eyes and lips of the Buddha, and the yearning there is not, certainly, for earthly happiness in the future but for the spiritual way out, the anguished seeking which found its release, already foreseen by the spirit behind and hence the immense calm and restraint that support the sorrow, in the true bliss of Nirvana. There is illustrated the whole difference between two kinds of imagination, the mental, vital and physical stress of the art of Europe and the subtle, less forcefully tangible spiritual stress of the art of India.

It is the indigenous art of which this is the constant spirit and tradition, and it has been doubted whether the Mogul paintings deserve that name, have anything to do with that tradition and are not rather an exotic importation from Persia. Almost all oriental art is akin in this respect that the psychic enters into

and for the most part lays its subtler law on the physical vision and the psychic line and significance give the characteristic turn, are the secret of the decorative skill, direct the higher art in its principal motive. But there is a difference between the Persian psychicality which is redolent of the magic of the middle worlds and the Indian which is only a means of transmission of the spiritual vision. And obviously the Indo-Persian style is of the former kind and not indigenous to India. But the Mogul school is not an exotic; there is rather a blending of two mentalities: on the one side there is a leaning to some kind of externalism which is not the same thing as Western naturalism, a secular spirit and certain prominent elements that are more strongly illustrative than interpretative, but the central thing is still the domination of a transforming touch which shows that there as in the architecture the Indian mind has taken hold of another invading mentality and made it a help to a more outward-going self-expression that comes in as a new side strain in the spiritual continuity of achievement which began in prehistoric times and ended only with the general decline of Indian culture. Painting, the last of the arts in that decline to touch the bottom, has also been the first to rise again and lift the dawn fires of an era of new creation.

It is not necessary to dilate on the decorative arts and crafts of India, for their excellence has always been beyond dispute. The generalised sense of beauty which they imply is one of the greatest proofs that there can be of the value and soundness of a national culture. Indian culture in this respect need not fear any comparison: if it is less predominantly artistic than that of Japan, it is because it has put first the spiritual need and made all other things subservient to and a means for the spiritual growth of the people. Its civilisation, standing in the first rank in the three great arts as in all things of the mind, has proved that the spiritual urge is not, as has been vainly supposed, sterilising to the other activities, but a most powerful force for the many-sided development of the human whole.

Indian Literature

THE ARTS which appeal to the soul through the eye are able to arrive at a peculiarly concentrated expression of the spirit, the aesthesis and the creative mind of a people, but it is in its literature that we must seek for its most flexible and many-sided self-expression, for it is the word used in all its power of clear figure or its threads of suggestion that carries to us most subtly and variably the shades and turns and teeming significances of the inner self in its manifestation. The greatness of a literature lies first in the greatness and worth of its substance, the value of its thought and the beauty of its forms, but also in the degree to which, satisfying the highest conditions of the art of speech, it avails to bring out and raise the soul and life or the living and the ideal mind of a people, an age, a culture, through the genius of some of its greatest or most sensitive representative spirits. And if we ask what in both these respects is the achievement of the Indian mind as it has come down to us in the Sanskrit and other literatures, we might surely say that here at least there is little room for any just depreciation and denial even by a mind the most disposed to quarrel with the effect on life and the character of the culture. The ancient and classical creations of the Sanskrit tongue both in quality and in body and abundance of excellence, in their potent originality and force and beauty, in their substance and art and structure, in grandeur and justice and charm of speech and in the height and width of the reach of their spirit stand very evidently in the front rank among the world's great literatures. The language itself, as has been universally recognised by those competent to form a judgment, is one of the most magnificent, the most perfect and wonderfully sufficient literary instruments developed by the human mind, at once majestic and sweet and flexible, strong and clearly-formed and full and vibrant and subtle, and its quality and character would be

of itself a sufficient evidence of the character and quality of the race whose mind it expressed and the culture of which it was the reflecting medium. The great and noble use made of it by poet and thinker did not fall below the splendour of its capacities. Nor is it in the Sanskrit tongue alone that the Indian mind has done high and beautiful and perfect things, though it couched in that language the larger part of its most prominent and formative and grandest creations. It would be necessary for a complete estimate to take into account as well the Buddhistic literature in Pali and the poetic literatures, here opulent, there more scanty in production, of about a dozen Sanskritic and Dravidian tongues. The whole has almost a continental effect and does not fall so far short in the quantity of its really lasting things and equals in its things of best excellence the work of ancient and mediaeval and modern Europe. The people and the civilisation that count among their great works and their great names the Veda and the Upanishads, the mighty structures of the Mahabharata and the Ramayana, Kalidasa and Bhavabhuti and Bhartrihari and Jayadeva and the other rich creations of classical Indian drama and poetry and romance, the Dhammapada and the Jatakas, the Panchatantra, Tulsidas, Vidyapati and Chandidas and Ramprasad, Ramdas and Tukaram, Tiruvalluvar and Kamban and the songs of Nanak and Kabir and Mirabai and the southern Shaiva saints and the Alwars,—to name only the best-known writers and most characteristic productions, though there is a very large body of other work in the different tongues of both the first and the second excellence,—must surely be counted among the greatest civilisations and the world's most developed and creative peoples. A mental activity so great and of so fine a quality commencing more than three thousand years ago and still not exhausted is unique and the best and most undeniable witness to something extraordinarily sound and vital in the culture.

A criticism that ignores or belittles the significance of this unsurpassed record and this splendour of the self-expressing spirit and the creative intelligence, stands convicted at once of a blind malignity or an invincible prejudice and does not merit

refutation. It would be a sheer waste of time and energy to review the objections raised by our devil's advocate: for nothing vital to the greatness of a literature is really in dispute and there is only to the credit of the attack a general distortion and denunciation and a laborious and exaggerated cavilling at details and idiosyncracies which at most show a difference between the idealising mind and abundant imagination of India and the more realistically observant mind and less rich and exuberant imagination of Europe. The fit parallel to this motive and style of criticism would be if an Indian critic who had read European literature only in bad or ineffective Indian translations, were to pass it under a hostile and disparaging review, dismiss the Iliad as a crude and empty semi-savage and primitive epos, Dante's great work as the nightmare of a cruel and superstitious religious fantasy, Shakespeare as a drunken barbarian of considerable genius with an epileptic imagination, the whole drama of Greece and Spain and England as a mass of bad ethics and violent horrors, French poetry as a succession of bald or tawdry rhetorical exercises and French fiction as a tainted and immoral thing, a long sacrifice on the altar of the goddess Lubricity, admit here and there a minor merit, but make no attempt at all to understand the central spirit or aesthetic quality or principle of structure and conclude on the strength of his own absurd method that the ideals of both Pagan and Christian Europe were altogether false and bad and its imagination afflicted with a "habitual and ancestral" earthiness, morbidity, poverty and disorder. No criticism would be worth making on such a mass of absurdities, and in this equally ridiculous philippic only a stray observation or two less inconsequent and opaque than the others perhaps demands a passing notice. But although these futilities do not at all represent the genuine view of the general European mind on the subject of Indian poetry and literature, still one finds a frequent inability to appreciate the spirit or the form or the aesthetic value of Indian writing and especially its perfection and power as an expression of the cultural mind of the people. One meets such criticisms even from sympathetic critics as an admission of the vigour, colour and splendour of Indian poetry followed by a

conclusion that for all that it does not satisfy, and this means that the intellectual and temperamental misunderstanding extends to some degree even to this field of creation where different minds meet more readily than in painting and sculpture, that there is a rift between the two mentalities and what is delightful and packed with meaning and power to the one has no substance, but only a form, of aesthetic or intellectual pleasure for the other. This difficulty is partly due to an inability to enter into the living spirit and feel the vital touch of the language, but partly to a spiritual difference in similarity which is even more baffling than a complete dissimilarity and otherness. Chinese poetry for example is altogether of its own kind and it is more possible for a Western mentality, when it does not altogether pass it by as an alien world, to develop an undisturbed appreciation because the receptivity of the mind is not checked or hampered by any disturbing memories or comparisons. Indian poetry on the contrary, like the poetry of Europe, is the creation of an Aryan or Aryanised national mind, starts apparently from similar motives, moves on the same plane, uses cognate forms, and yet has something quite different in its spirit which creates a pronounced and separating divergence in its aesthetic tones, type of imagination, turn of self-expression, ideative mind, method, form, structure. The mind accustomed to the European idea and technique expects the same kind of satisfaction here and does not meet it, feels a baffling difference to whose secret it is a stranger, and the subtly pursuing comparison and vain expectation stand in the way of a full receptivity and intimate understanding. At bottom it is an insufficient comprehension of the quite different spirit behind, the different heart of this culture that produces the mingled attraction and dissatisfaction. The subject is too large to be dealt with adequately in small limits: I shall only attempt to bring out certain points by a consideration of some of the most representative master works of creative intuition and imagination taken as a record of the soul and mind of the Indian people.

The early mind of India in the magnificent youth of the nation, when a fathomless spiritual insight was at work, a subtle

intuitive vision and a deep, clear and greatly outlined intellectual and ethical thinking and heroic action and creation which founded and traced the plan and made the permanent structure of her unique culture and civilisation, is represented by four of the supreme productions of her genius, the Veda, the Upanishads and the two vast epics, and each of them is of a kind, a form and an intention not easily paralleled in any other literature. The two first are the visible foundation of her spiritual and religious being, the others a large creative interpretation of her greatest period of life, of the ideas that informed and the ideals that governed it and the figures in which she saw man and Nature and God and the powers of the universe. The Veda gave us the first types and figures of these things as seen and formed by an imaged spiritual intuition and psychological and religious experience; the Upanishads constantly breaking through and beyond form and symbol and image without entirely abandoning them, since always they come in as accompaniment or undertone, reveal in a unique kind of poetry the ultimate and unsurpassable truths of self and God and man and the world and its principles and powers in their most essential, their profoundest and most intimate and their most ample realities,—highest mysteries and clarities vividly seen in an irresistible, an unwalled perception that has got through the intuitive and psychological to the sheer spiritual vision. And after that we have powerful and beautiful developments of the intellect and the life and of ideal, ethical, aesthetic, psychic, emotional and sensuous and physical knowledge and idea and vision and experience of which the epics are the early record and the rest of the literature the continuation; but the foundation remains the same throughout, and whatever new and often larger types and significant figures replace the old or intervene to add and modify and alter the whole ensemble, are in their essential build and character transmutations and extensions of the original vision and first spiritual experience and never an unconnected departure. There is a persistence, a continuity of the Indian mind in its literary creation in spite of great changes as consistent as that which we find in painting and sculpture.

The Veda is the creation of an early intuitive and symbolical mentality to which the later mind of man, strongly intellectualised and governed on the one side by reasoning idea and abstract conception, on the other hand by the facts of life and matter accepted as they present themselves to the senses and positive intelligence without seeking in them for any divine or mystic significance, indulging the imagination as a play of the aesthetic fancy rather than as an opener of the doors of truth and only trusting to its suggestions when they are confirmed by the logical reason or by physical experience, aware only of carefully intellectualised intuitions and recalcitrant for the most part to any others, has grown a total stranger. It is not surprising therefore that the Veda should have become unintelligible to our minds except in its most outward shell of language, and that even very imperfectly known owing to the obstacle of an antique and ill-understood diction, and that the most inadequate interpretations should be made which reduce this great creation of the young and splendid mind of humanity to a botched and defaced scrawl, an incoherent hotch-potch of the absurdities of a primitive imagination perplexing what would be otherwise the quite plain, flat and common record of a naturalistic religion which mirrored only and could only minister to the crude and materialistic desires of a barbaric life mind. The Veda became to the later scholastic and ritualistic idea of Indian priests and pundits nothing better than a book of mythology and sacrificial ceremonies; European scholars seeking in it for what was alone to them of any rational interest, the history, myths and popular religious notions of a primitive people, have done yet worse wrong to the Veda and by insisting on a wholly external rendering still farther stripped it of its spiritual interest and its poetic greatness and beauty.

But this was not what it was to the Vedic Rishis themselves or to the great seers and thinkers who came after them and developed out of their pregnant and luminous intuitions their own wonderful structures of thought and speech built upon an unexampled spiritual revelation and experience. The Veda was

to these early seers the Word discovering the Truth and clothing in image and symbol the mystic significances of life. It was a divine discovery and unveiling of the potencies of the word, of its mysterious revealing and creative capacity, not the word of the logical and reasoning or the aesthetic intelligence, but the intuitive and inspired rhythmic utterance, the mantra. Image and myth were freely used, not as an imaginative indulgence, but as living parables and symbols of things that were very real to their speakers and could not otherwise find their own intimate and native shape in utterance, and the imagination itself was a priest of greater realities than those that meet and hold the eye and mind limited by the external suggestions of life and the physical existence. This was their idea of the sacred poet, a mind visited by some highest light and its forms of idea and word, a seer and hearer of the Truth, *kavayah satyaśrutah*. The poets of the Vedic verse certainly did not regard their function as it is represented by modern scholars, they did not look on themselves as a sort of superior medicine-men and makers of hymn and incantation to a robust and barbarous tribe, but as seers and thinkers, *r̥si, dhīra*. These singers believed that they were in possession of a high, mystic and hidden truth, claimed to be the bearers of a speech acceptable to a divine knowledge, and expressly so speak of their utterances, as secret words which declare their whole significance only to the seer, *kavaye nivacanā ninyā vacāṁsi*. And to those who came after them the Veda was a book of knowledge, and even of the supreme knowledge, a revelation, a great utterance of eternal and impersonal truth as it had been seen and heard in the inner experience of inspired and semi-divine thinkers. The smallest circumstances of the sacrifice around which the hymns were written were intended to carry a symbolic and psychological power of significance, as was well known to the writers of the ancient Brahmanas. The sacred verses, each by itself held to be full of a divine meaning, were taken by the thinkers of the Upanishads as the profound and pregnant seed-words of the truth they sought and the highest authority they could give for their own sublime utterances was a supporting citation from their predecessors with the formula,

tad esā ṛcābhvuktā, "This is that word which was spoken by the Rig Veda." Western scholars choose to imagine that the successors of the Vedic Rishis were in error, that, except for some later hymns, they put a false and non-existent meaning into the old verses and that they themselves, divided from the Rishis not only by ages of time but by many gulfs and separating seas of an intellectualised mentality, know infinitely better. But mere common sense ought to tell us that those who were so much nearer in both ways to the original poets had a better chance of holding at least the essential truth of the matter and suggests at least the strong probability that the Veda was really what it professes to be, the seeking for a mystic knowledge, the first form of the constant attempt of the Indian mind, to which it has always been faithful, to look beyond the appearances of the physical world and through its own inner experiences to the godheads, powers, self-existence of the One of whom the sages speak variously—the famous phrase in which the Veda utters its own central secret, *ekam sad viprā bahudhā vadanti*.

The real character of the Veda can best be understood by taking it anywhere and rendering it straightforwardly according to its own phrases and images. A famous German scholar rating from his high pedestal of superior intelligence the silly persons who find sublimity in the Veda, tells us that it is full of childish, silly, even monstrous conceptions, that it is tedious, low, commonplace, that it represents human nature on a low level of selfishness and worldliness and that only here and there are a few rare sentiments that come from the depths of the soul. It may be made so if we put our own mental conceptions into the words of the Rishis, but if we read them as they are without any such false translation into what we think early barbarians ought to have said and thought, we shall find instead a sacred poetry sublime and powerful in its words and images, though with another kind of language and imagination than we now prefer and appreciate, deep and subtle in its psychological experience and stirred by a moved soul of vision and utterance. Hear rather the word itself of the Veda.

States upon states are born, covering over covering¹ awakens to knowledge: in the lap of the mother he wholly sees. They have called to him, getting a wide knowledge, they guard sleeplessly the strength, they have entered into the strong city. The peoples born on earth increase the luminous (force) of the son of the White Mother; he has gold on his neck, he is large of speech, he is as if by (the power of) this honey wine a seeker of plenty. He is like pleasant and desirable milk, he is a thing uncompanioned and is with the two who are companions and is as a heat that is the belly of plenty and is invincible and an overcomer of many. Play, O Ray, and manifest thyself.²

Or again in the succeeding hymn,—

Those (flames) of thee, the forceful (godhead), that move not and are increased and puissant, uncling the hostility and crookedness of one who has another law. O Fire, we choose thee for our priest and the means of effectuation of our strength and in the sacrifices bringing the food of thy pleasure we call thee by the word. . . . O god of perfect works, may we be for the felicity, for the truth, revelling with the rays, revelling with the heroes.

And finally let us take the bulk of the third hymn that follows couched in the ordinary symbols of the sacrifice,—

As the Manu we set thee in thy place, as the Manu we kindle thee: O Fire, O Angiras, as the Manu sacrifice to the gods for him who desires the godheads. O Fire, well pleased thou art kindled in the human being and the ladles go to thee continually. . . . Thee all the gods with one pleasure (in thee) made their messenger and serving thee, O seer, (men) in the sacrifices adore the god. Let the mortal adore the divine Fire with sacrifice

¹ Or, “the coverer of the coverer”.

² Literally, “become towards us”.

to the godheads. Kindled, flame forth, O Bright One. Sit in the seat of Truth, sit in the seat of peace.³

That, whatever interpretation we choose to put on its images, is a mystic and symbolic poetry and that is the real Veda.

The character of Vedic poetry apparent from these typical verses need not surprise or baffle us when we see what will be evident from a comparative study of Asiatic literature, that though distinguished by its theory and treatment of the Word, its peculiar system of images and the complexity of its thought and symbolised experience, it is in fact the beginning of a form of symbolic or figurative imagery for the poetic expression of spiritual experience which reappears constantly in later Indian writing, the figures of the Tantras and Puranas, the figures of the Vaishnava poets,—one might add even a certain element in the modern poetry of Tagore,—and has its kindred movements in certain Chinese poets and in the images of the Sufis. The poet has to express a spiritual and psychical knowledge and experience and he cannot do it altogether or mainly in the more abstract language of the philosophical thinker, for he has to bring out, not the naked idea of it, but as vividly as possible its very life and most intimate touches. He has to reveal in one way or another a whole world within him and the quite inner and spiritual significances of the world around him and also, it may well be, godheads, powers, visions and experiences of planes of consciousness other than the one with which our normal minds are familiar. He uses or starts with the images taken from his own normal and outward life and that of humanity and from visible Nature, and though they do not of themselves actually express, yet obliges them to express by implication or to figure the spiritual and psychic idea and experience. He takes them selecting freely his notation of images according to his insight or imagination and transmutes them into instruments of another significance and at the same time pours a direct spiritual

³ I have translated these passages with as close a literalness as the English language will admit. Let the reader compare the original and judge whether this is not the sense of the verses.

meaning into the Nature and life to which they belong, applies outward figures to inner things and brings out their latent and inner spiritual or psychic significance into life's outward figures and circumstances. Or an outward figure nearest to the inward experience, its material counterpart, is taken throughout and used with such realism and consistency that while it indicates to those who possess it the spiritual experience, it means only the external thing to others,—just as the Vaishnava poetry of Bengal makes to the devout mind a physical and emotional image or suggestion of the love of the human soul for God, but to the profane is nothing but a sensuous and passionate love poetry hung conventionally round the traditional human-divine personalities of Krishna and Radha. The two methods may meet together, the fixed system of outward images be used as the body of the poetry, while freedom is often taken to pass their first limits, to treat them only as initial suggestions and transmute subtly or even cast them aside or subdue into a secondary strain or carry them out of themselves so that the translucent veil they offer to our minds lifts from or passes into the open revelation. The last is the method of the Veda and it varies according to the passion and stress of the sight in the poet or the exaltation of his utterance.

The poets of the Veda had another mentality than ours, their use of their images is of a peculiar kind and an antique cast of vision gives a strange outline to their substance. The physical and the psychical worlds were to their eyes a manifestation and a twofold and diverse and yet connected and similar figure of cosmic godheads, the inner and outer life of man a divine commerce with the gods, and behind was the one spirit or being of which the gods were names and personalities and powers. These godheads were at once masters of physical Nature and its principles and forms their godheads and their bodies and inward divine powers with their corresponding states and energies born in our psychic being because they are the soul powers of the cosmos, the guardians of truth and immortality, the children of the Infinite, and each of them too is in his origin and his last reality the supreme Spirit putting in front one of his aspects. The life of

man was to these seers a thing of mixed truth and falsehood, a movement from mortality to immortality, from mixed light and darkness to the splendour of a divine Truth whose home is above in the Infinite but which can be built up here in man's soul and life, a battle between the children of light and the sons of Night, a getting of treasure, of the wealth, the booty given by the gods to the human warrior, and a journey and a sacrifice; and of these things they spoke in a fixed system of images taken from Nature and from the surrounding life of the war-like, pastoral and agricultural Aryan peoples and centred round the cult of Fire and the worship of the powers of living Nature and the institution of sacrifice. The details of outward existence and of the sacrifice were in their life and practice symbols, and in their poetry not dead symbols or artificial metaphors, but living and powerful suggestions and counterparts of inner things. And they used too for their expression a fixed and yet variable body of other images and a glowing web of myth and parable, images that became parables, parables that became myths and myths that remained always images, and yet all these things were to them, in a way that can only be understood by those who have entered into a certain order of psychic experience, actual realities. The physical melted its shades into the lustres of the psychic, the psychic deepened into the light of the spiritual and there was no sharp dividing line in the transition, but a natural blending and intershading of their suggestions and colours. It is evident that a poetry of this kind, written by men with this kind of vision or imagination, cannot either be interpreted or judged by the standards of a reason and taste observant only of the canons of the physical existence. The invocation "Play, O Ray, and become towards us" is at once a suggestion of the leaping up and radiant play of the potent sacrificial flame on the physical altar and of a similar psychical phenomenon, the manifestation of the saving flame of a divine power and light within us. The Western critic sneers at the bold and reckless and to him monstrous image in which Indra son of earth and heaven is said to create his own father and mother; but if we remember that Indra is the supreme spirit in one of its eternal and constant aspects, creator of earth

and heaven, born as a cosmic godhead between the mental and physical worlds and recreating their powers in man, we shall see that the image is not only a powerful but in fact a true and revealing figure, and in the Vedic technique it does not matter that it outrages the physical imagination since it expresses a greater actuality as no other figure could have done with the same awakening aptness and vivid poetical force. The Bull and Cow of the Veda, the shining herds of the Sun lying hidden in the cave are strange enough creatures to the physical mind, but they do not belong to the earth and in their own plane they are at once images and actual things and full of life and significance. It is in this way that throughout we must interpret and receive the Vedic poetry according to its own spirit and vision and the psychically natural, even if to us strange and supranatural, truth of its ideas and figures.

The Veda thus understood stands out, apart from its interest as the world's first yet extant Scripture, its earliest interpretation of man and the Divine and the universe, as a remarkable, a sublime and powerful poetic creation. It is in its form and speech no barbaric production. The Vedic poets are masters of a consummate technique, their rhythms are carved like chariots of the gods and borne on divine and ample wings of sound, and are at once concentrated and wide-waved, great in movement and subtle in modulation, their speech lyric by intensity and epic by elevation, an utterance of great power, pure and bold and grand in outline, a speech direct and brief in impact, full to overflowing in sense and suggestion so that each verse exists at once as a strong and sufficient thing in itself and takes its place as a large step between what came before and what comes after. A sacred and hieratic tradition faithfully followed gave them both their form and substance, but this substance consisted of the deepest psychic and spiritual experiences of which the human soul is capable and the forms seldom or never degenerate into a convention, because what they are intended to convey was lived in himself by each poet and made new to his own mind in expression by the subtleties or sublimities of his individual vision. The utterances of the greatest seers, Vishwamitra, Vamadeva,

Dirghatamas and many others, touch the most extraordinary heights and amplitudes of a sublime and mystic poetry and there are poems like the Hymn of Creation that move in a powerful clarity on the summits of thought on which the Upanishads lived constantly with a more sustained breathing. The mind of ancient India did not err when it traced back all its philosophy, religion and essential things of its culture to these seer-poets, for all the future spirituality of her people is contained there in seed or in first expression.

It is one great importance of a right understanding of the Vedic hymns as a form of sacred literature that it helps us to see the original shaping not only of the master ideas that governed the mind of India, but of its characteristic types of spiritual experience, its turn of imagination, its creative temperament and the kind of significant forms in which it persistently interpreted its sight of self and things and life and the universe. It is in a great part of the literature the same turn of inspiration and self-expression that we see in the architecture, painting and sculpture. Its first character is a constant sense of the infinite, the cosmic, and of things as seen in or affected by the cosmic vision, set in or against the amplitude of the one and infinite; its second peculiarity is a tendency to see and render its spiritual experience in a great richness of images taken from the inner psychic plane or in physical images transmuted by the stress of a psychic significance and impression and line and idea colour; and its third tendency is to image the terrestrial life often magnified, as in the Mahabharata and Ramayana, or else subtilised in the transparencies of a larger atmosphere, attended by a greater than the terrestrial meaning or at any rate presented against the background of the spiritual and psychic worlds and not alone in its own separate figure. The spiritual, the infinite is near and real and the gods are real and the worlds beyond not so much beyond as immanent in our own existence. That which to the Western mind is myth and imagination is here an actuality and a strand of the life of our inner being, what is there beautiful poetic idea and philosophic speculation is here a thing constantly realised and present to the experience. It is this turn of the Indian

mind, its spiritual sincerity and psychic positivism, that makes the Veda and Upanishads and the later religious and religio-philosophic poetry so powerful in inspiration and intimate and living in expression and image, and it has its less absorbing but still very sensible effect on the working of the poetic idea and imagination even in the more secular literature.

Indian Literature–2

THE UPANISHADS are the supreme work of the Indian mind, and that it should be so, that the highest self-expression of its genius, its sublimest poetry, its greatest creation of the thought and word should be not a literary or poetical masterpiece of the ordinary kind, but a large flood of spiritual revelation of this direct and profound character, is a significant fact, evidence of a unique mentality and unusual turn of spirit. The Upanishads are at once profound religious scriptures,—for they are a record of the deepest spiritual experiences,—documents of revelatory and intuitive philosophy of an inexhaustible light, power and largeness and, whether written in verse or cadenced prose, spiritual poems of an absolute, an unfailing inspiration inevitable in phrase, wonderful in rhythm and expression. It is the expression of a mind in which philosophy and religion and poetry are made one, because this religion does not end with a cult nor is limited to a religio-ethical aspiration, but rises to an infinite discovery of God, of Self, of our highest and whole reality of spirit and being and speaks out of an ecstasy of luminous knowledge and an ecstasy of moved and fulfilled experience, this philosophy is not an abstract intellectual speculation about Truth or a structure of the logical intelligence, but Truth seen, felt, lived, held by the inmost mind and soul in the joy of utterance of an assured discovery and possession, and this poetry is the work of the aesthetic mind lifted up beyond its ordinary field to express the wonder and beauty of the rarest spiritual self-vision and the profoundest illumined truth of self and God and universe. Here the intuitive mind and intimate psychological experience of the Vedic seers passes into a supreme culmination in which the Spirit, as is said in a phrase of the Katha Upanishad, discloses its own very body, reveals the very word of its self-expression and discovers to

the mind the vibration of rhythms which repeating themselves within in the spiritual hearing seem to build up the soul and set it satisfied and complete on the heights of self-knowledge.

This character of the Upanishads needs to be insisted upon with a strong emphasis, because it is ignored by foreign translators who seek to bring out the intellectual sense without feeling the life of thought vision and the ecstasy of spiritual experience which made the ancient verses appear then and still make them to those who can enter into the element in which these utterances move, a revelation not to the intellect alone, but to the soul and the whole being, make of them in the old expressive word not intellectual thought and phrase, but Sruti, spiritual audience, an inspired Scripture. The philosophical substance of the Upanishads demands at this day no farther stress of appreciation of its value; for even if the amplest acknowledgement by the greatest minds were wanting, the whole history of philosophy would be there to offer its evidence. The Upanishads have been the acknowledged source of numerous profound philosophies and religions that flowed from it in India like her great rivers from their Himalayan cradle fertilising the mind and life of the people and kept its soul alive through the long procession of the centuries, constantly returned to for light, never failing to give fresh illumination, a fountain of inexhaustible life-giving waters. Buddhism with all its developments was only a restatement, although from a new standpoint and with fresh terms of intellectual definition and reasoning, of one side of its experience and it carried it thus changed in form but hardly in substance over all Asia and westward towards Europe. The ideas of the Upanishads can be rediscovered in much of the thought of Pythagoras and Plato and form the profoundest part of Neo-platonism and Gnosticism with all their considerable consequences to the philosophical thinking of the West, and Sufism only repeats them in another religious language. The larger part of German metaphysics is little more in substance than an intellectual development of great realities more spiritually seen in this ancient teaching, and modern thought is rapidly absorbing them with a closer, more living and intense receptiveness which

promises a revolution both in philosophical and in religious thinking; here they are filtering in through many indirect influences, there slowly pouring through direct and open channels. There is hardly a main philosophical idea which cannot find an authority or a seed or indication in these antique writings — the speculations, according to a certain view, of thinkers who had no better past or background to their thought than a crude, barbaric, naturalistic and animistic ignorance. And even the larger generalisations of Science are constantly found to apply to the truth of physical Nature formulas already discovered by the Indian sages in their original, their largest meaning in the deeper truth of the spirit.

And yet these works are not philosophical speculations of the intellectual kind, a metaphysical analysis which labours to define notions, to select ideas and discriminate those that are true, to logicise truth or else to support the mind in its intellectual preferences by dialectical reasoning and is content to put forward an exclusive solution of existence in the light of this or that idea of the reason and see all things from that viewpoint, in that focus and determining perspective. The Upanishads could not have had so undying a vitality, exercised so unfailing an influence, produced such results or seen now their affirmations independently justified in other spheres of inquiry and by quite opposite methods, if they had been of that character. It is because these seers saw Truth rather than merely thought it, clothed it indeed with a strong body of intuitive idea and disclosing image, but a body of ideal transparency through which we look into the illimitable, because they fathomed things in the light of self-existence and saw them with the eye of the Infinite, that their words remain always alive and immortal, of an inexhaustible significance, an inevitable authenticity, a satisfying finality that is at the same time an infinite commencement of truth, to which all our lines of investigation when they go through to their end arrive again and to which humanity constantly returns in its minds and its ages of greatest vision. The Upanishads are Vedanta, a book of knowledge in a higher degree even than the Vedas, but knowledge in the profounder Indian sense of

the word, Jnana. Not a mere thinking and considering by the intelligence, the pursuit and grasping of a mental form of truth by the intellectual mind, but a seeing of it with the soul and a total living in it with the power of the inner being, a spiritual seizing by a kind of identification with the object of knowledge is Jnana. And because it is only by an integral knowing of the self that this kind of direct knowledge can be made complete, it was the self that the Vedantic sages sought to know, to live in and to be one with it by identity. And through this endeavour they came easily to see that the self in us is one with the universal self of all things and that this self again is the same as God and Brahman, a transcendent Being or Existence, and they beheld, felt, lived in the inmost truth of all things in the universe and the inmost truth of man's inner and outer existence by the light of this one and unifying vision. The Upanishads are epic hymns of self-knowledge and world-knowledge and God-knowledge. The great formulations of philosophic truth with which they abound are not abstract intellectual generalisations, things that may shine and enlighten the mind, but do not live and move the soul to ascension, but are ardours as well as lights of an intuitive and revelatory illumination, teachings as well as seeings of the one Existence, the transcendent Godhead, the divine and universal Self and discoveries of his relation with things and creatures in this great cosmic manifestation. Chants of inspired knowledge, they breathe like all hymns a tone of religious aspiration and ecstasy, not of the narrowly intense kind proper to a lesser religious feeling, but raised beyond cult and special forms of devotion to the universal Ananda of the Divine which comes to us by approach to and oneness with the self-existent and universal spirit. And though mainly concerned with an inner vision and not directly with outward human action, all the highest ethics of Buddhism and later Hinduism are still emergences of the very life and significance of the truths to which they give expressive form and force, — and there is something greater than any ethical precept and mental rule of virtue, the supreme ideal of a spiritual action founded on oneness with God and all living beings. Therefore even when the life of the forms of the

Vedic cult had passed away, the Upanishads still remained alive and creative and could generate the great devotional religions and motive the persistent Indian idea of the Dharma.

The Upanishads are the creation of a revelatory and intuitive mind and its illumined experience, and all their substance, structure, phrase, imagery, movement are determined by and stamped with this original character. These supreme and all-embracing truths, these visions of oneness and self and a universal divine being are cast into brief and monumental phrases which bring them at once before the soul's eye and make them real and imperative to its aspiration and experience or are couched in poetic sentences full of revealing power and suggestive thought-colour that discover a whole infinite through a finite image. The One is there revealed, but also disclosed the many aspects, and each is given its whole significance by the amplitude of the expression and finds as if in a spontaneous self-discovery its place and its connection by the illuminating justness of each word and all the phrase. The largest metaphysical truths and the subtlest subtleties of psychological experience are taken up into the inspired movement and made at once precise to the seeing mind and loaded with unending suggestion to the discovering spirit. There are separate phrases, single couplets, brief passages which contain each in itself the substance of a vast philosophy and yet each is only thrown out as a side, an aspect, a portion of the infinite self-knowledge. All here is a packed and pregnant and yet perfectly lucid and luminous brevity and an immeasurable completeness. A thought of this kind cannot follow the tardy, careful and diffuse development of the logical intelligence. The passage, the sentence, the couplet, the line, even the half line follows the one that precedes with a certain interval full of an unexpressed thought, an echoing silence between them, a thought which is carried in the total suggestion and implied in the step itself, but which the mind is left to work out for its own profit, and these intervals of pregnant silence are large, the steps of this thought are like the paces of a Titan striding from rock to distant rock across infinite waters. There is a perfect totality, a comprehensive connection of harmonious parts in the structure

of each Upanishad; but it is done in the way of a mind that sees masses of truth at a time and stops to bring only the needed word out of a filled silence. The rhythm in verse or cadenced prose corresponds to the sculpture of the thought and the phrase. The metrical forms of the Upanishads are made up of four half lines each clearly cut, the lines mostly complete in themselves and integral in sense, the half lines presenting two thoughts or distinct parts of a thought that are wedded to and complete each other, and the sound movement follows a corresponding principle, each step brief and marked off by the distinctness of its pause, full of echoing cadences that remain long vibrating in the inner hearing: each is as if a wave of the infinite that carries in it the whole voice and rumour of the ocean. It is a kind of poetry—word of vision, rhythm of the spirit,—that has not been written before or after.

The imagery of the Upanishads is in large part developed from the type of imagery of the Veda and though very ordinarily it prefers an unveiled clarity of directly illuminative image, not unoften also it uses the same symbols in a way that is closely akin to the spirit and to the less technical part of the method of the older symbolism. It is to a great extent this element no longer seizable by our way of thinking that has baffled certain Western scholars and made them cry out that these scriptures are a mixture of the sublimest philosophical speculations with the first awkward stammerings of the child mind of humanity. The Upanishads are not a revolutionary departure from the Vedic mind and its temperament and fundamental ideas, but a continuation and development and to a certain extent an enlarging transformation in the sense of bringing out into open expression all that was held covered in the symbolic Vedic speech as a mystery and a secret. It begins by taking up the imagery and the ritual symbols of the Veda and the Brahmanas and turning them in such a way as to bring out an inner and a mystic sense which will serve as a sort of psychical starting-point for its own more highly evolved and more purely spiritual philosophy. There are a number of passages especially in the prose Upanishads which are entirely of this kind and deal, in a manner recondite, obscure

and even unintelligible to the modern understanding, with the psychic sense of ideas then current in the Vedic religious mind, the distinction between the three kinds of Veda, the three worlds and other similar subjects; but, leading as they do in the thought of the Upanishads to deepest spiritual truths, these passages cannot be dismissed as childish aberrations of the intelligence void of sense or of any discoverable bearing on the higher thought in which they culminate. On the contrary we find that they have a deep enough significance once we can get inside their symbolic meaning. That appears in a psycho-physical passing upward into a psycho-spiritual knowledge for which we would now use more intellectual, less concrete and imaged terms, but which is still valid for those who practise Yoga and rediscover the secrets of our psycho-physical and psycho-spiritual being. Typical passages of this kind of peculiar expression of psychic truths are Ajatashatru's explanation of sleep and dream or the passages of the Prasna Upanishad on the vital principle and its motions, or those in which the Vedic idea of the struggle between the Gods and the demons is taken up and given its spiritual significance and the Vedic godheads more openly than in Rik and Saman characterised and invoked in their inner function and spiritual power.

I may cite as an example of this development of Vedic idea and image a passage of the Taittiriya in which Indra plainly appears as the power and godhead of the divine mind:

He who is the Bull of the Vedas of the universal form, he
who was born in the sacred rhythms from the Immortal,
— may Indra satisfy me through the intelligence. O God,
may I become a vessel of the Immortal. May my body
be full of vision and my tongue of sweetness, may I hear
the much and vast with my ears. For thou art the sheath
of Brahman covered over and hidden by the intelligence.

And a kindred passage may also be cited from the Isha in which Surya the Sun-God is invoked as the godhead of knowledge whose supreme form of effulgence is the oneness of the Spirit and his rays dispersed here on the mental level are the shining

diffusion of the thought mind and conceal his own infinite supra-mental truth, the body and self of this Sun, the truth of the spirit and the Eternal:

The face of the Truth is covered with a golden lid: O fostering Sun, that uncover for the law of the truth, for sight. O fosterer, O sole Rishi, O controlling Yama, O Surya, O son of the Father of creatures, marshal and mass thy rays: the Lustre that is thy most blessed form of all, that I see, He who is this, this Purusha, He am I.

The kinship in difference of these passages with the imagery and style of the Veda is evident and the last indeed paraphrases or translates into a later and more open style a Vedic verse of the Atris:

Hidden by your truth is the Truth that is constant for ever where they unyoke the horses of the Sun. There the ten thousands stand together, That is the One: I have seen the supreme Godhead of the embodied gods.

This Vedic and Vedantic imagery is foreign to our present mentality which does not believe in the living truth of the symbol, because the revealing imagination intimidated by the intellect has no longer the courage to accept, identify itself with and boldly embody a psychic and spiritual vision; but it is certainly very far from being a childish or a primitive and barbarous mysticism; this vivid, living, luminously poetic intuitive language is rather the natural expression of a highly evolved spiritual culture.

The intuitive thought of the Upanishads starts from this concrete imagery and these symbols, first to the Vedic Rishis secret seer words wholly expressive to the mind of the seer but veils of their deepest sense to the ordinary intelligence, link them to a less covertly expressive language and pass beyond them to another magnificently open and sublime imagery and diction which at once reveals the spiritual truth in all its splendour. The prose Upanishads show us this process of the early mind of India at its work using the symbol and then passing beyond it to the

overt expression of the spiritual significance. A passage of the Prasna Upanishad on the power and significance of the mystic syllable AUM illustrates the earlier stage of the process:

This syllable OM, O Satyakama, it is the supreme and it is the lower Brahman. Therefore the man of knowledge passeth by this house of the Brahman to the one or the other. And if one meditate on the single letter, he getteth by it knowledge and soon he attaineth on the earth. And him the Riks lead to the world of men and there perfected in Tapas and Brahmacharya and faith he experienceth the greatness of the spirit. Now if by the double letter he is accomplished in the mind, then is he led up by the Yajus to the middle world, to the moon-world of Soma. He in the world of Soma experienceth the majesty of the spirit and returneth again. And he who by the triple letter again, even this syllable OM, shall meditate on the highest Purusha, is perfected in the light that is the Sun. As a snake putteth off its skin, even so is he released from sin and evil and is led by the Samans to the world of Brahman. He from this dense of living souls seeth the higher than the highest Purusha who lieth in this mansion. The three letters are afflicted by death, but now they are used undivided and united to each other, then are the inner and the outer and the middle action of the spirit made whole in their perfect using and the spirit knows and is not shaken. This world by the Riks, the middle world by the Yajus and by the Samans that which the seers make known to us. The man of knowledge passeth to Him by OM, his house, even to the supreme spirit that is calm and ageless and fearless and immortal.

The symbols here are still obscure to our intelligence, but indications are given which show beyond doubt that they are representations of a psychical experience leading to different states of spiritual realisation and we can see that these are three, outward, mental and supramental, and as the result of the last a

supreme perfection, a complete and integral action of the whole being in the tranquil eternity of the immortal Spirit. And later in the Mandukya Upanishad the other symbols are cast aside and we are admitted to the unveiled significance. Then there emerges a knowledge to which modern thought is returning through its own very different intellectual, rational and scientific method, the knowledge that behind the operations of our outward physical consciousness are working the operations of another, subliminal,—another and yet the same,—of which our waking mind is a surface action, and above—perhaps, we still say—is a spiritual superconsciousness in which can be found, it may well be, the highest state and the whole secret of our being. We shall see, when we look closely at the passage of the Prasna Upanishad, that this knowledge is already there, and I think we can very rationally conclude that these and similar utterances of the ancient sages, however perplexing their form to the rational mind, cannot be dismissed as a childish mysticism, but are the imaged expression, natural to the mentality of the time, of what the reason itself by its own processes is now showing us to be true and a very profound truth and real reality of knowledge.

The metrical Upanishads continue this highly charged symbolism but carry it more lightly and in the bulk of their verses pass beyond this kind of image to the overt expression. The Self, the Spirit, the Godhead in man and creatures and Nature and all this world and in other worlds and beyond all cosmos, the Immortal, the One, the Infinite is hymned without veils in the splendour of his eternal transcendence and his manifold self-revelation. A few passages from the teachings of Yama, lord of the Law and of Death, to Nachiketas, will be enough to illustrate something of their character.

OM is this syllable. This syllable is the Brahman, this syllable is the Supreme. He who knoweth the imperishable OM, whatso he willeth, it is his. This support is the best, this support is the highest; and when a man knoweth it, he is greatened in the world of Brahman. The omniscient is not born, nor dies, nor has he come into being from

anywhere, nor is he anyone. He is unborn, he is constant and eternal, he is the Ancient of Days who is not slain in the slaying of the body. . . .

He is seated and journeys far, and lying still he goes to every side. Who other than I should know this ecstatic Godhead? The wise man cometh to know the great Lord and Self established and bodiless in these bodies that pass and has grief no longer. This Self is not to be won by teaching nor by brain-power nor by much learning: he whom the Spirit chooses, by him alone it can be won, and to him this Spirit discloses its own very body. One who has not ceased from ill-doing, one who is not concentrated and calm, one whose mind is not tranquil, shall not get him by the brain's wisdom. He of whom warriors and sages are the food and death is the spice of his banquet, who knoweth where is He? . . .

The Self-born has cloven his doors outward, therefore man sees outward and not in the inner self: only a wise man here and there turns his eyes inward, desiring immortality, and looks on the Self face to face. The child minds follow after surface desires and fall into the net of death which is spread wide for us; but the wise know of immortality and ask not from things inconstant that which is constant. One knoweth by this Self form and taste and odour and touch and its pleasures and what then is here left over? The wise man cometh to know the great Lord and Self by whom one seeth all that is in the soul that wakes and all that is in the soul that dreams and hath grief no longer. He who knoweth the Self, the eater of sweetness close to the living being, the lord of what was and what will be, shrinks thereafter from nothing that is. He knoweth him who is that which was born of old from Tapas and who was born of old from the waters and hath entered in and standeth in the secret cavern of being with all these creatures. He knoweth her who is born by the life force, the infinite Mother with all the gods in her, her who hath entered in and standeth in the

secret cavern of being with all these creatures. This is the Fire that hath the knowledge and it is hidden in the two tinders as the embryo is borne in pregnant women; this is the Fire that must be adored by men watching sleeplessly and bringing to him the offering. He is that from which the Sun rises and that in which it sets: and in him all the gods are founded and none can pass beyond him. What is here, even that is in other worlds, and what is there, even according to that is all that is here. He goes from death to death who sees here only difference. A Purusha no bigger than a thumb stands in man's central self and is the lord of what was and what shall be, and knowing him thenceforth one shrinks from nothing that is. A Purusha no bigger than a man's thumb and he is like a light without smoke; he is the Lord of what was and what shall be; it is he that is today and it is he that shall be tomorrow.

The Upanishads abound with passages which are at once poetry and spiritual philosophy, of an absolute clarity and beauty, but no translation empty of the suggestions and the grave and subtle and luminous sense echoes of the original words and rhythms can give any idea of their power and perfection. There are others in which the subtlest psychological and philosophical truths are expressed with an entire sufficiency without falling short of a perfect beauty of poetical expression and always so as to live to the mind and soul and not merely be presented to the understanding intelligence. There is in some of the prose Upanishads another element of vivid narrative and tradition which restores for us though only in brief glimpses the picture of that extraordinary stir and movement of spiritual enquiry and passion for the highest knowledge which made the Upanishads possible. The scenes of the old world live before us in a few pages, the sages sitting in their groves ready to test and teach the comer, princes and learned Brahmins and great landed nobles going about in search of knowledge, the king's son in his chariot and the illegitimate son of the servant-girl,

seeking any man who might carry in himself the thought of light and the word of revelation, the typical figures and personalities, Janaka and the subtle mind of Ajatashatru, Raikwa of the cart, Yajnavalkya militant for truth, calm and ironic, taking to himself with both hands without attachment worldly possessions and spiritual riches and casting at last all his wealth behind to wander forth as a houseless ascetic, Krishna son of Devaki who heard a single word of the Rishi Ghora and knew at once the Eternal, the ashramas, the courts of kings who were also spiritual discoverers and thinkers, the great sacrificial assemblies where the sages met and compared their knowledge. And we see how the soul of India was born and how arose this great birth-song in which it soared from its earth into the supreme empyrean of the spirit. The Vedas and the Upanishads are not only the sufficient fountain-head of Indian philosophy and religion, but of all Indian art, poetry and literature. It was the soul, the temperament, the ideal mind formed and expressed in them which later carved out the great philosophies, built the structure of the Dharma, recorded its heroic youth in the Mahabharata and Ramayana, intellectualised indefatigably in the classical times of the ripeness of its manhood, threw out so many original intuitions in science, created so rich a glow of aesthetic and vital and sensuous experience, renewed its spiritual and psychic experience in Tantra and Purana, flung itself into grandeur and beauty of line and colour, hewed and cast its thought and vision in stone and bronze, poured itself into new channels of self-expression in the later tongues and now after eclipse reemerges always the same in difference and ready for a new life and a new creation.

XVIII

Indian Literature – 3

THE VEDA is thus the spiritual and psychological seed of Indian culture and the Upanishads the expression of the truth of highest spiritual knowledge and experience that has always been the supreme idea of that culture and the ultimate objective to which it directed the life of the individual and the aspiration of the soul of the people: and these two great bodies of sacred writing, its first great efforts of poetic and creative self-expression, coming into being at a time preceding the later strong and ample and afterwards rich and curious intellectual development, are conceived and couched in the language of a purely psychic and spiritual mentality. An evolution so begun had to proceed by a sort of enriching descent from the spirit to matter and to pass on first to an intellectual endeavour to see life and the world and the self in all their relations as they present themselves to the reasoning and the practical intelligence. The earlier movement of this intellectual effort was naturally accompanied by a practical development and organisation of life consciously expressive of the mind and spirit of the people, the erection of a strong and successful structure of society shaped so as to fulfil the mundane objects of human existence under the control of a careful religious, ethical and social order and discipline, but also so as to provide for the evolution of the soul of man through these things to a spiritual freedom and perfection. It is this stage of which we get a remarkably ample and effective representation in the immediately succeeding period of Indian literary creation.

This movement of the Indian mind is represented in its more critical effort on one side by a strenuous philosophical thinking crystallised into the great philosophic systems, on the other by an equally insistent endeavour to formulate in a clear body and with a strict cogency an ethical, social and political ideal and

practice in a consistent and organised system of individual and communal life and that endeavour resulted in the authoritative social treatises or Shastras of which the greatest and the most authoritative is the famous Laws of Manu. The work of the philosophers was to systematise and justify to the reasoning intelligence the truths of the self and man and the world already discovered by intuition, revelation and spiritual experience and embodied in the Veda and the Upanishads, and at the same time to indicate and systematise methods of discipline founded upon this knowledge by which man might effectuate the highest aim of his existence. The characteristic form in which this was done shows the action of the intuitive passing into that of the intellectual mentality and preserves the stamp and form expressive of its transitional character. The terse and pregnant phrase of the sacred literature abounding in intuitive substance is replaced by a still more compact and crowded brief expression, no longer intuitive and poetic, but severely intellectual,—the expression of a principle, a whole development of philosophic thought or a logical step burdened with considerable consequences in a few words, sometimes one or two, a shortest decisive formula often almost enigmatic in its concentrated fullness. These Sutras or aphorisms became the basis of ratiocinative commentaries developing by metaphysical and logical method and with a considerable variety of interpretation all that was contained at first in the series of aphoristic formulas. Their concern is solely with original and ultimate truth and the method of spiritual liberation, *mokṣa*.

The work of the social thinkers and legislators was on the contrary concerned with normal action and practice. It attempted to take up the ordinary life of man and of the community and the life of human desire and aim and interest and ordered rule and custom and to interpret and formulate it in the same complete and decisive manner and at the same time to throw the whole into an ordered relation to the ruling ideas of the national culture and frame and perpetuate a social system intelligently fashioned so as to provide a basis, a structure, a gradation by which there could be a secure evolution of the life

from the vital and mental to the spiritual motive. The leading idea was the government of human interest and desire by the social and ethical law, the Dharma, so that it might be made,— all vital, economic, aesthetic, hedonistic, intellectual and other needs being satisfied duly and according to the right law of the nature,— a preparation for the spiritual existence. Here too we have as an initial form the aphoristic method of the Vedic *grhya-sūtras*, afterwards the diffuser, fuller method of the Dharma Shastras,— the first satisfied with brief indications of simple and essential socio-religious principle and practice, the later work attempting to cover the whole life of the individual, the class and the people. The very character of the effort and its thoroughness and the constant unity of idea that reigns through the whole of it are a remarkable evidence of a very developed intellectual, aesthetic and ethical consciousness and a high turn and capacity for a noble and ordered civilisation and culture. The intelligence at work, the understanding and formative power manifested is not inferior to that of any ancient or modern people, and there is a gravity, a unified clarity and nobility of conception which balances at least in any true idea of culture the greater suppleness, more well-informed experience and science and eager flexibility of experimental hardihood which are the gains that distinguish our later humanity. At any rate it was no barbaric mind that was thus intently careful for a fine and well unified order of society, a high and clear thought to govern it and at the end of life a great spiritual perfection and release.

The pure literature of the period is represented by the two great epics, the Mahabharata, which gathered into its vast structure the greater part of the poetic activity of the Indian mind during several centuries, and the Ramayana. These two poems are epical in their motive and spirit, but they are not like any other two epics in the world, but are entirely of their own kind and subtly different from others in their principle. It is not only that although they contain an early heroic story and a transmutation of many primitive elements, their form belongs to a period of highly developed intellectual, ethical and social culture, is enriched with a body of mature thought and uplifted

by a ripe nobility and refined gravity of ethical tone and therefore these poems are quite different from primitive edda and saga and greater in breadth of view and substance and height of motive — I do not speak now of aesthetic quality and poetic perfection — than the Homeric poems, while at the same time there is still an early breath, a direct and straightforward vigour, a freshness and greatness and pulse of life, a simplicity of strength and beauty that makes of them quite another kind than the elaborately constructed literary epics of Virgil or Milton, Firdausi or Kalidasa. This peculiar blending of the natural breath of an early, heroic, swift and vigorous force of life with a strong development and activity of the ethical, the intellectual, even the philosophic mind is indeed a remarkable feature; these poems are the voice of the youth of a people, but a youth not only fresh and fine and buoyant, but also great and accomplished, wise and noble. This however is only a temperamental distinction: there is another that is more far-reaching, a difference in the whole conception, function and structure.

One of the elements of the old Vedic education was a knowledge of significant tradition, Itihasa, and it is this word that was used by the ancient critics to distinguish the Mahabharata and the Ramayana from the later literary epics. The Itihasa was an ancient historical or legendary tradition turned to creative use as a significant mythus or tale expressive of some spiritual or religious or ethical or ideal meaning and thus formative of the mind of the people. The Mahabharata and Ramayana are Itihasas of this kind on a large scale and with a massive purpose. The poets who wrote and those who added to these great bodies of poetic writing did not intend merely to tell an ancient tale in a beautiful or noble manner or even to fashion a poem pregnant with much richness of interest and meaning, though they did both these things with a high success; they wrote with a sense of their function as architects and sculptors of life, creative exponents, fashioners of significant forms of the national thought and religion and ethics and culture. A profound stress of thought on life, a large and vital view of religion and society, a certain strain of philosophic idea runs through these poems

and the whole ancient culture of India is embodied in them with a great force of intellectual conception and living presentation. The Mahabharata has been spoken of as a fifth Veda, it has been said of both these poems that they are not only great poems but Dharmashastras, the body of a large religious and ethical and social and political teaching, and their effect and hold on the mind and life of the people have been so great that they have been described as the bible of the Indian people. That is not quite an accurate analogy, for the bible of the Indian people contains also the Veda and Upanishads, the Purana and Tantras and the Dharmashastras, not to speak of a large bulk of the religious poetry in the regional languages. The work of these epics was to popularise high philosophic and ethical idea and cultural practice; it was to throw out prominently and with a seizing relief and effect in a frame of great poetry and on a background of poetic story and around significant personalities that became to the people abiding national memories and representative figures all that was best in the soul and thought or true to the life or real to the creative imagination and ideal mind or characteristic and illuminative of the social, ethical, political and religious culture of India. All these things were brought together and disposed with artistic power and a telling effect in a poetic body given to traditions half legendary, half historic but cherished henceforth as deepest and most living truth and as a part of their religion by the people. Thus framed the Mahabharata and Ramayana, whether in the original Sanskrit or rewritten in the regional tongues, brought to the masses by Kathakas,— rhapsodists, reciters and exegetes,— became and remained one of the chief instruments of popular education and culture, moulded the thought, character, aesthetic and religious mind of the people and gave even to the illiterate some sufficient tincture of philosophy, ethics, social and political ideas, aesthetic emotion, poetry, fiction and romance. That which was for the cultured classes contained in Veda and Upanishad, shut into profound philosophical aphorism and treatise or inculcated in dharma-shastra and artha-shastra, was put here into creative and living figures, associated with familiar story and legend,

fused into a vivid representation of life and thus made a near and living power that all could readily assimilate through the poetic word appealing at once to the soul and the imagination and the intelligence.

The Mahabharata especially is not only the story of the Bharatas, the epic of an early event which had become a national tradition but on a vast scale the epic of the soul and religious and ethical mind and social and political ideals and culture and life of India. It is said popularly of it and with a certain measure of truth that whatever is in India is in the Mahabharata. The Mahabharata is the creation and expression not of a single individual mind, but of the mind of a nation; it is the poem of itself written by a whole people. It would be vain to apply to it the canons of a poetical art applicable to an epic poem with a smaller and more restricted purpose, but still a great and quite conscious art has been expended both on its detail and its total structure. The whole poem has been built like a vast national temple unrolling slowly its immense and complex idea from chamber to chamber, crowded with significant groups and sculptures and inscriptions, the grouped figures carved in divine or semi-divine proportions, a humanity aggrandised and half uplifted to superhumanity and yet always true to the human motive and idea and feeling, the strain of the real constantly raised by the tones of the ideal, the life of this world amply portrayed but subjected to the conscious influence and presence of the powers of the worlds behind it, and the whole unified by the long embodied procession of a consistent idea worked out in the wide steps of the poetic story. As is needed in an epic narrative, the conduct of the story is the main interest of the poem and it is carried through with an at once large and minute movement, wide and bold in the mass, striking and effective in detail, always simple, strong and epic in its style and pace. At the same time though supremely interesting in substance and vivid in the manner of the telling as a poetic story, it is something more, — a significant tale, *Itihasa*, representative throughout of the central ideas and ideals of Indian life and culture. The leading motive is the Indian idea of the Dharma. Here the Vedic notion of the struggle between the

godheads of truth and light and unity and the powers of darkness and division and falsehood is brought out from the spiritual and religious and internal into the outer intellectual, ethical and vital plane. It takes there in the figure of the story a double form of a personal and a political struggle, the personal a conflict between typical and representative personalities embodying the greater ethical ideals of the Indian Dharma and others who are embodiments of Asuric egoism and self-will and misuse of the Dharma, the political a battle in which the personal struggle culminates, an international clash ending in the establishment of a new rule of righteousness and justice, a kingdom or rather an empire of the Dharma uniting warring races and substituting for the ambitious arrogance of kings and aristocratic clans the supremacy, the calm and peace of a just and humane empire. It is the old struggle of Deva and Asura, God and Titan, but represented in the terms of human life.

The way in which this double form is worked out and the presentation of the movement of individual lives and of the national life first as their background and then as coming into the front in a movement of kingdoms and armies and nations show a high architectonic faculty akin in the sphere of poetry to that which laboured in Indian architecture, and the whole has been conducted with a large poetic art and vision. There is the same power to embrace great spaces in a total view and the same tendency to fill them with an abundance of minute, effective, vivid and significant detail. There is brought too into the frame of the narrative a very considerable element of other tales, legends, episodes, most of them of a significant character suitable to the method of Itihasa, and an extraordinary amount of philosophical, religious, ethical, social and political thinking sometimes direct, sometimes cast into the form of the legend and episode. The ideas of the Upanishads and of the great philosophies are brought in continually and sometimes given new developments, as in the Gita; religious myth and tale and idea and teaching are made part of the tissue; the ethical ideals of the race are expressed or are transmuted into the shape of tale and episode as well as embodied in the figures of the story,

political and social ideals and institutions are similarly developed or illustrated with a high vividness and clearness and space is found too for aesthetic and other suggestions connected with the life of the people. All these things are interwoven into the epic narrative with a remarkable skill and closeness. The irregularities inevitable in so combined and difficult a plan and in a work to which many poets of an unequal power have contributed fall into their place in the general massive complexity of the scheme and assist rather than break the total impression. The whole is a poetic expression unique in its power and fullness of the entire soul and thought and life of a people.

The Ramayana is a work of the same essential kind as the Mahabharata; it differs only by a greater simplicity of plan, a more delicate ideal temperament and a finer glow of poetic warmth and colour. The main bulk of the poem in spite of much accretion is evidently by a single hand and has a less complex and more obvious unity of structure. There is less of the philosophic, more of the purely poetic mind, more of the artist, less of the builder. The whole story is from beginning to end of one piece and there is no deviation from the stream of the narrative. At the same time there is a like vastness of vision, an even more wide-winged flight of epic sublimity in the conception and sustained richness of minute execution in the detail. The structural power, strong workmanship and method of disposition of the Mahabharata remind one of the art of the Indian builders, the grandeur and boldness of outline and wealth of colour and minute decorative execution of the Ramayana suggest rather a transcript into literature of the spirit and style of Indian painting. The epic poet has taken here also as his subject an Itihasa, an ancient tale or legend associated with an old Indian dynasty and filled it in with detail from myth and folklore, but has exalted all into a scale of grandiose epic figure that it may bear more worthily the high intention and significance. The subject is the same as in the Mahabharata, the strife of the divine with the titanic forces in the life of the earth, but in more purely ideal forms, in frankly supernatural dimensions and an imaginative heightening of both the good and the evil in human

character. On one side is portrayed an ideal manhood, a divine beauty of virtue and ethical order, a civilization founded on the Dharma and realising an exaltation of the moral ideal which is presented with a singularly strong appeal of aesthetic grace and harmony and sweetness; on the other are wild and anarchic and almost amorphous forces of superhuman egoism and self-will and exultant violence, and the two ideas and powers of mental nature living and embodied are brought into conflict and led to a decisive issue of the victory of the divine man over the Rakshasa. All shade and complexity are omitted which would diminish the single purity of the idea, the representative force in the outline of the figures, the significance of the temperamental colour and only so much admitted as is sufficient to humanise the appeal and the significance. The poet makes us conscious of the immense forces that are behind our life and sets his action in a magnificent epic scenery, the great imperial city, the mountains and the ocean, the forest and wilderness, described with such a largeness as to make us feel as if the whole world were the scene of his poem and its subject the whole divine and titanic possibility of man imaged in a few great or monstrous figures. The ethical and the aesthetic mind of India have here fused themselves into a harmonious unity and reached an unexampled pure wideness and beauty of self-expression. The Ramayana embodied for the Indian imagination its highest and tenderest human ideals of character, made strength and courage and gentleness and purity and fidelity and self-sacrifice familiar to it in the suavest and most harmonious forms coloured so as to attract the emotion and the aesthetic sense, stripped morals of all repellent austerity on one side or on the other of mere commonness and lent a certain high divineness to the ordinary things of life, conjugal and filial and maternal and fraternal feeling, the duty of the prince and leader and the loyalty of follower and subject, the greatness of the great and the truth and worth of the simple, toning things ethical to the beauty of a more psychical meaning by the glow of its ideal hues. The work of Valmiki has been an agent of almost incalculable power in the moulding of the cultural mind of India: it has presented to it to be loved and imitated in figures

like Rama and Sita, made so divinely and with such a revelation of reality as to become objects of enduring cult and worship, or like Hanuman, Lakshmana, Bharata the living human image of its ethical ideals; it has fashioned much of what is best and sweetest in the national character, and it has evoked and fixed in it those finer and exquisite yet firm soul tones and that more delicate humanity of temperament which are a more valuable thing than the formal outsides of virtue and conduct.

The poetical manner of these epics is not inferior to the greatness of their substance. The style and the verse in which they are written have always a noble epic quality, a lucid classical simplicity and directness rich in expression but stripped of superfluous ornament, a swift, vigorous, flexible and fluid verse constantly sure of the epic cadence. There is a difference in the temperament of the language. The characteristic diction of the Mahabharata is almost austere masculine, trusting to force of sense and inspired accuracy of turn, almost ascetic in its simplicity and directness and a frequent fine and happy barenness; it is the speech of a strong and rapid poetical intelligence and a great and straightforward vital force, brief and telling in phrase but by virtue of a single-minded sincerity and, except in some knotted passages or episodes, without any rhetorical labour of compactness, a style like the light and strong body of a runner nude and pure and healthily lustrous and clear without superfluity of flesh or exaggeration of muscle, agile and swift and untired in the race. There is inevitably much in this vast poem that is in an inferior manner, but little or nothing that falls below a certain sustained level in which there is always something of this virtue. The diction of the Ramayana is shaped in a more attractive mould, a marvel of sweetness and strength, lucidity and warmth and grace; its phrase has not only poetic truth and epic force and diction but a constant intimate vibration of the feeling of the idea, emotion or object: there is an element of fine ideal delicacy in its sustained strength and breath of power. In both poems it is a high poetic soul and inspired intelligence that is at work; the directly intuitive mind of the Veda and Upanishads has

retired behind the veil of the intellectual and outwardly psychical imagination.

This is the character of the epics and the qualities which have made them immortal, cherished among India's greatest literary and cultural treasures, and given them their enduring power over the national mind. Apart from minor defects and inequalities such as we find in all works set at this pitch and involving a considerable length of labour, the objections made by Western criticism are simply expressions of a difference of mentality and aesthetic taste. The vastness of the plan and the leisurely minuteness of detail are baffling and tiring to a Western mind accustomed to smaller limits, a more easily fatigued eye and imagination and a hastier pace of life, but they are congenial to the spaciousness of vision and intent curiosity of circumstance, characteristic of the Indian mind, that spring as I have pointed out in relation to architecture from the habit of the cosmic consciousness and its sight and imagination and activity of experience. Another difference is that the terrestrial life is not seen realistically just as it is to the physical mind but constantly in relation to the much that is behind it, the human action is surrounded and influenced by great powers and forces, Daivic, Asuric and Rakshasic, and the greater human figures are a kind of incarnation of these more cosmic personalities and powers. The objection that the individual thereby loses his individual interest and becomes a puppet of impersonal forces is not true either in reality or actually in the imaginative figures of this literature, for there we see that the personages gain by it in greatness and force of action and are only ennobled by an impersonality that raises and heightens the play of their personality. The mingling of terrestrial nature and supernature, not as a mere imagination but with an entire sincerity and naturalness, is due to the same conception of a greater reality in life, and it is as significant figures of this greater reality that we must regard much to which the realistic critic objects with an absurdly misplaced violence, such as the powers gained by Tapasya, the use of divine weapons, the frequent indications of psychic action and influence. The complaint of exaggeration is equally invalid

where the whole action is that of men raised beyond the usual human level, since we can only ask for proportions consonant with the truth of the stature of life conceived in the imagination of the poet and cannot insist on an unimaginative fidelity to the ordinary measures which would here be false because wholly out of place. The complaint of lifelessness and want of personality in the epic characters is equally unfounded: Rama and Sita, Arjuna and Yudhisthira, Bhishma and Duryodhana and Karna are intensely real and human and alive to the Indian mind. Only the main insistence, here as in Indian art, is not on the outward saliences of character, for these are only used secondarily as aids to the presentation, but on the soul life and the inner soul quality presented with as absolute a vividness and strength and purity of outline as possible. The idealism of characters like Rama and Sita is no pale and vapid unreality; they are vivid with the truth of the ideal life, of the greatness that man may be and does become when he gives his soul a chance and it is no sound objection that there is only a small allowance of the broken littleness of our ordinary nature.

These epics are therefore not a mere mass of untransmuted legend and folklore, as is ignorantly objected, but a highly artistic representation of intimate significances of life, the living presentment of a strong and noble thinking, a developed ethical and aesthetic mind and a high social and political ideal, the ensouled image of a great culture. As rich in freshness of life but immeasurably more profound and evolved in thought and substance than the Greek, as advanced in maturity of culture but more vigorous and vital and young in strength than the Latin epic poetry, the Indian epic poems were fashioned to serve a greater and completer national and cultural function and that they should have been received and absorbed by both the high and the low, the cultured and the masses and remained through twenty centuries an intimate and formative part of the life of the whole nation is of itself the strongest possible evidence of the greatness and fineness of this ancient Indian culture.

XIX

Indian Literature – 4

THE CLASSICAL age of the ancient literature, the best known and appraised of all, covers a period of some ten centuries and possibly more, and it is marked off from the earlier writings by a considerable difference, not so much in substance, as in the moulding and the colour of its thought, temperament and language. The divine childhood, the heroic youth, the bright and strong early manhood of the people and its culture are over and there is instead a long and opulent maturity and as its sequence an equally opulent and richly coloured decline. The decline is not to death, for it is followed by a certain rejuvenescence, a fresh start and repeated beginning, of which the medium is no longer Sanskrit but the derived languages, the daughters of the dialects raised into literary instruments and developing as the grand and ancient tongue loses its last forces and inspiring life. The difference in spirit and mould between the epics and the speech of Bhartrihari and Kalidasa is already enormous and may possibly be explained by the early centuries of Buddhism when Sanskrit ceased to be the sole literary tongue understood and spoken by all educated men and Pali came up as its successful rival and the means of expression for at least a great part of the current of the national thought and life. The language and movement of the epics have all the vigour, freedom, spontaneous force and appeal of a speech that leaps straight from the founts of life; the speech of Kalidasa is an accomplished art, an intellectual and aesthetic creation consummate, deliberate, finely ornate, carved like a statue, coloured like a painting, not yet artificial, though there is a masterly artifice and device, but still a careful work of art laboured by the intelligence. It is carefully natural, not with the spontaneous ease of a first, but the accomplished air of ease of a habitual second nature. The elements of artifice and device increase and

predominate in the later writers, their language is a laborious and deliberate though a powerful and beautiful construction and appeals only to an erudite audience, a learned elite. The religious writings, Purana and Tantra, moving from a deeper, still intensely living source, aiming by their simplicity at a wider appeal, prolong for a time the tradition of the epics, but the simplicity and directness is willed rather than the earlier natural ease. In the end Sanskrit becomes the language of the Pundits and except for certain philosophical, religious and learned purposes no longer a first-hand expression of the life and mind of the people.

The alteration in the literary speech corresponds however, apart from all inducing circumstances, to a great change in the centre of mentality of the culture. It is still and always spiritual, philosophical, religious, ethical, but the inner austerer things seem to draw back a little and to stand in the background, acknowledged indeed and overshadowing the rest, but nevertheless a little detaching themselves from them and allowing them to act for their own enlargement and profit. The exterior powers that stand out in front are the curious intellect, the vital urge, the aesthetic, urbanely active and hedonistic sense life. It is the great period of logical philosophy, of science, of art and the developed crafts, law, politics, trade, colonisation, the great kingdoms and empires with their ordered and elaborate administrations, the minute rule of the Shastras in all departments of thought and life, an enjoyment of all that is brilliant, sensuous, agreeable, a discussion of all that could be thought and known, a fixing and systemising of all that could be brought into the compass of intelligence and practice,—the most splendid, sumptuous and imposing millennium of Indian culture.

The intellectuality that predominates is not in any way restless, sceptical or negative, but it is enormously inquiring and active, accepting the great lines of spiritual, religious, philosophical and social truth that had been discovered and laid down by the past, but eager too to develop, to complete, to know minutely and thoroughly and fix in perfectly established system and detail, to work out all possible branches and ramifications,

to fill the intelligence, the sense and the life. The grand basic principles and lines of Indian religion, philosophy, society have already been found and built and the steps of the culture move now in the magnitude and satisfying security of a great tradition; but there is still ample room for creation and discovery within these fields and a much wider province, great beginnings, strong developments of science and art and literature, the freedom of the purely intellectual and aesthetic activities, much scope too for the hedonisms of the vital and the refinements of the emotional being, a cultivation of the art and rhythmic practice of life. There is a highly intellectualised vital stress and a many-sided interest in living, an indulgence of an at once intellectual and vital and sensuous satisfaction extending even to a frankness of physical and sensual experience, but in the manner of the oriental mind with a certain decorousness and order, an element of aesthetic restraint and the observance of rule and measure even in indulgence that saves always from the unbridled licence to which less disciplined races are liable. The characteristic, the central action is the play of the intellectual mind and everywhere that predominates. In the earlier age the many strands of the Indian mind and life principle are unified and inseparable, a single wide movement set to a strong and abundant but simple music; here they seem to stand side by side related and harmonised, curious and complex, multiply one. The spontaneous unity of the intuitive mind is replaced by the artificial unity of the analysing and synthetising intelligence. Art and religion still continue the predominance of the spiritual and intuitive motive, but it is less to the front in literature. A division has been settled between religious and secular writing that did not exist to any appreciable extent in the previous ages. The great poets and writers are secular creators and their works have no chance of forming part of the intimate religious and ethical mind of the people as did the Ramayana and Mahabharata. The stream of religious poetry flows separately in Purana and Tantra.

The great representative poet of this age is Kalidasa. He establishes a type which was preparing before and endured after him with more or less of additional decoration, but substantially

unchanged through the centuries. His poems are the perfect and harmoniously designed model of a kind and substance that others cast always into similar forms but with a genius inferior in power or less rhythmically balanced, faultless and whole. The art of poetic speech in Kalidasa's period reaches an extraordinary perfection. Poetry itself had become a high craft, conscious of its means, meticulously conscientious in the use of its instruments, as alert and exact in its technique as architecture, painting and sculpture, vigilant to equate beauty and power of the form with nobility and richness of the conception, aim and spirit and the scrupulous completeness of its execution with fullness of aesthetic vision or of the emotional or sensuous appeal. There was established here as in the other arts and indeed during all this era in all human activities a Shastra, a well recognised and carefully practised science and art of poetics, critical and formulative of all that makes perfection of method and prescriptive of things to be avoided, curious of essentials and possibilities but under a regime of standards and limits conceived with the aim of excluding all fault of excess or of defect and therefore in practice as unfavourable to any creative lawlessness, even though the poet's native right of fantasy and freedom is theoretically admitted, as to any least tendency towards bad or careless, hasty or irregular workmanship. The poet is expected to be thoroughly conscious of his art, as minutely acquainted with its conditions and its fixed and certain standard and method as the painter and sculptor and to govern by his critical sense and knowledge the flight of his genius. This careful art of poetry became in the end too much of a rigid tradition, too appreciative of rhetorical device and artifice and even permitted and admired the most extraordinary contortions of the learned intelligence, as in the Alexandrian decline of Greek poetry, but the earlier work is usually free from these shortcomings or they are only occasional and rare.

The classical Sanskrit is perhaps the most remarkably finished and capable instrument of thought yet fashioned, at any rate by either the Aryan or the Semitic mind, lucid with the utmost possible clarity, precise to the farthest limit of precision, always compact and at its best sparing in its formation of phrase,

but yet with all this never poor or bare: there is no sacrifice of depth to lucidity, but rather a pregnant opulence of meaning, a capacity of high richness and beauty, a natural grandeur of sound and diction inherited from the ancient days. The abuse of the faculty of compound structure proved fatal later on to the prose, but in the earlier prose and poetry where it is limited, there is an air of continent abundance strengthened by restraint and all the more capable of making the most of its resources. The great and subtle and musical rhythms of the classical poetry with their imaginative, attractive and beautiful names, manifold in capacity, careful in structure, are of themselves a mould that insists on perfection and hardly admits the possibility of a mean or slovenly workmanship or a defective movement. The unit of this poetical art is the *śloka*, the sufficient verse of four quarters or *pādas*, and each *śloka* is expected to be a work of perfect art in itself, a harmonious, vivid and convincing expression of an object, scene, detail, thought, sentiment, state of mind or emotion that can stand by itself as an independent figure; the succession of *ślokas* must be a constant development by addition of completeness to completeness and the whole poem or canto of a long poem an artistic and satisfying structure in this manner, the succession of cantos a progression of definite movements building a total harmony. It is this carefully artistic and highly cultured type of poetic creation that reached its acme of perfection in the poetry of Kalidasa.

This preeminence proceeds from two qualities possessed in a degree only to be paralleled in the work of the greatest world-poets and not always combined in them in so equable a harmony and with so adequate a combination of execution and substance. Kalidasa ranks among the supreme poetic artists with Milton and Virgil and he has a more subtle and delicate spirit and touch in his art than the English, a greater breath of native power informing and vivifying his execution than the Latin poet. There is no more perfect and harmonious style in literature, no more inspired and careful master of the absolutely harmonious and sufficient phrase combining the minimum of word expenditure with the fullest sense of an accomplished ease

and a divine elegance and not excluding a fine excess that is not excessive, an utmost possible refined opulence of aesthetic value. More perfectly than any other he realises the artistic combination of a harmonious economy of expression, not a word, syllable, sound in superfluity, and a total sense of wise and lavish opulence that was the aim of the earlier classical poets. None so divinely skilful as he in imparting without any overdoing the richest colour, charm, appeal and value, greatness or nobility or power or suavity and always some kind and the right kind and the fullest degree of beauty to each line and each phrase. The felicity of selection is equalled by the felicity of combination. One of the most splendidly sensuous of poets in the higher sense of that epithet because he has a vivid vision and feeling of his object, his sensuousness is neither lax nor overpowering, but always satisfying and just, because it is united with a plenary force of the intelligence, a gravity and strength sometimes apparent, sometimes disguised in beauty but appreciable within the broidered and coloured robe, a royal restraint in the heart of the regal indulgence. And Kalidasa's sovereign mastery of rhythm is as great as his sovereign mastery of phrase. Here we meet in each metrical kind with the most perfect discoveries of verbal harmony in the Sanskrit language (pure lyrical melody comes only afterwards at the end in one or two poets like Jayadeva), harmonies founded on a constant subtle complexity of the fine assonances of sound and an unobtrusive use of significant cadence that never breaks the fluent unity of tone of the music. And the other quality of Kalidasa's poetry is the unfailing adequacy of the substance. Careful always to get the full aesthetic value of the word and sound clothing his thought and substance, he is equally careful that the thought and the substance itself should be of a high, strong or rich intellectual, descriptive or emotional value. His conception is large in its view though it has not the cosmic breadth of the earlier poets and it is sustained at every step in its execution. The hand of the artist never fails in the management of its material,—exception being made of a fault of composition marring one, the least considerable of his works,— and his

imagination is always as equal to its task as his touch is great and subtle.

The work to which these supreme poetic qualities were brought was very much the same at bottom, though differing in its form and method, as that achieved by the earlier epics; it was to interpret in poetic speech and represent in significant images and figures the mind, the life, the culture of India in his age. Kalidasa's seven extant poems, each in its own way and within its limits and on its level a masterpiece, are a brilliant and delicately ornate roll of pictures and inscriptions with that as their single real subject. His was a richly stored mind, the mind at once of a scholar and observer possessed of all the learning of his time, versed in the politics, law, social idea, system and detail, religion, mythology, philosophy, art of his time, intimate with the life of courts and familiar with the life of the people, widely and very minutely observant of the life of Nature, of bird and beast, season and tree and flower, all the lore of the mind and all the lore of the eye; and this mind was at the same time always that of a great poet and artist. There is not in his work the touch of pedantry or excessive learning that mars the art of some other Sanskrit poets, he knows how to subdue all his matter to the spirit of his art and to make the scholar and observer no more than a gatherer of materials for the poet, but the richness of documentation is there ready and available and constantly brought in as part of incident and description and surrounding idea and forms or intervenes in the brilliant series of images that pass before us in the long succession of magnificent couplets and stanzas. India, her great mountains and forests and plains and their peoples, her men and women and the circumstances of their life, her animals, her cities and villages, her hermitages, rivers, gardens and tilled lands are the background of narrative and drama and love poem. He has seen it all and filled his mind with it and never fails to bring it before us vivid with all the wealth of description of which he is capable. Her ethical and domestic ideals, the life of the ascetic in the forest or engaged in meditation and austerity upon the mountains and the life of the householder, her familiar customs and social standards and

observances, her religious notions, cult, symbols give the rest of the surroundings and the atmosphere. The high actions of gods and kings, the nobler or the more delicate human sentiments, the charm and beauty of women, the sensuous passion of lovers, the procession of the seasons and the scenes of Nature, these are his favourite subjects.

He is a true son of his age in his dwelling on the artistic, hedonistic, sensuous sides of experience and preeminently a poet of love and beauty and the joy of life. He represents it also in his intellectual passion for higher things, his intense appreciation of knowledge, culture, the religious idea, the ethical ideal, the greatness of ascetic self-mastery, and these too he makes a part of the beauty and interest of life and sees as admirable elements of its complete and splendid picture. All his work is of this tissue. His great literary epic, the "House of Raghu", treats the story of a line of ancient kings as representative of the highest religious and ethical culture and ideals of the race and brings out its significances environed with a splendid decoration of almost pictorially depicted sentiment and action, noble or beautiful thought and speech and vivid incident and scene and surrounding. Another unfinished epic, a great fragment but by the virtue of his method of work complete in itself so far as the tale proceeds, is in subject a legend of the gods, the ancient subject of a strife of Gods and Titans, the solution prepared here by a union of the supreme God and the Goddess, but in treatment it is a description of Nature and the human life of India raised to a divine magnitude on the sacred mountain and in the homes of the high deities. His three dramas move around the passion of love, but with the same insistence on the detail and picture of life. One poem unrolls the hued series of the seasons of the Indian year. Another leads the messenger cloud across northern India viewing as it passes the panorama of her scenes and closes on a vivid and delicately sensuous and emotional portrayal of the passion of love. In these varied settings we get a singularly complete impression of the mind, the tradition, the sentiment, the rich, beautiful and ordered life of the India of the times, not in its very deepest things, for these have to be sought elsewhere,

but in what was for the time most characteristic, the intellectual, vital and artistic turn of that period of her culture.

The rest of the poetry of the times is of one fundamental type with Kalidasa's; for it has with individual variations the same thought mind, temperament, general materials, poetic method, and much of it has a high genius or an unusual quality and distinction though not the same perfection, beauty and felicity. The literary epics of Bharavi and Magha reveal the beginning of the decline marked by the progressive encroachment of a rhetorical and laborious standard of form, method and manner that heavily burdens and is bound eventually to stifle the poetic spirit, an increasing artificiality of tradition and convention and gross faults of taste that bear evidence of the approaching transmission of the language out of the hands of the literary creator into the control of the Pundit and pedant. Magha's poem is more constructed by rule of rhetoric than created and he displays as merits the very worst puerilities of melodious jingle, intricate acrostic and laborious double meaning. Bharavi is less attainted by the decadence, but not immune, and he suffers himself to be betrayed by its influence to much that is neither suitable to his temperament and genius nor in itself beautiful or true. Nevertheless Bharavi has high qualities of grave poetic thinking and epic sublimity of description and Magha poetic gifts that would have secured for him a more considerable place in literature if the poet had not been crossed with a pedant. In this mixture of genius with defect of taste and manner the later classical poets resemble the Elizabethans with the difference that in one case the incoherence is the result of a crude and still unripe, in the other of an overripe and decadent culture. At the same time they bring out very prominently the character of this age of Sanskrit literature, its qualities but also its limitations that escape the eye in Kalidasa and are hidden in the splendour of his genius.

This poetry is preeminently a ripe and deliberate poetic representation and criticism of thought and life and the things that traditionally interested an aristocratic and cultured class in a very advanced and intellectual period of civilisation. The intellect predominates everywhere and, even when it seems to

stand aside and leave room for pure objective presentation, it puts on that too the stamp of its image. In the earlier epics the thought, religion, ethics, life movements are all strongly lived; the poetic intelligence is at work but always absorbed in its work, self-forgetful and identified with its object, and it is this that is the secret of their great creative force and living poetic sincerity and power. The later poets are interested in the same things but with an intensely reflective experience and critical intelligence that always observes more than it lives with its objects. In the literary epics there is no real movement of life, but only a close brilliant description of life. The poet makes to pass before us a series of pictured incidents, scenes, details, figures, attitudes richly coloured, exact, vivid, convincing to the eye and attractive, but in spite of the charm and interest we speedily perceive that these are only animated pictures. Things are indeed seen vividly but with the more outer eye of the imagination, observed by the intellect, reproduced by the sensuous imagination of the poet, but they have not been deeply lived in the spirit. Kalidasa alone is immune from this deficiency of the method because there is in him a great thinking, imaginative, sensuous poetic soul that has lived and creates what he pictures and does not merely fabricate brilliant scenes and figures. The rest only occasionally rise above the deficiency and do then great and not only brilliant or effective work. Their ordinary work is so well done as to deserve great and unstinted praise for what it possesses, but not the highest praise. It is in the end more decorative than creative. There ensues from the character of this poetic method a spiritual consequence, that we see here very vividly the current thought, ethics, aesthetic culture, active and sense life of contemporary India, but not the deeper soul of these things so much as their outer character and body. There is much ethical and religious thought of a sufficiently high ideal kind, and it is quite sincere but only intellectually sincere, and therefore there is no impression of the deeper religious feeling or the living ethical power that we get in the Mahabharata and Ramayana and in most of the art and literature of India. The ascetic life is depicted, but only in its ideas and outward figure:

the sensuous life is depicted in the same scrupulous manner — it is intensely observed and appreciated and well reproduced to the eye and the intelligence, but not intensely felt and created in the soul of the poet. The intellect has become too detached and too critically observant to live things with the natural force of the life or with the intuitive identity. This is the quality and also the malady of an overdeveloped intellectualism and it has always been the forerunner of a decadence.

The predominantly intellectual turn appears in the abundance of another kind of writing, the gnomic verse, *subhāṣita*. This is the use of the independent completeness of the *śloka* to be the body in its single sufficiency of the concentrated essence and expression of a thought, an aperçu or significant incident of life, a sentiment so expressed as to convey its essential idea to the intelligence. There is a great plenty of this kind of work admirably done; for it was congenial to the keen intellect and the wide, mature and well-stored experience of the age: but in the work of Bhartrihari it assumes the proportions of genius, because he writes not only with the thought but with emotion, with what might be called a moved intellectuality of the feeling and an intimate experience that gives great potency and sometimes poignancy to his utterance. There are three centuries or *śatakas* of his sentences, the first expressing high ethical thought or worldly wisdom or brief criticisms of aspects of life, the second concerned with erotic passion, much less effective because it is the fruit of curiosity and the environment rather than the poet's own temperament and genius, and the third proclaiming an ascetic weariness and recoil from the world. Bhartrihari's triple work is significant of the three leading motives of the mind of the age, its reflective interest in life and turn for high and strong and minute thinking, its preoccupation with the enjoyment of the senses, and its ascetic spiritual turn — the end of the one and the ransom of the other. It is significant too by the character of this spirituality; it is no longer the great natural flight of the spirit to the fullness of its own high domain, but rather a turning away of the intellect and the senses wearied of themselves and life, unable to find there the

satisfaction they sought, to find peace in a spiritual passivity in which the tired thought and sense could find their absolute rest and cessation.

The drama however is the most attractive though not therefore the greatest product of the poetical mind of the age. There its excessive intellectuality was compelled by the necessities of dramatic poetry to be more closely and creatively identified with the very mould and movement of life. The Sanskrit drama type is a beautiful form and it has been used in most of the plays that have come down to us with an accomplished art and a true creative faculty. At the same time it is true that it does not rise to the greatnesses of the Greek or the Shakespearian drama. This is not due to the elimination of tragedy,—for there can be dramatic creation of the greatest kind without a solution in death, sorrow, overwhelming calamity or the tragic return of Karma, a note that is yet not altogether absent from the Indian mind,—for it is there in the Mahabharata and was added later on to the earlier triumphant and victorious close of the Ramayana; but a closing air of peace and calm was more congenial to the sattwic turn of the Indian temperament and imagination. It is due to the absence of any bold dramatic treatment of the great issues and problems of life. These dramas are mostly romantic plays reproducing the images and settled paces of the most cultured life of the time cast into the frame of old myth and legend, but a few are more realistic and represent the type of the citizen householder or other scenes of the times or a historical subject. The magnificent courts of kings or the beauty of the surroundings of Nature are their more common scene. But whatever their subject or kind, they are only brilliant transcripts or imaginative transmutations of life, and something more is needed for the very greatest or most moving dramatic creation. But their type still admits of a high or a strong or delicate poetry and a representation, if not any very profound interpretation of human action and motive and they do not fall short in this kind. A great charm of poetic beauty and subtle feeling and atmosphere,—reaching its most accomplished type in the *Shakuntala* of Kalidasa, the most perfect and captivating romantic drama in

all literature,— or an interesting turn of sentiment and action, a skilful unobtrusive development according to the recognised principle and carefully observed formula of the art, in temperate measure without violent noise of incident or emphatic stress on situation or crowded figures, the movement subdued to a key of suavity and calm, a delicate psychology, not a strongly marked characterisation such as is commonly demanded in the dramatic art of Europe, but a subtle indication by slight touches in the dialogue and action, these are the usual characteristics. It is an art that was produced by and appealed to a highly cultured class, refined, and intellectual and subtle, loving best a tranquil aesthetic charm, suavity and beauty, and it has the limitations of the kind but also its qualities. There is a constant grace and fineness of work in the best period, a plainer and more direct but still fine vigour in Bhasa and the writers who prolong him, a breath of largeness and power in the dramas of Bhavabhuti, a high and consummate beauty in the perfection of Kalidasa.

This drama, this poetry, the prose romances crowded with descriptive detail, monographs like Bana's biography of Harsha or Jonaraja's history of Cashmere, the collections of religious or romantic or realistic tales, the Jatakas, the Kathasaritsagara with its opulence and inexhaustible abundance of narrative in verse, the Panchatantra and the more concise Hitopadesha which develop the form of the animal fable to make a piquant setting for a mass of acute worldly wisdom and policy and statecraft, and a great body of other less known work are only the surviving remnants of what, as many indications show, must have been an immense literary activity, but they are sufficiently abundant and representative to create a crowded and splendid impression, a many-toned picture of a high culture, a rich intellectuality, a great and ordered society with an opulent religious, aesthetic, ethical, economic, political and vital activity, a many-sided development, a plentiful life-movement. As completely as the earlier epics they belie the legend of an India lost in metaphysics and religious dreamings and incapable of the great things of life. The other element which has given rise to this conception, an intense strain of philosophic thinking and religious experience, follows

in fact at this time an almost separate movement and develops gradually behind the pomp and motion of this outward action the thought, the influences, the temperament and tendencies that were to govern another millennium of the life of the Indian people.

Indian Literature – 5

THE DOMINANT note in the Indian mind, the temperament that has been at the foundation of all its culture and originated and supported the greater part of its creative action in philosophy, religion, art and life has been, I have insisted, spiritual, intuitive and psychic: but this fundamental tendency has not excluded but rather powerfully supported a strong and rich intellectual, practical and vital activity. In the secular classical literature this activity comes very much to the front, is the prominent characteristic and puts the original spirit a little in the background. That does not mean that the spirit is changed or lost or that there is nothing psychic or intuitive in the secular poetry of the time. On the contrary all the type of the mind reflected there is of the familiar Indian character constant through every change, religio-philosophic, religio-ethical, religio-social, with all the past spiritual experience behind it and supporting it though not prominently in the front; the imagination is of the same kind that we have found in the art of the time; the frames of significant image, symbol and myth are those which have come down from the past subjected to the modifications and new developments that get their full body in the Puranas, and they have a strong psychic suggestion. The difference is that they take in the hands of these poets more of the form of a tradition well understood and worked upon by the intellect than of an original spiritual creation, and it is the intelligence that is prominent, accepting and observing established ideas and things in this frame and type and making its critical or reproductive observation and assent vivid with the strong lines and rich colours of artistic presentation and embellishing image. The original force, the intuitive vision work most strongly now in the outward, in the sensuous, the objective, the vital aspects of existence, and it is these that in this age are being more fully

taken up, brought out and made in the religious field a support for an extension of spiritual experience.

The sense of this evolution of the culture appears more clearly outside the range of pure literature in the philosophic writings of the time and in the religious poetry of the Puranas and Tantras. It was these two strains which mixing together and soon becoming a single whole proved to be the most living and enduring movement of the classical age, had the most abiding result in the mind of the people, were the creating force and made the most conspicuous part of the later popular literatures. It is a remarkable proof of the native disposition, capacity and profound spiritual intelligence and feeling of the national mind that the philosophic thinking of this period should have left behind it this immense influence; for it was of the highest and severest intellectual character. The tendency that had begun in earlier times and created Buddhism, Jainism and the great schools of philosophy, the labour of the metaphysical intellect to formulate to the reason the truths discovered by the intuitive spiritual experience, to subject them to the close test of a logical and severely dialectical ratiocination and to elicit from them all that the thought could discover, reaches its greatest power of elaborate and careful reasoning, minute criticism and analysis and forceful logical construction and systematisation in the abundant philosophical writing of the period between the sixth and thirteenth centuries marked especially by the work of the great southern thinkers, Shankara, Ramanuja and Madhwa. It did not cease even then, but survived its greatest days and continued even up to our own times throwing up sometimes great creative thinking and often new and subtle philosophical ideas in the midst of an incessant stream of commentary and criticism on established lines. Here there was no decline but a continued vigour of the metaphysical turn in the mind of the race. The work it did was to complete the diffusion of the philosophic intelligence with the result that even an average Indian mentality, once awakened, responds with a surprising quickness to the most subtle and profound ideas. It is notable that no Hindu religion old or new has been able to come into existence

without developing as its support a clear philosophic content and suggestion.

The philosophical writings in prose make no pretension to rank as literature; it is in these that the critical side is prominent, and they have no well-built creative shape, but there are other productions in which a more structural presentation of the complete thought is attempted and here the literary form adopted is ordinarily the philosophical poem. The preference for this form is a direct continuation of the tradition of the Upanishads and the Gita. These works cannot be given a very high place as poetry: they are too overweighted with thought and the preoccupation of an intellectual as distinguished from an intuitive adequacy in the phrase to have the breath of life and impetus of inspiration that are the indispensable attributes of the creative poetic mind. It is the critical and affirmative intelligence that is most active and not the vision seeing and interpretative. The epic greatness of the soul that sees and chants the self-vision and God-vision and supreme world-vision, the blaze of light that makes the power of the Upanishads, is absent, and absent too the direct thought springing straight from the soul's life and experience, the perfect, strong and suggestive phrase and the living beauty of the rhythmic pace that make the poetic greatness of the Gita. At the same time some of these poems are, if certainly not great poetry, yet admirable literature combining a supreme philosophical genius with a remarkable literary talent, not indeed creations, but noble and skilful constructions, embodying the highest possible thought, using well all the weighty, compact and sparing phrase of the classical Sanskrit speech, achieving the harmony and noble elegance of its rhythms. These merits are seen at their best in poems like the *Vivekacūḍāmaṇi* attributed to Shankara, and there we hear even, in spite of its too abstract turn, an intellectual echo of the voice of the Upanishads and the manner of the Gita. These poems, if inferior to the grandeur and beauty of earlier Indian work, are at least equal in poetic style and superior in height of thought to the same kind anywhere else and deservedly survive to fulfil the aim intended by their writers. And one must not omit to mention a few snatches of philosophic song here

and there that are a quintessence at once of philosophic thought and poetic beauty, or the abundant literature of hymns, many of them consummate in their power and fervour and their charm of rhythm and expression which prepare us for the similar but larger work in the later regional literature.

The philosophical creations of India differ in this respect from the bulk of the metaphysical thinking of Europe that even when they most adopt the intellectual form and method, yet their real substance is not intellectual, but is rather the result of a subtle and very profound intelligence working on the stuff of sight and spiritual experience. This is the result of the constant unity India has preserved between philosophy, religion and Yoga. The philosophy is the intuitive or intellectual presentation of the truth that was sought for first through the religious mind and its experiences and it is never satisfied by discovering truth to the idea and justifying it to the logical intelligence, although that is admirably done, but has its eye always turned to realisation in the soul's life, the object of Yoga. The thinking of this age, even in giving so much prominence to the intellectual side, does not depart from this constant need of the Indian temperament. It works out from spiritual experience through the exact and laborious inspection and introspection of the intellect and works backward and again from the intellectual perceptions to new gains of spiritual experience. There is indeed a tendency of fragmentation and exclusiveness; the great integral truth of the Upanishads has already been broken into divergent schools of thought and these are now farther subdividing into still less comprehensive systems; but still in each of these lessened provinces there is a gain of minute or intensive searching and on the whole, if a loss of breadth on the heights, in recompense some extension of assimilable spiritual knowledge. And this rhythm of exchange between the spirit and the intelligence, the spirit illuminating, the intelligence searching and arriving and helping the lower life to absorb the intuitions of the spirit, did its part in giving Indian spirituality a wonderful intensity, security and persistence not exemplified in any other people. It is indeed largely the work of these philosophers who were at the same time Yogins that

saved the soul of India alive through the gathering night of her decadence.

This however could not have been done without the aid of a great body of more easily seizable ideas, forms, images, appealing to the imagination, emotions, ethical and aesthetic sense of the people, that had to be partly an expression of the higher spiritual truth and partly a bridge of transition between the normal religious and the spiritual mentality. The need was met by the Tantras and Puranas. The Puranas are the religious poetry peculiar to this period: for although the form probably existed in ancient times, it is only now that it was entirely developed and became the characteristic and the principal literary expression of the religious spirit, and it is to this period that we must attribute, not indeed all the substance, but the main bulk and the existing shape of the Puranic writings. The Puranas have been much discredited and depreciated in recent times, since the coming in of modern ideas coloured by Western rationalism and the turning of the intelligence under new impulses back towards the earlier fundamental ideas of the ancient culture. Much however of this depreciation is due to an entire misunderstanding of the purpose, method and sense of the mediaeval religious writings. It is only in an understanding of the turn of the Indian religious imagination and of the place of these writings in the evolution of the culture that we can seize their sense.

In fact the better comprehension that is now returning to us of our own self and past shows that the Puranic religions are only a new form and extension of the truth of the ancient spirituality and philosophy and socio-religious culture. In their avowed intention they are popular summaries of the cosmogony, symbolic myth and image, tradition, cult, social rule of the Indian people continued, as the name Purana signifies, from ancient times. There is no essential change, but only a change of forms. The psychic symbols or true images of truth belonging to the Vedic age disappear or are relegated to a subordinate plan with a changed and diminished sense: others take their place more visibly large in aim, cosmic, comprehensive, not starting with conceptions drawn from the physical universe, but supplied

entirely from the psychic universe within us. The Vedic gods and goddesses conceal from the profane by their physical aspect their psychic and spiritual significance. The Puranic trinity and the forms of its female energies have on the contrary no meaning to the physical mind or imagination, but are philosophic and psychic conceptions and embodiments of the unity and multiplicity of the all-manifesting Godhead. The Puranic cults have been characterised as a degradation of the Vedic religion, but they might conceivably be described, not in the essence, for that remains always the same, but in the outward movement, as an extension and advance. Image worship and temple cult and profuse ceremony, to whatever superstition or externalism their misuse may lead, are not necessarily a degradation. The Vedic religion had no need of images, for the physical signs of its godheads were the forms of physical Nature and the outward universe was their visible house. The Puranic religion worshipped the psychical forms of the Godhead within us and had to express it outwardly in symbolic figures and house it in temples that were an architectural sign of cosmic significances. And the very inwardness it intended necessitated a profusion of outward symbol to embody the complexity of these inward things to the physical imagination and vision. The religious aesthetics has changed, but the meaning of the religion has been altered only in temperament and fashion, not in essence. The real difference is this that the early religion was made by men of the highest mystic and spiritual experience living among a mass still impressed mostly by the life of the physical universe: the Upanishads casting off the physical veil created a free transcendent and cosmic vision and experience and this was expressed by a later age to the mass in images containing a large philosophical and intellectual meaning of which the Trinity and the Shaktis of Vishnu and Shiva are the central figures: the Puranas carried forward this appeal to the intellect and imagination and made it living to the psychic experience, the emotions, the aesthetic feeling and the senses. A constant attempt to make the spiritual truths discovered by the Yojin and the Rishi integrally expressive, appealing, effective to the whole nature of man and to

provide outward means by which the ordinary mind, the mind of a whole people might be drawn to a first approach to them is the sense of the religio-philosophic evolution of Indian culture.

It is to be observed that the Puranas and Tantras contain in themselves the highest spiritual and philosophical truths, not broken up and expressed in opposition to each other as in the debates of the thinkers, but synthetised by a fusion, relation or grouping in the way most congenial to the catholicity of the Indian mind and spirit. This is done sometimes expressly, but most often in a form which might carry something of it to the popular imagination and feeling by legend, tale, symbol, analogue, miracle and parable. An immense and complex body of psycho-spiritual experience is embodied in the Tantras, supported by visual images and systematised in forms of Yogic practice. This element is also found in the Puranas, but more loosely and cast out in a less strenuous sequence. This method is after all simply a prolongation, in another form and with a temperamental change, of the method of the Vedas. The Puranas construct a system of physical images and observances each with its psychical significance. Thus the sacredness of the confluence of the three rivers, Ganga, Yamuna and Saraswati, is a figure of an inner confluence and points to a crucial experience in a psycho-physical process of Yoga and it has too other significances, as is common in the economy of this kind of symbolism. The so-called fantastic geography of the Puranas, as we are expressly told in the Puranas themselves, is a rich poetic figure, a symbolic geography of the inner psychical universe. The cosmogony expressed sometimes in terms proper to the physical universe has, as in the Veda, a spiritual and psychological meaning and basis. It is easy to see how in the increasing ignorance of later times the more technical parts of the Puranic symbology inevitably lent themselves to much superstition and to crude physical ideas about spiritual and psychic things. But that danger attends all attempts to bring them to the comprehension of the mass of men and this disadvantage should not blind us to the enormous effect produced in training the mass mind to respond to a psycho-religious and psycho-spiritual appeal that prepares a capacity

for higher things. That effect endures even though the Puranic system may have to be superseded by a finer appeal and the awakening to more directly subtle significances, and if such a supersession becomes possible, it will itself be due very largely to the work done by the Puranas.

The Puranas are essentially a true religious poetry, an art of aesthetic presentation of religious truth. All the bulk of the eighteen Puranas does not indeed take a high rank in this kind: there is much waste substance and not a little of dull and dreary matter, but on the whole the poetic method employed is justified by the richness and power of the creation. The earliest work is the best—with one exception at the end in a new style which stands by itself and is unique. The Vishnu Purana for instance in spite of one or two desert spaces is a remarkable literary creation of a very considerable quality maintaining much of the direct force and height of the old epic style. There is in it a varied movement, much vigorous and some sublime epic writing, an occasional lyrical element of a lucid sweetness and beauty, a number of narratives of the finest verve and skilful simplicity of poetic workmanship. The Bhagavat coming at the end and departing to a great extent from the more popular style and manner, for it is strongly affected by the learned and more ornately literary form of speech, is a still more remarkable production full of subtlety, rich and deep thought and beauty. It is here that we get the culmination of the movement which had the most important effects on the future, the evolution of the emotional and ecstatic religions of Bhakti. The tendency that underlay this development was contained in the earlier forms of the religious mind of India and was slowly gaining ground, but it had hitherto been overshadowed and kept from its perfect formation by the dominant tendency towards the austerities of knowledge and action and the seeking of the spiritual ecstasy only on the highest planes of being. The turn of the classical age outward to the exterior life and the satisfaction of the senses brought in a new inward turn of which the later ecstatic forms of the Vaishnava religion were the most complete manifestation. Confined to the secular and outward this fathoming of vital

and sensuous experience might have led only to a relaxation of nerve and vigour, an ethical degeneracy or licence; but the Indian mind is always compelled by its master impulse to reduce all its experience of life to the corresponding spiritual term and factor and the result was a transfiguring of even these most external things into a basis for new spiritual experience. The emotional, the sensuous, even the sensual motions of the being, before they could draw the soul farther outward, were taken and transmuted into a psychical form and, so changed, they became the elements of a mystic capture of the Divine through the heart and the senses and a religion of the joy of God's love, delight and beauty. In the Tantra the new elements are taken up and assigned their place in a complete psycho-spiritual and psycho-physical science of Yoga. Its popular form in the Vaishnava religion centres round the mystic analogue of the pastoral life of the child Krishna. In the Vishnu Purana the tale of Krishna is a heroic saga of the divine Avatar: in later Puranas we see the aesthetic and erotic symbol developing and in the Bhagavat it is given its full power and prepared to manifest its entire spiritual and philosophic as well as its psychic sense and to remould into its own lines by a shifting of the centre of synthesis from knowledge to spiritual love and delight the earlier significance of Vedanta. The perfect outcome of this evolution is to be found in the philosophy and religion of divine love promulgated by Chaitanya.

It is the later developments of Vedantic philosophy, the Puranic ideas and images and the poetic and aesthetic spirituality of the religions of devotion that inspired from their birth the regional literatures. The literature of the Sanskrit tongue does not come to any abrupt end. Poetry of the classical type continues to be written especially in the South down to a comparatively late period and Sanskrit remains still the language of philosophy and of all kinds of scholarship: all prose work, all the work of the critical mind is written in the ancient tongue. But the genius rapidly fades out from it, it becomes stiff, heavy and artificial and only a scholastic talent remains to keep it in continuance. In every province the local tongues arise here earlier, there a little later to the dignity of literature and become the vehicle of

poetic creation and the instrument of popular culture. Sanskrit, although not devoid of popular elements, is essentially and in the best sense an aristocratic speech developing and holding to the necessity of a noble aspiration and the great manner a high spiritual, intellectual, ethical and aesthetic culture, then possible in this manner only to the higher classes, and handing it down by various channels of impression and transfusion and especially by religion, art and social and ethical rule to the mass of the people. Pali in the hands of the Buddhists becomes a direct means of this transmission. The poetry of the regional tongues on the contrary creates, in every sense of the word, a popular literature. The Sanskrit writers were men of the three highest castes, mostly Brahmins and Kshatriyas, and later they were learned men writing for a highly cultured elite; the Buddhist writers too were for the most part philosophers, monks, kings, preachers writing sometimes for themselves, sometimes in a more popular form for the mass of the people; but the poetry of the regional tongues sprang straight from the heart of the people and its writers came from all classes from the Brahmin to the lowest Shudra and the outcaste. It is only in Urdu and to a less degree in the Southern tongues, as in Tamil whose great period is contemporaneous with the classical Sanskrit, its later production continuing during the survival of independent or semi-independent courts and kingdoms in the South, that there is a strong influence of the learned or classical temperament and habit; but even here there is a very considerable popular element as in the songs of the Shaiva saints and Vaishnava Alwars. The field here is too large to be easily known in its totality or to permit of a rapid survey, but something must be said of the character and value of this later literature that we may see how vital and persistently creative Indian culture remained even in a period which compared with its greater times might be regarded as a period of restriction and decadence.

As the Sanskrit literature begins with the Vedas and Upanishads, these later literatures begin with the inspired poetry of saints and devotees: for in India it is always a spiritual movement that is the source or at least imparts the impulse of formation

to new ideas and possibilities and initiates the changes of the national life. It is this kind that predominated almost throughout the creative activity of most of these tongues before modern times, because it was always poetry of this type that was nearest to the heart and mind of the people; and even where the work is of a more secular spirit, the religious turn enters into it and provides the framework, a part of the tone or the apparent motive. In abundance, in poetic excellence, in the union of spontaneous beauty of motive and lyrical skill this poetry has no parallel in its own field in any other literature. A sincerity of devotional feeling is not enough to produce work of this high turn of beauty, as is shown by the sterility of Christian Europe in this kind; it needs a rich and profound spiritual culture. Another part of the literature is devoted to the bringing of something of the essence of the old culture into the popular tongues through new poetic versions of the story of the Mahabharata and the Ramayana or in romantic narrative founded on the ancient legends; and here again we have work of the very greatest genius as well as much of a lesser but still high order. A third type presents vividly the religious beliefs and feelings of the people, the life of court and city and village and hamlet, of landholder and trader and artisan and peasant. The bulk of the work done in the regional tongues falls under one or other of these heads, but there are variations such as the religio-ethical and political poems of Ramdas in Maharashtra or the gnomic poetry, the greatest in plan, conception and force of execution ever written in this kind, of the Tamil saint, Tiruvalluvar. There is too in one or two of these languages a later erotic poetry not without considerable lyrical beauty of an entirely mundane inspiration. The same culture reigns amid many variations of form in all this work of the regional peoples, but each creates on the lines of its own peculiar character and temperament and this gives a different stamp, the source of a rich variety in the unity, to each of these beautiful and vigorous literatures.

Thus under the stress of temperamental variation the poetry of the Vaishnavas puts on very different artistic forms in different provinces. There is first the use of the psychical symbol created

by the Puranas, and this assumes its most complete and artistic shape in Bengal and becomes there a long continued tradition. The desire of the soul for God is there thrown into symbolic figure in the lyrical love cycle of Radha and Krishna, the Nature soul in man seeking for the Divine Soul through love, seized and mastered by his beauty, attracted by his magical flute, abandoning human cares and duties for this one overpowering passion and in the cadence of its phases passing through first desire to the bliss of union, the pangs of separation, the eternal longing and reunion, the *lilā* of the love of the human spirit for God. There is a settled frame and sequence, a subtly simple lyrical rhythm, a traditional diction of appealing directness and often of intense beauty. This accomplished lyrical form springs at once to perfect birth from the genius of the first two poets who used the Bengali tongue, Vidyapati, a consummate artist of word and line, and the inspired singer Chandidas in whose name stand some of the sweetest and most poignant and exquisite love-lyrics in any tongue. The symbol here is sustained in its most external figure of human passion and so consistently that it is now supposed by many to mean nothing else, but this is quite negatived by the use of the same figures by the devout poets of the religion of Chaitanya. All the spiritual experience that lay behind the symbol was embodied in that inspired prophet and incarnation of the ecstasy of divine love and its spiritual philosophy put into clear form in his teaching. His followers continued the poetic tradition of the earlier singers and though they fall below them in genius, yet left behind a great mass of this kind of poetry always beautiful in form and often deep and moving in substance. Another type is created in the perfect lyrics of the Rajput queen Mirabai, in which the images of the Krishna symbol are more directly turned into a song of the love and pursuit of the divine Lover by the soul of the singer. In the Bengal poetry the expression preferred is the symbolic figure impersonal to the poet: here a personal note gives the peculiar intensity to the emotion. This is given a still more direct turn by a southern poetess in the image of herself as the bride of Krishna. The peculiar power of this kind of Vaishnava religion and poetry

is in the turning of all the human emotions Godward, the passion of love being preferred as the intensest and most absorbing of them all, and though the idea recurs wherever there has been a strong development of devotional religion, it has nowhere been used with so much power and sincerity as in the work of the Indian poets.

Other Vaishnava poetry does not use the Krishna symbol, but is rather addressed in language of a more direct devotion to Vishnu or centres sometimes around the Rama Avatar. The songs of Tukaram are the best known of this kind. The Vaishnava poetry of Bengal avoids except very rarely any element of intellectualising thought and relies purely on emotional description, a sensuous figure of passion and intensity of feeling: Maratha poetry on the contrary has from the beginning a strong intellectual strain. The first Marathi poet is at once a devotee, a Yojin and a thinker; the poetry of the saint Ramdas, associated with the birth and awakening of a nation, is almost entirely a stream of religious ethical thinking raised to the lyrical pitch; and it is the penetrating truth and fervour of a thought arising from the heart of devotion that makes the charm and power of Tukaram's songs. A long strain of devotee poets keeps sounding the note that he struck and their work fills the greater space of Marathi poetry. The same type takes a lighter and more high-pitched turn in the poetry of Kabir. In Bengal again at the end of the Mahomedan period there is the same blending of fervent devotion with many depths and turns of religious thought in the songs of Ramprasad to the divine Mother, combined here with a vivid play of imagination turning all familiar things into apt and pregnant images and an intense spontaneity of feeling. In the South a profounder philosophic utterance is often fused into the devotional note, especially in the Shaiva poets, and, as in the early Sanskrit poetry, vivified by a great power of living phrase and image, and farther north the high Vedantic spirituality renews itself in the Hindi poetry of Surdas and inspires Nanak and the Sikh gurus. The spiritual culture prepared and perfected by two millenniums of the ancient civilisation has flooded the mind of all these peoples and given birth to great new literatures and

its voice is heard continually through all their course.

The narrative poetry of this age is less striking and original except for a certain number of great or famous works. Most of these tongues have felt the cultural necessity of transferring into the popular speech the whole central story of the Mahabharata or certain of its episodes and, still more universally, the story of the Ramayana. In Bengal there is the Mahabharata of Kashiram, the gist of the old epic simply retold in a lucid classical style, and the Ramayana of Krittibas, more near to the vigour of the soil, neither of them attaining to the epic manner but still written with a simple poetic skill and a swift narrative force. Only two however of these later poets arrived at a vividly living recreation of the ancient story and succeeded in producing a supreme masterpiece, Kamban, the Tamil poet who makes of his subject a great original epic, and Tulsidas whose famed Hindi Ramayana combines with a singular mastery lyric intensity, romantic richness and the sublimity of the epic imagination and is at once a story of the divine Avatar and a long chant of religious devotion. An English historian of the literature has even claimed for Tulsidas's poem superiority to the epic of Valmiki: that is an exaggeration and, whatever the merits, there cannot be a greater than the greatest, but that such claims can be made for Tulsidas and Kamban is evidence at least of the power of the poets and a proof that the creative genius of the Indian mind has not declined even in the narrowing of the range of its culture and knowledge. All this poetry indeed shows a gain in intensity that compensates to some extent for the loss of the ancient height and amplitude.

While this kind of narrative writing goes back to the epics, another seems to derive its first shaping and motive from the classical poems of Kalidasa, Bharavi and Magha. A certain number take for their subject, like that earlier poetry, episodes of the Mahabharata or other ancient or Puranic legends, but the classical and epic manner has disappeared, the inspiration resembles more that of the Puranas and there is the tone and the looser and easier development of the popular romance. This kind is commoner in western India and excellence in it is the title to fame of Premananda, the most considerable of the Gujerati

poets. In Bengal we find another type of half-romantic half-realistic narrative which develops a poetic picture of the religious mind and life and scenes of contemporary times and has a strong resemblance in its motive to the more outward element in the aim of Rajput painting. The life of Chaitanya written in a simple and naive romance verse, appealing by its directness and sincerity but inadequate in poetic form, is a unique contemporary presentation of the birth and foundation of a religious movement. Two other poems that have become classics, celebrate the greatness of Durga or Chandi, the goddess who is the Energy of Shiva,—the "Chandi" of Mukundaram, a pure romance of great poetic beauty which presents in its frame of popular legend a very living picture of the life of the people, and the "Annadamangal" of Bharatchandra repeating in its first part the Puranic tales of the gods as they might be imagined by the Bengali villager in the type of his own human life, telling in the second a romantic love story and in the third a historical incident of the time of Jehangir, all these disparate elements forming the development of the one central motive and presented without any imaginative elevation but with an unsurpassable vividness of description and power of vital and convincing phrase. All this poetry, the epic and the romance, the didactic poem, of which Ramdas and the famous Kural of Tiruvalluvar are the chief representatives, and the philosophic and devotional lyrics are not the creation or meant for the appreciation of a cultivated class, but with few exceptions the expression of a popular culture. The Ramayana of Tulsidas, the songs of Ramprasad and of the Bauls, the wandering Vaishnava devotees, the poetry of Ramdas and Tukaram, the sentences of Tiruvalluvar and the poetess Avvai and the inspired lyrics of the southern saints and Alwars were known to all classes and their thought or their emotion entered deeply into the life of the people.

I have dwelt at this length on the literature because it is, not indeed the complete, but still the most varied and ample record of the culture of a people. Three millenniums at least of a creation of this kind and greatness are surely the evidence of a real and very remarkable culture. The last period shows no

doubt a gradual decline, but one may note the splendour even of the decline and especially the continued vitality of religious, literary and artistic creation. At the moment when it seemed to be drawing to a close it has revived at the first chance and begins again another cycle, at first precisely in the three things that lasted the longest, spiritual and religious activity, literature and painting, but already the renewal promises to extend itself to all the many activities of life and culture in which India was once a great and leading people.

Indian Polity

I HAVE spoken hitherto of the greatness of Indian civilisation in the things most important to human culture, those activities that raise man to his noblest potentialities as a mental, a spiritual, religious, intellectual, ethical, aesthetic being, and in all these matters the cavillings of the critics break down before the height and largeness and profundity revealed when we look at the whole and all its parts in the light of a true understanding of the spirit and intention and a close discerning regard on the actual achievement of the culture. There is revealed not only a great civilisation, but one of the half dozen greatest of which we have a still existing record. But there are many who would admit the greatness of the achievement of India in the things of the mind and the spirit, but would still point out that she has failed in life, her culture has not resulted in a strong, successful or progressive organisation of life such as Europe shows to us, and that in the end at least the highest part of her mind turned away from life to asceticism and an inactive and world-shunning pursuit by the individual of his personal spiritual salvation. Or at most she has come only to a certain point and then there has been an arrest and decadence.

This charge weighs with an especial heaviness in the balance today because the modern man, even the modern cultured man, is or tends to be to a degree quite unprecedented *politikon zōon*, a political, economic and social being valuing above all things the efficiency of the outward existence and the things of the mind and spirit mainly, when not exclusively, for their aid to humanity's vital and mechanical progress: he has not that regard of the ancients which looked up towards the highest heights and regarded an achievement in the things of the mind and the spirit with an unquestioning admiration or a deep veneration for its own sake as the greatest possible contribution to human culture

and progress. And although this modern tendency is exaggerated and ugly and degrading in its exaggeration, inimical to humanity's spiritual evolution, it has this much of truth behind it that while the first value of a culture is its power to raise and enlarge the internal man, the mind, the soul, the spirit, its soundness is not complete unless it has shaped also his external existence and made of it a rhythm of advance towards high and great ideals. This is the true sense of progress and there must be as part of it a sound political, economic and social life, a power and efficiency enabling a people to survive, to grow and to move securely towards a collective perfection, and a vital elasticity and responsiveness that will give room for a constant advance in the outward expression of the mind and the spirit. If a culture does not serve these ends, then there is evidently a defect somewhere either in its essential conceptions or its wholeness or in its application that will seriously detract from its claims to a complete and integral value.

The ideals that governed the spirit and body of Indian society were of the highest kind, its social order secured an inexpugnable basic stability, the strong life force that worked in it was creative of an extraordinary energy, richness and interest, and the life organised remarkable in its opulence, variety in unity, beauty, productiveness, movement. All the records of Indian history, art and literature bear evidence to a cultural life of this character and even in decline and dissolution there survives some stamp of it to remind however faintly and distantly of the past greatness. To what then does the charge brought against Indian culture as an agent of the life power amount and what is its justification? In its exaggerated form it is founded upon the characteristics of the decline and dissolution, the features of the decadence read backward into the time of greatness, and it amounts to this that India has always shown an incompetence for any free or sound political organisation and has been constantly a divided and for the most part of her long history a subject nation, that her economic system whatever its bygone merits, if it had any, remained an inelastic and static order that led in modern conditions to poverty and failure and her

society an unprogressive hierarchy, caste-ridden, full of semi-barbaric abuses, only fit to be thrown on the scrap-heap among the broken rubbish of the past and replaced by the freedom, soundness and perfection or at least the progressive perfectibility of the European social order. It is necessary to reestablish the real facts and their meaning and afterwards it will be time to pass judgment on the political, the economic and the social aspects of Indian culture.

The legend of Indian political incompetence has arisen from a false view of the historical development and an insufficient knowledge of the ancient past of the country. It has long been currently supposed that she passed at once from the freer type of the primitive Aryan or Vedic social and political organisation to a system socially marked by the despotism of the Brahmin theocracy and politically by an absolute monarchy of the oriental, by which is meant the Western Asiatic, type and has remained fixed in these two things for ever after. That summary reading of Indian history has been destroyed by a more careful and enlightened scholarship and the facts are of a quite different nature. It is true that India never evolved either the scrambling and burdensome industrialism or the parliamentary organisation of freedom and self-styled democracy characteristic of the bourgeois or Vaishya period of the cycle of European progress. But the time is passing when the uncritical praise of these things as the ideal state and the last word of social and political progress was fashionable, their defects are now visible and the greatness of an oriental civilisation need not be judged by the standard of these Western developments. Indian scholars have attempted to read the modern ideas and types of democracy and even a parliamentary system into the past of India, but this seems to me an ill-judged endeavour. There was a strong democratic element, if we must use the Western terms, in Indian polity and even institutions that present a certain analogy to the parliamentary form, but in reality these features were of India's own kind and not at all the same thing as modern parliaments and modern democracy. And so considered they are a much more remarkable evidence of the political capacity of the Indian people in their

living adaptation to the ensemble of the social mind and body of the nation than when we judge them by the very different standard of Western society and the peculiar needs of its cultural cycle.

The Indian system began with a variation of the type generally associated with the early history of the Aryan peoples; but certain features have a more general character and belong to a still earlier stage in the social development of the human race. It was a clan or tribal system, Kula, founded upon the equality of all the freemen of the clan or race; this was not at first firmly founded upon the territorial basis, the migratory tendency was still in evidence or recurred under pressure and the land was known by the name of the people who occupied it, the Kuru country or simply the Kurus, the Malava country or the Malavas. After the fixed settlement within determined boundaries the system of the clan or tribe continued, but found a basic unit or constituent atom in the settled village community. The meeting of the people, *visah*, assembling for communal deliberation, for sacrifice and worship or as the host for war, remained for a long time the power-sign of the mass body and the agent of the active common life with the king as the head and representative, but long depending even after his position became hereditary on the assent of the people for his formal election or confirmation. The religious institution of the sacrifice developed in time a class of priests and inspired singers, men trained in the ritual or in possession of the mystic knowledge which lay behind the symbols of the sacrifice, the seed of the great Brahminic institution. These were not at first hereditary, but exercised other professions and belonged in their ordinary life to the general body of the people. This free and simple natural constitution of the society seems to have been general at first throughout Aryan India.

The later development out of this primitive form followed up to a certain point the ordinary line of evolution as we see it in other communities, but at the same time threw up certain very striking peculiarities that owing to the unique mentality of the race fixed themselves, became prominent characteristics

and gave a different stamp to the political, economic and social factors of Indian civilisation. The hereditary principle emerged at an early stage and increased constantly its power and hold on the society until it became everywhere the basis of the whole organisation of its activities. A hereditary kingship was established, a powerful princely and warrior class appeared, the rest of the people were marked off as the caste of traders, artisans and agriculturalists and a subject or menial caste was added, perhaps sometimes as the result of conquest but more probably or more commonly from economic necessity, of servants and labourers. The predominance from early times of the religious and spiritual tendency in the mind of the Indian people brought about at the top of the social system the growth of the Brahmin order, priests, scholars, legists, repositories of the sacred lore of the Vedas, a development paralleled elsewhere but here given an unequalled permanence and definiteness and supreme importance. In other countries with a less complex mentality this predominance might have resulted in a theocracy: but the Brahmins in spite of their ever-increasing and finally predominant authority did not and could not usurp in India the political power. As sacrosanct priests and legists and spiritual preceptors of the monarch and the people they exercised a very considerable influence, but the real or active political power remained with the king, the Kshatriya aristocracy and the commons.

A peculiar figure for some time was the Rishi, the man of a higher spiritual experience and knowledge, born in any of the classes, but exercising an authority by his spiritual personality over all, revered and consulted by the king of whom he was sometimes the religious preceptor and in the then fluid state of social evolution able alone to exercise an important role in evolving new basic ideas and effecting direct and immediate changes of the socio-religious ideas and customs of the people. It was a marked feature of the Indian mind that it sought to attach a spiritual meaning and a religious sanction to all, even to the most external social and political circumstances of its life, imposing on all classes and functions an ideal, not except incidentally of rights and powers, but of duties, a rule of their

action and an ideal way and temperament, character, spirit in the action, a dharma with a spiritual significance. It was the work of the Rishi to put this stamp enduringly on the national mind, to prolong and perpetuate it, to discover and interpret the ideal law and its practical meaning, to cast the life of the people into the well-shaped ideals and significant forms of a civilisation founded on the spiritual and religious sense. And in later ages we find the Brahminic schools of legists attributing their codes, though in themselves only formulations of existing rule and custom, to the ancient Rishis. Whatever the developments of the Indian socio-political body in later days, this original character still exercised its influence, even when all tended at last to become traditionalised and conventionalised instead of moving forward constantly in the steps of a free and living practice.

The political evolution of this early system varied in different parts of India. The ordinary development, as in most other countries, was in the direction of an increasing emphasis on the control of the king as the centre, head and unifying factor of a more and more complex system of rule and administration and this prevailed eventually and became the universal type. But for a long time it was combated and held in check by a contrary tendency that resulted in the appearance and the strong and enduring vitality of city or regional or confederated republics. The king became either a hereditary or elected executive head of the republic or an archon administering for a brief and fixed period or else he altogether disappeared from the polity of the state. This turn must have come about in many cases by a natural evolution of the power of the assemblies, but in others it seems to have been secured by some kind of revolution and there appear to have been vicissitudes, alternations between periods of monarchical and periods of republican government. Among a certain number of the Indian peoples the republican form finally asserted its hold and proved itself capable of a strong and settled organisation and a long duration lasting over many centuries. In some cases they were governed by a democratic assembly, in more by an oligarchical senate. It is unfortunate that we know little of the details of the constitution and nothing of the inner

history of these Indian republics, but the evidence is clear of the high reputation they enjoyed throughout India for the excellence of their civil and the formidable efficiency of their military organisation. There is an interesting dictum of Buddha that so long as the republican institutions were maintained in their purity and vigour, a small state of this kind would remain invincible even by the arms of the powerful and ambitious Magadhan monarchy, and this opinion is amply confirmed by the political writers who consider the alliance of the republics the most solid and valuable political and military support a king could have and advise their reduction not so much by the force of arms, as that would have a very precarious chance of success, but by Machiavellian means, — similar to those actually employed in Greece by Philip of Macedon, — aimed at undermining their internal unity and the efficiency of their constitution.

These republican states were already long established and in vigorous functioning in the sixth century before Christ, contemporary therefore with the brilliant but ephemeral and troubled Greek city commonwealths, but this form of political liberty in India long outlasted the period of Greek republican freedom. The ancient Indian mind, not less fertile in political invention, must be considered superior to that of the mercurial and restless Mediterranean people in the capacity for a firm organisation and settled constitutional order. Some of these states appear to have enjoyed a longer and a more settled history of vigorous freedom than republican Rome, for they persisted even against the mighty empire of Chandragupta and Asoka and were still in existence in the early centuries of the Christian era. But none of them developed the aggressive spirit and the conquering and widely organising capacity of the Roman republic; they were content to preserve their own free inner life and their independence. India especially after the invasion of Alexander felt the need of a movement of unification and the republics were factors of division: strong for themselves, they could do nothing for the organisation of the peninsula, too vast indeed for any system of confederation of small states to be possible — and indeed in the ancient world that endeavour nowhere succeeded, always it

broke down in the effort of expansion beyond certain narrow limits and could not endure against the movement towards a more centralised government. In India as elsewhere it was the monarchical state that grew and finally held the field replacing all other forms of political organisation. The republican organisation disappeared from her history and is known to us only by the evidence of coins, scattered references and the testimony of Greek observers and of the contemporary political writers and theorists who supported and helped to confirm and develop the monarchical state throughout India.

But Indian monarchy previous to the Mahomedan invasion was not, in spite of a certain sanctity and great authority conceded to the regal position and the personality of the king as the representative of the divine Power and the guardian of the Dharma, in any way a personal despotism or an absolutist autocracy: it had no resemblance to the ancient Persian monarchy or the monarchies of western and central Asia or the Roman imperial government or later European autocracies: it was of an altogether different type from the system of the Pathan or the Mogul emperors. The Indian king exercised supreme administrative and judicial power, was in possession of all the military forces of the kingdom and with his Council alone responsible for peace and war and he had too a general supervision and control over the good order and welfare of the life of the community, but his power was not personal and it was besides hedged in by safeguards against abuse and encroachment and limited by the liberties and powers of other public authorities and interests who were, so to speak, lesser copartners with him in the exercise of sovereignty and administrative legislation and control. He was in fact a limited or constitutional monarch, although the machinery by which the constitution was maintained and the limitation effected differed from the kind familiar in European history; and even the continuance of his rule was far more dependent than that of mediaeval European kings on the continued will and assent of the people.

A greater sovereign than the king was the Dharma, the religious, ethical, social, political, juridic and customary law

organically governing the life of the people. This impersonal authority was considered sacred and eternal in its spirit and the totality of its body, always characteristically the same, the changes organically and spontaneously brought about in its actual form by the evolution of the society being constantly incorporated in it, regional, family and other customs forming a sort of attendant and subordinate body capable of change only from within,—and with the Dharma no secular authority had any right of autocratic interference. The Brahmins themselves were recorders and exponents of the Dharma, not its creators nor authorised to make at will any changes, although it is evident that by an authoritative expression of opinion they could and did favour or oppose this or that tendency to change of principle or detail. The king was only the guardian, executor and servant of the Dharma, charged to see to its observance and to prevent offences, serious irregularities and breaches. He himself was bound the first to obey it and observe the rigorous rule it laid on his personal life and action and on the province, powers and duties of his regal authority and office.

This subjection of the sovereign power to the Dharma was not an ideal theory inoperative in practice; for the rule of the socio-religious law actively conditioned the whole life of the people and was therefore a living reality, and it had in the political field very large practical consequences. It meant first that the king had not the power of direct legislation and was limited to the issue of administrative decrees that had to be in consonance with the religious, social, political, economic constitution of the community,—and even here there were other powers than that of the king who shared with him the right of promulgating and seeing to the execution of administrative decrees independently issued,—neither could he disregard in the general tenor and character and the effective result of his administration the express or tacit will of the people.

The religious liberties of the commons were assured and could not normally be infringed by any secular authority; each religious community, each new or long-standing religion could shape its own way of life and institutions and had its own

authorities or governing bodies exercising in their proper field an entire independence. There was no exclusive State religion and the monarch was not the religious head of the people. Asoka in this respect seems to have attempted an extension of the royal control or influence and similar velleities were occasionally shown on a minor scale by other powerful sovereigns. But Asoka's so-called edicts of this kind had a recommendatory rather than an imperative character, and the sovereign who wished to bring about a change in religious belief or institutions had always, in accordance with the Indian principle of communal freedom and the obligation of a respect for and a previous consultation of the wishes of those concerned, to secure the assent of the recognised authorities or to refer the matter to a consultative assembly for deliberation, as was done in the famous Buddhist councils, or to arrange a discussion between the exponents of the different religions and abide by the issue. The monarch might personally favour a particular sect or creed and his active preference might evidently have a considerable propagandist influence, but at the same time he was bound to respect and support in his public office all the recognised religions of the people with a certain measure of impartiality, a rule that explains the support extended by Buddhist and Brahmin emperors to both the rival religions. At times there were, mainly in the south, instances of petty or violent State persecutions, but these outbreaks were a violation of the Dharma due to momentary passion at a time of acute religious ferment and were always local and of a brief duration. Normally there was no place in the Indian political system for religious oppression and intolerance and a settled State policy of that kind was unthinkable.

The social life of the people was similarly free from autocratic interference. Instances of royal legislation in this province are rare and here too, when it occurred, there had to be a consultation of the will of those concerned, as in the rearrangement or the reconstitution of the caste system by the Sena kings in Bengal after its disorganisation during a long period of Buddhist predominance. Change in the society was brought about not artificially from above but automatically from within and

principally by the freedom allowed to families or particular communities to develop or alter automatically their own rule of life, *ācāra*.

In the sphere of administration the power of the king was similarly hedged in by the standing constitution of the Dharma. His right of taxation was limited in the most important sources of revenue to a fixed percentage as a maximum and in other directions often by the right of the bodies representing the various elements of the community to a voice in the matter and always by the general rule that his right to govern was subject to the satisfaction and good-will of the people. This as we shall see, was not merely a pious wish or opinion of the Brahmin custodians of the Dharma. The king was in person the supreme court and the highest control in the execution of the civil and criminal law, but here too his role was that of the executor: he was bound to administer the law faithfully as it stood through his judges or with the aid of the Brahmin legists learned in these matters. He had the complete and unfettered control in his Council only of foreign policy, military administration and war and peace and of a great number of directive activities. He was free to make efficient arrangements for all that part of the administration that served to secure and promote the welfare of the community, good order, public morals, and all such matters as could best be supervised or regulated by the sovereign authority. He had a right of patronage and punishment consistent with the law and was expected to exercise it with a strict regard to an effect of general beneficence and promotion of the public welfare.

There could therefore be ordinarily little or no room in the ancient Indian system for autocratic freak or monarchical violence and oppression, much less for the savage cruelty and tyranny of so common an occurrence in the history of some other countries. Nevertheless such happenings were possible by the sovereign's disregard of the Dharma or by a misuse of his power of administrative decree; instances occurred of the kind,—though the worst recorded is that of a tyrant belonging to a foreign dynasty; in other cases any prolonged outbreak of autocratic caprice, violence or injustice seems to have led

before long to an effective protest or revolt on the part of the people. The legists provided for the possibility of oppression. In spite of the sanctity and prestige attaching to the sovereign it was laid down that obedience ceased to be binding if the king ceased to be faithful executor of the Dharma. Incompetence and violation of the obligation to rule to the satisfaction of the people were in theory and effect sufficient causes for his removal. Manu even lays it down that an unjust and oppressive king should be killed by his own subjects like a mad dog, and this justification by the highest authority of the right or even the duty of insurrection and regicide in extreme cases is sufficient to show that absolutism or the unconditional divine right of kings was no part of the intention of the Indian political system. As a matter of fact the right was actually exercised as we find both from history and literature. Another more peaceful and more commonly exercised remedy was a threat of secession or exodus which in most cases was sufficient to bring the delinquent ruler to reason. It is interesting to find the threat of secession employed against an unpopular monarch in the south as late as the seventeenth century, as well as a declaration by a popular assembly denouncing any assistance given to the king as an act of treason. A more common remedy was deposition by the council of ministers or by the public assemblies. The kingship thus constituted proved to be in effect moderate, efficient and beneficent, served well the purposes assigned to it and secured an abiding hold on the affections of the people. The monarchical institution was however only one, an approved and very important, but not, as we see from the existence of the ancient republics, an indispensable element of the Indian socio-political system, and we shall understand nothing of the real principle of the system and its working if we stop short with a view of the regal façade and fail to see what lay behind it. It is there that we shall find the clue to the essential character of the whole construction.

Indian Polity-2

THE TRUE nature of the Indian polity can only be realised if we look at it not as a separate thing, a machinery independent of the rest of the mind and life of the people, but as a part of and in its relation to the organic totality of the social existence.

A people, a great human collectivity, is in fact an organic living being with a collective or rather—for the word collective is too mechanical to be true to the inner reality—a common or communal soul, mind and body. The life of the society like the physical life of the individual human being passes through a cycle of birth, growth, youth, ripeness and decline, and if this last stage goes far enough without any arrest of its course towards decadence, it may perish,—even so all the older peoples and nations except India and China perished,—as a man dies of old age. But the collective being has too the capacity of renewing itself, of a recovery and a new cycle. For in each people there is a soul idea or life idea at work, less mortal than its body, and if this idea is itself sufficiently powerful, large and force-giving and the people sufficiently strong, vital and plastic in mind and temperament to combine stability with a constant enlargement or new application of the power of the soul idea or life idea in its being, it may pass through many such cycles before it comes to a final exhaustion. Moreover, the idea is itself only the principle of soul manifestation of the communal being and each communal soul again a manifestation and vehicle of the greater eternal spirit that expresses itself in Time and on earth is seeking, as it were, its own fullness in humanity through the vicissitudes of the human cycles. A people then which learns to live consciously not solely in its physical and outward life, not even only in that and the power of the life idea or soul idea that governs the changes of its development and is the key to its

psychology and temperament, but in the soul and spirit behind, may not at all exhaust itself, may not end by disappearance or a dissolution or a fusion into others or have to give place to a new race and people, but having itself fused into its life many original smaller societies and attained to its maximum natural growth pass without death through many renascences. And even if at any time it appears to be on the point of absolute exhaustion and dissolution, it may recover by the force of the spirit and begin another and perhaps a more glorious cycle. The history of India has been that of the life of such a people.

The master idea that has governed the life, culture, social ideals of the Indian people has been the seeking of man for his true spiritual self and the use of life—subject to a necessary evolution first of his lower physical, vital and mental nature—as a frame and means for that discovery and for man's ascent from the ignorant natural into the spiritual existence. This dominant idea India has never quite forgotten even under the stress and material exigencies and the externalities of political and social construction. But the difficulty of making the social life an expression of man's true self and some highest realisation of the spirit within him is immensely greater than that which attends a spiritual self-expression through the things of the mind, religion, thought, art, literature, and while in these India reached extraordinary heights and largenesses, she could not in the outward life go beyond certain very partial realisations and very imperfect tentatives,—a general spiritualising symbolism, an infiltration of the greater aspiration, a certain cast given to the communal life, the creation of institutions favourable to the spiritual idea. Politics, society, economics are the natural field of the two first and grosser parts of human aim and conduct recognised in the Indian system, interest and hedonistic desire: Dharma, the higher law, has nowhere been brought more than partially into this outer side of life, and in politics to a very minimum extent; for the effort at governing political action by ethics is usually little more than a pretence. The coordination or true union of the collective outward life with Moksha, the liberated spiritual existence, has hardly even been conceived or

attempted, much less anywhere succeeded in the past history of the yet hardly adult human race. Accordingly, we find that the governance by the Dharma of India's social, economic and even (though here the attempt broke down earlier than in other spheres) her political rule of life, system, turn of existence, with the adumbration of a spiritual significance behind,—the full attainment of the spiritual life being left as a supreme aim to the effort of the individual—was as far as her ancient system could advance. This much endeavour, however, she did make with persistence and patience and it gave a peculiar type to her social polity. It is perhaps for a future India, taking up and enlarging with a more complete aim, a more comprehensive experience, a more certain knowledge that shall reconcile life and the spirit, her ancient mission, to found the status and action of the collective being of man on the realisation of the deeper spiritual truth, the yet unrealised spiritual potentialities of our existence and so ensoul the life of her people as to make it the Lila of the greater Self in humanity, a conscious communal soul and body of Virat, the universal spirit.

Another point must be noted which creates a difference between the ancient polity of India and that of the European peoples and makes the standards of the West as inapplicable here as in the things of the mind and the inner culture. Human society has in its growth to pass through three stages of evolution before it can arrive at the completeness of its possibilities. The first is a condition in which the forms and activities of the communal existence are those of the spontaneous play of the powers and principles of its life. All its growth, all its formations, customs, institutions are then a natural organic development,—the motive and constructive power coming mostly from the subconscious principle of the life within it,—expressing, but without deliberate intention, the communal psychology, temperament, vital and physical need, and persisting or altering partly under the pressure of an internal impulse, partly under that of the environment acting on the communal mind and temper. In this stage the people is not yet intelligently self-conscious in the way of the reason, is not yet a thinking collective being, and it does

not try to govern its whole communal existence by the reasoning will, but lives according to its vital intuitions or their first mental renderings. The early framework of Indian society and polity grew up in such a period as in most ancient and mediaeval communities, but also in the later age of a growing social self-consciousness they were not rejected but only farther shaped, developed, systematised so as to be always, not a construction of politicians, legislators and social and political thinkers, but a strongly stable vital order natural to the mind, instincts and life intuitions of the Indian people.

A second stage of the society is that in which the communal mind becomes more and more intellectually self-conscious, first in its more cultured minds, then more generally, first broadly, then more and more minutely and in all the parts of its life. It learns to review and deal with its own life, communal ideas, needs, institutions in the light of the developed intelligence and finally by the power of the critical and constructive reason. This is a stage which is full of great possibilities but attended too by serious characteristic dangers. Its first advantages are those which go always with the increase of a clear and understanding and finally an exact and scientific knowledge and the culminating stage is the strict and armoured efficiency which the critical and constructive, the scientific reason used to the fullest degree offers as its reward and consequence. Another and greater outcome of this stage of social evolution is the emergence of high and luminous ideals which promise to raise man beyond the limits of the vital being, beyond his first social, economic and political needs and desires and out of their customary moulds and inspire an impulse of bold experiment with the communal life which opens a field of possibility for the realisation of a more and more ideal society. This application of the scientific mind to life with the strict, well-finished, armoured efficiency which is its normal highest result, this pursuit of great consciously proposed social and political ideals and the progress which is the index of the ground covered in the endeavour, have been, with whatever limits and drawbacks, the distinguishing advantages of the political and social effort of Europe.

On the other hand the tendency of the reason when it pretends to deal with the materials of life as its absolute governor, is to look too far away from the reality of the society as a living growth and to treat it as a mechanism which can be manipulated at will and constructed like so much dead wood or iron according to the arbitrary dictates of the intelligence. The sophisticating, labouring, constructing, efficient, mechanising reason loses hold of the simple principles of a people's vitality; it cuts it away from the secret roots of its life. The result is an exaggerated dependence on system and institution, on legislation and administration and the deadly tendency to develop, in place of a living people, a mechanical State. An instrument of the communal life tries to take the place of the life itself and there is created a powerful but mechanical and artificial organisation; but, as the price of this exterior gain, there is lost the truth of life of an organically self-developing communal soul in the body of a free and living people. It is this error of the scientific reason stifling the work of the vital and the spiritual intuition under the dead weight of its mechanical method which is the weakness of Europe and has deceived her aspiration and prevented her from arriving at the true realisation of her own higher ideals.

It is only by reaching a third stage of the evolution of the collective social as of the individual human being that the ideals first seized and cherished by the thought of man can discover their own real source and character and their true means and conditions of effectuation or the perfect society be anything more than a vision on a shining cloud constantly run after in a circle and constantly deceiving the hope and escaping the embrace. That will be when man in the collectivity begins to live more deeply and to govern his collective life neither primarily by the needs, instincts, intuitions welling up out of the vital self, nor secondarily by the constructions of the reasoning mind, but first, foremost and always by the power of unity, sympathy, spontaneous liberty, supple and living order of his discovered greater self and spirit in which the individual and the communal existence have their law of freedom, perfection and oneness. That is a rule that has not yet anywhere found its right conditions

for even beginning its effort, for it can only come when man's attempt to reach and abide by the law of the spiritual existence is no longer an exceptional aim for individuals or else degraded in its more general aspiration to the form of a popular religion, but is recognised and followed out as the imperative need of his being and its true and right attainment the necessity of the next step in the evolution of the race.

The small early Indian communities developed like others through the first stage of a vigorous and spontaneous vitality, finding naturally and freely its own norm and line, casting up form of life and social and political institution out of the vital intuition and temperament of the communal being. As they fused with each other into an increasing cultural and social unity and formed larger and larger political bodies, they developed a common spirit and a common basis and general structure allowing of a great freedom of variation in minor line and figure. There was no need of a rigid uniformity; the common spirit and life impulse were enough to impose on this plasticity a law of general oneness. And even when there grew up the great kingdoms and empires, still the characteristic institutions of the smaller kingdoms, republics, peoples were as much as possible incorporated rather than destroyed or thrown aside in the new cast of the socio-political structure. Whatever could not survive in the natural evolution of the people or was no longer needed, fell away of itself and passed into desuetude: whatever could last by modifying itself to new circumstance and environment, was allowed to survive: whatever was in intimate consonance with the psychical and the vital law of being and temperament of the Indian people became universalised and took its place in the enduring figure of the society and polity.

This spontaneous principle of life was respected by the age of growing intellectual culture. The Indian thinkers on society, economics and politics, Dharma Shastra and Artha Shastra, made it their business not to construct ideals and systems of society and government in the abstract intelligence, but to understand and regulate by the practical reason the institutions and ways of communal living already developed by the communal mind and

life and to develop, fix and harmonise without destroying the original elements, and whatever new element or idea was needed was added or introduced as a superstructure or a modifying but not a revolutionary and destructive principle. It was in this way that the transition from the earlier stages to the fully developed monarchical polity was managed; it proceeded by an incorporation of the existing institutions under the supreme control of the king or the emperor. The character and status of many of them was modified by the superimposition of the monarchical or imperial system, but, as far as possible, they did not pass out of existence. As a result we do not find in India the element of intellectually idealistic political progress or revolutionary experiment which has been so marked a feature of ancient and of modern Europe. A profound respect for the creations of the past as the natural expression of the Indian mind and life, the sound manifestation of its Dharma or right law of being, was the strongest element in the mental attitude and this preservative instinct was not disturbed but rather yet more firmly settled and fixed by the great millennium of high intellectual culture. A slow evolution of custom and institution conservative of the principle of settled order, of social and political precedent, of established framework and structure was the one way of progress possible or admissible. On the other hand, Indian polity never arrived at that unwholesome substitution of the mechanical for the natural order of the life of the people which has been the disease of European civilisation now culminating in the monstrous artificial organisation of the bureaucratic and industrial State. The advantages of the idealising intellect were absent, but so also were the disadvantages of the mechanising rational intelligence.

The Indian mind has always been profoundly intuitive in habit even when it was the most occupied with the development of the reasoning intelligence, and its political and social thought has therefore been always an attempt to combine the intuitions of life and the intuitions of the spirit with the light of the reason acting as an intermediary and an ordering and regulating factor. It has tried to base itself strongly on the established and persistent actualities of life and to depend for its idealism not

on the intellect but on the illuminations, inspirations, higher experiences of the spirit, and it has used the reason as a critical power testing and assuring the steps and aiding but not replacing the life and the spirit—always the true and sound constructors. The spiritual mind of India regarded life as a manifestation of the self: the community was the body of the creator Brahma, the people was a life body of Brahman in the *samasti*, the collectivity, it was the collective Narayana, as the individual was Brahman in the *vyasti*, the separate Jiva, the individual Narayana; the king was the living representative of the Divine and the other orders of the community the natural powers of the collective self, *prakrtayah*. The agreed conventions, institutes, customs, constitution of the body social and politic in all its parts had therefore not only a binding authority but a certain sacrosanct character.

The right order of human life as of the universe is preserved according to the ancient Indian idea by each individual being following faithfully his swadharma, the true law and norm of his nature and the nature of his kind and by the group being, the organic collective life, doing likewise. The family, clan, caste, class, social, religious, industrial or other community, nation, people are all organic group beings that evolve their own dharma and to follow it is the condition of their preservation, healthy continuity, sound action. There is also the dharma of the position, the function, the particular relation with others, as there is too the dharma imposed by the condition, environment, age, *yugadharma*, the universal religious or ethical dharma, and all these acting on the natural dharma, the action according to the Swabhava, create the body of the Law. The ancient theory supposed that in an entirely right and sound condition of man, individual and collective,—a condition typified by the legendary Golden Age, Satya Yuga, Age of Truth,—there is no need of any political government or State or artificial construction of society, because all then live freely according to the truth of their enlightened self and God-inhabited being and therefore spontaneously according to the inner divine Dharma. The self-determining individual and self-determining community living

according to the right and free law of his and its being is therefore the ideal. But in the actual condition of humanity, its ignorant and devious nature subject to perversions and violations of the true individual and the true social dharma, there has to be superimposed on the natural life of society a State, a sovereign power, a king or governing body, whose business is not to interfere unduly with the life of the society, which must be allowed to function for the most part according to its natural law and custom and spontaneous development, but to superintend and assist its right process and see that the Dharma is observed and in vigour and, negatively, to punish and repress and, as far as may be, prevent offences against the Dharma. A more advanced stage of corruption of the Dharma is marked by the necessity of the appearance of the legislator and the formal government of the whole of life by external or written law and code and rule; but to determine it — apart from external administrative detail — was not the function of the political sovereign, who was only its administrator, but of the socio-religious creator, the Rishi, or the Brahminic recorder and interpreter. And the Law itself written or unwritten was always not a thing to be new created or fabricated by a political and legislative authority, but a thing already existent and only to be interpreted and stated as it was or as it grew naturally out of pre-existing law and principle in the communal life and consciousness. The last and worst state of the society growing out of this increasing artificiality and convention must be a period of anarchy and conflict and dissolution of the dharma, — Kali Yuga, — which must precede through a red-grey evening of cataclysm and struggle a recovery and a new self-expression of the spirit in the human being.

The main function of the political sovereign, the king and council and the other ruling members of the body politic, was therefore to serve and assist the maintenance of the sound law of life of the society: the sovereign was the guardian and administrator of the Dharma. The function of society itself included the right satisfaction of the vital, economic and other needs of the human being and of his hedonistic claim to pleasure and enjoyment, but according to their right law and measure

of satisfaction and subject and subordinated to the ethical and social and religious dharma. All the members and groups of the socio-political body had their Dharma determined for them by their nature, their position, their relation to the whole body and must be assured and maintained in the free and right exercise of it, must be left to their own natural and self-determined functioning within their own bounds, but at the same time restrained from any transgression, encroachment or deviation from their right working and true limits. That was the office of the supreme political authority, the sovereign in his Council aided by the public assemblies. It was not the business of the state authority to interfere with or encroach upon the free functioning of the caste, religious community, guild, village, township or the organic custom of the region or province or to abrogate their rights, for these were inherent because necessary to the sound exercise of the social Dharma. All that it was called upon to do was to coordinate, to exercise a general and supreme control, to defend the life of the community against external attack or internal disruption, to repress crime and disorder, to assist, promote and regulate in its larger lines the economic and industrial welfare, to see to the provision of facilities, and to use for these purposes the powers that passed beyond the scope of the others.

Thus in effect the Indian polity was the system of a very complex communal freedom and self-determination, each group unit of the community having its own natural existence and administering its own proper life and business, set off from the rest by a natural demarcation of its field and limits, but connected with the whole by well-understood relations, each a copartner with the others in the powers and duties of the communal existence, executing its own laws and rules, administering within its own proper limits, joining with the others in the discussion and the regulation of matters of a mutual or common interest and represented in some way and to the degree of its importance in the general assemblies of the kingdom or empire. The State, sovereign or supreme political authority was an instrument of coordination and of a general control and efficiency and exercised a supreme but not an absolute authority; for in all its

rights and powers it was limited by the Law and by the will of the people and in all its internal functions only a copartner with the other members of the socio-political body.

This was the theory and principle and the actual constitution of the Indian polity, a complex of communal freedom and self-determination with a supreme coordinating authority, a sovereign person and body, armed with efficient powers, position and prestige, but limited to its proper rights and functions, at once controlling and controlled by the rest, admitting them as its active copartners in all branches, sharing the regulation and administration of the communal existence, and all alike, the sovereign, the people and all its constituent communities, bound to the maintenance and restrained by the yoke of the Dharma. Moreover the economic and political aspects of the communal life were only a part of the Dharma and a part not at all separate but inextricably united with all the rest, the religious, the ethical, the higher cultural aim of the social existence. The ethical law coloured the political and economic and was imposed on every action of the king and his ministers, the council and assemblies, the individual, the constituent groups of the society; ethical and cultural considerations counted in the use of the vote and the qualifications for minister, official and councillor; a high character and training was expected from all who held authority in the affairs of the Aryan people. The religious spirit and the reminders of religion were the head and the background of the whole life of king and people. The life of the society was regarded not so much as an aim in itself in spite of the necessary specialisation of parts of its system, but in all its parts and the whole as a great framework and training ground for the education of the human mind and soul and its development through the natural to the spiritual existence.

Indian Polity – 3

THE SOCIO-POLITICAL evolution of Indian civilisation, as far as one can judge from the available records, passed through four historical stages, first the simple Aryan community, then a long period of transition in which the national life was proceeding through a considerable variety of experimental formations in political structure and synthesis, thirdly, the definite formation of the monarchical state coordinating all the complex elements of the communal life of the people into regional and imperial unities, and last the era of decline in which there was an internal arrest and stagnation and an imposition of new cultures and systems from western Asia and Europe. The distinguishing character of the first three periods is a remarkable solidity and stability in all the formations and a sound and vital and powerful evolution of the life of the people rendered slow and leisurely by this fundamental conservative stability of the system but all the more sure in its building and living and complete in its structure. And even in the decline this solidity opposes a strong resistance to the process of demolition. The structure breaks up at the top under foreign pressure, but preserves for a long time its basis, keeps, wherever it can maintain itself against invasion, much of its characteristic system and is even towards the end capable of attempts at revival of its form and its spirit. And now too though the whole political system has disappeared and its last surviving elements have been ground out of existence, the peculiar social mind and temperament which created it remains even in the present social stagnation, weakness, perversion and disintegration and may yet in spite of immediate tendencies and appearances, once it is free to work again at its own will and after its own manner, proceed not along the Western line of evolution, but to a new creation out of its own spirit which may perhaps lead at the call of the demand now

vaguely beginning to appear in the advanced thought of the race towards the inception of the third stage of communal living and a spiritual basis of human society. In any case the long stability of its constructions and the greatness of the life they sheltered is certainly no sign of incapacity, but rather of a remarkable political instinct and capacity in the cultural mind of India.

The one principle permanent at the base of construction throughout all the building and extension and rebuilding of the Indian polity was the principle of an organically self-determining communal life,—self-determining not only in the mass and by means of the machinery of the vote and a representative body erected on the surface, representative only of the political mind of a part of the nation, which is all that the modern system has been able to manage, but in every pulse of its life and in each separate member of its existence. A free synthetic communal order was its character, and the condition of liberty it aimed at was not so much an individual as a communal freedom. In the beginning the problem was simple enough as only two kinds of communal unit had to be considered, the village and the clan, tribe or small regional people. The free organic life of the first was founded on the system of the self-governing village community and it was done with such sufficiency and solidity that it lasted down almost to our own days resisting all the wear and tear of time and the inroad of other systems and was only recently steam-rollered out of existence by the ruthless and lifeless machinery of the British bureaucratic system. The whole people living in its villages mostly on agriculture formed in the total a single religious, social, military and political body governing itself in its assembly, *samiti*, under the leadership of the king, as yet without any clear separation of functions or class division of labour.

It was the inadequacy of this system for all but the simplest form of agricultural and pastoral life and all but the small people living within a very limited area that compelled the problem of the evolution of a more complex communal system and a modified and more intricate application of the fundamental Indian principle. The agricultural and pastoral life common at first to

all the members of the Aryan community, *kṛṣṭayah*, remained always the large basis, but it developed an increasingly rich superstructure of commerce and industry and numerous arts and crafts and a smaller superstructure of specialised military and political and religious and learned occupations and functions. The village community remained throughout the stable unit, the firm grain or indestructible atom of the social body, but there grew up a group life of tens and hundreds of villages, each under its head and needing its administrative organisation, and these, as the clan grew into a large people by conquest or coalition with others, became constituents of a kingdom or a confederated republican nation, and these again the circles, *mandala*, of larger kingdoms and finally of one or more great empires. The test of the Indian genius for socio-political construction lay in the successful application of its principle of a communal self-determined freedom and order to suit this growing development and new order of circumstances.

The Indian mind evolved, to meet this necessity, the stable socio-religious system of the four orders. Outwardly this might seem to be only a more rigid form of the familiar social system developed naturally in most human peoples at one time or another, a priesthood, a military and political aristocracy, a class of artisans and free agriculturalists and traders and a proletariat of serfs or labourers. The resemblance however is only in the externals and the spirit of the system of Chaturvarna was different in India. In the later Vedic and the epic times the fourfold order was at once and inextricably the religious, social, political and economic framework of the society and within that framework each order had its natural portion and in none of the fundamental activities was the share or position of any of them exclusive. This characteristic is vital to an understanding of the ancient system, but has been obscured by false notions formed from a misunderstanding or an exaggeration of later phenomena and of conditions mostly belonging to the decline. The Brahmins, for example, had not a monopoly either of sacred learning or of the highest spiritual knowledge and opportunities. At first we see a kind of competition between the Brahmins and

the Kshatriyas for the spiritual lead and the latter for a long time held their own against the pretensions of the learned and sacerdotal order. The Brahmins, however, as logists, teachers, priests, men who could give their whole time and energy to philosophy, scholarship, the study of the sacred writings, prevailed in the end and secured a settled and imposing predominance. The priestly and learned class became the religious authorities, the custodians of the sacred books and the tradition, the interpreters of the law and Shastra, the recognised teachers in all the departments of knowledge, the ordinary religious preceptors or gurus of the other classes and supplied the bulk, though never the totality of the philosophers, thinkers, literary men, scholars. The study of the Vedas and Upanishads passed mainly into their hands, although always open to the three higher orders; it was denied in theory to the Shudras. As a matter of fact, however, a series of religious movements kept up even in the later days the essential element of the old freedom, brought the highest spiritual knowledge and opportunity to all doors and, as in the beginning we find the Vedic and Vedantic Rishis born from all classes, we find too up to the end the yogins, saints, spiritual thinkers, innovators and restorers, religious poets and singers, the fountain-heads of a living spirituality and knowledge as distinguished from traditional authority and lore, derived from all the strata of the community down to the lowest Shudras and even the despised and oppressed outcastes.

The four orders grew into a fixed social hierarchy, but, leaving aside the status of the outcastes, each had attached to it a spiritual life and utility, a certain social dignity, an education, a principle of social and ethical honour and a place and duty and right in the communal body. The system served again as an automatic means of securing a fixed division of labour and a settled economic status, the hereditary principle at first prevailing, although here even the theory was more rigid than the practice, but none was denied the right or opportunity of amassing wealth and making some figure in society, administration and politics by means of influence or status in his own order. For, finally, the social hierarchy was not at the same time a political hierarchy:

all the four orders had their part in the common political rights of the citizen and in the assemblies and administrative bodies their place and their share of influence. It may be noted too that in law and theory at least women in ancient India, contrary to the sentiment of other ancient peoples, were not denied civic rights, although in practice this equality was rendered nugatory for all but a few by their social subordination to the male and their domestic preoccupation; instances have yet survived in the existing records of women figuring, not only as queens and administrators and even in the battlefield, a common enough incident in Indian history, but as elected representatives on civic bodies.

The whole Indian system was founded upon a close participation of all the orders in the common life, each predominating in its own field, the Brahmin in religion, learning and letters, the Kshatriya in war, king-craft and interstate political action, the Vaishya in wealth-getting and productive economical function, but none, not even the Shudra, excluded from his share in the civic life and an effective place and voice in politics, administration, justice. As a consequence the old Indian polity at no time developed, or at least it did not maintain for long, those exclusive forms of class rule that have so long and powerfully marked the political history of other countries. A priestly theocracy, like that of Tibet, or the rule of a landed and military aristocracy that prevailed for centuries in France and England and other European countries or a mercantile oligarchy, as in Carthage and Venice, were forms of government foreign to the Indian spirit. A certain political predominance of the great Kshatriya families at a time of general war and strife and mobile expansion, when the clans and tribes were developing into nations and kingdoms and were still striving with each other for hegemony and overlordship, seems to be indicated in the traditions preserved in the Mahabharata and recurred in a cruder form in the return to the clan nation in mediaeval Rajputana: but in ancient India this was a passing phase and the predominance did not exclude the political and civic influence of men of the other orders or interfere with or exercise any oppressive control over the free

life of the various communal units. The democratic republics of the intermediate times were in all probability polities which endeavoured to preserve in its fullness the old principle of the active participation of the whole body of the people in the assemblies and not democracies of the Greek type; the oligarchical republics were clan governments or were ruled by more limited senates drawn from the dignified elements of the society and this afterwards developed into councils or assemblies representing all the four orders as in the later royal councils and urban bodies. In any case the system finally evolved was a mixed polity in which none of the orders had an undue predominance. Accordingly we do not find in India either that struggle between the patrician and plebeian elements of the community, the oligarchic and the democratic idea, ending in the establishment of an absolute monarchical rule, which characterises the troubled history of Greece and Rome or that cycle of successive forms evolving by a strife of classes,—first a ruling aristocracy, then replacing it by encroachment or revolution the dominance of the moneyed and professional classes, the regime of the bourgeois industrialising the society and governing and exploiting it in the name of the commons or masses and, finally, the present turn towards a rule of the proletariat of Labour,—which we see in later Europe. The Indian mind and temperament less exclusively intellectual and vital, more intuitively synthetic and flexible than that of the occidental peoples arrived, not certainly at any ideal system of society and politics, but at least at a wise and stable synthesis — not a dangerously unstable equilibrium, not a compromise or balance — of all the natural powers and orders, an organic and vital coordination respectful of the free functioning of all the organs of the communal body and therefore ensured, although not against the decadence that overtakes all human systems, at any rate against any organic disturbance or disorder.

The summit of the political structure was occupied by three governing bodies, the King in his ministerial council, the metropolitan assembly and the general assembly of the kingdom. The members of the Council and the ministers were drawn from all orders. The Council included a fixed number

of Brahmin, Kshatriya, Vaishya and Shudra representatives. The Vaishyas had indeed numerically a great preponderance, but this was a just proportion as it corresponded to their numerical preponderance in the body of the people: for in the early Aryan society the Vaishya order comprised not only the merchants and small traders but the craftsmen and artisans and the agriculturists and formed therefore the bulk of the commons, *viśah*, and the Brahmins, Kshatriyas, Shudras, however considerable the position and influence of the two higher orders, were later social growths and were comparatively very inferior in number. It was only after the confusion created by the Buddhist upheaval and the Brahminic reconstitution of the society in the age of cultural decadence that the mass of the cultivators and artisans and small traders sank in the greater part of India to the condition of Shudras with a small Brahmin mass at the top and in between a slight sprinkling of Kshatriyas and of Vaishyas. The Council, representing thus the whole community, was the supreme executive and administrative body and its assent and participation necessary to all the action and decrees of the sovereign in all more important matters of government, finance, policy, throughout the whole range of the communal interests. It was the King, the ministers and the council who aided by a system of boards of administration superintended and controlled all the various departments of the State action. The power of the king undoubtedly tended to grow with time and he was often tempted to act according to his own independent will and initiative; but still, as long as the system was in its vigour, he could not with impunity defy or ignore the opinion and will of the ministers and council. Even, it seems, so powerful and strong-willed a sovereign as the great emperor Asoka was eventually defeated in his conflict with his council and was forced practically to abdicate his power. The ministers in council could and did often proceed to the deposition of a recalcitrant or an incompetent monarch and replace him by another of his family or by a new dynasty and it was in this way that there came about several of the historic changes, as for example the dynastic revolution from the Mauryas to the

Sungas and again the initiation of the Kanwa line of emperors. As a matter of constitutional theory and ordinary practice all the action of the king was in reality that of the king in his council with the aid of his ministers and all his personal action was only valid as depending on their assent and in so far as it was a just and faithful discharge of the functions assigned to him by the Dharma. And as the Council was, as it were, a quintessential power body or action centre taking up into itself in a manageable compass, concentrating and representing in its constitution the four orders, the main elements of the social organism, the king too could only be the active head of this power and not, as in an autocratic regime, himself the State or the owner of the country and the irresponsible personal ruler of a nation of obedient subjects. The obedience owed by the people was due to the Law, the Dharma, and to the edicts of the King in council only as an administrative means for the service and maintenance of the Dharma.

At the same time a small body like the Council subject to the immediate and constant influence of the sovereign and his ministers might, if it had been the sole governing body, have degenerated into an instrument of autocratic rule. But there were two other powerful bodies in the State which represented on a larger scale the social organism, were a nearer and closer expression of its mind, life and will independent of the immediate regal influence and exercising large and constant powers of administration and administrative legislation and capable at all times of acting as a check on the royal power, since in case of their displeasure they could either get rid of an unpopular or oppressive king or render his administration impossible until he made submission to the will of the people. These were the great metropolitan and general assemblies sitting separately for the exercise each of its separate powers and together for matters concerning the whole people.¹ The Paura or metropolitan civic

¹ The facts about these bodies — I have selected only those that are significant for my purpose — are taken from the luminous and scrupulously documented contribution of Mr. Jayaswal to the subject.

assembly sat constantly in the capital town of the kingdom or empire—and under the imperial system there seem also to have been similar lesser bodies in the chief towns of the provinces, survivals of the assemblies that governed them when they were themselves capitals of independent kingdoms—and was constituted of representatives of the city guilds and the various caste bodies belonging to all the orders of the society or at least to the three lower orders. The guilds and caste bodies were themselves organic self-governing constituents of the community both in the country and the city and the supreme assembly of the citizens was not an artificial but an organic representation of the collective totality of the whole organism as it existed within the limits of the metropolis. It governed all the life of the city, acting directly or through subordinate lesser assemblies and administrative boards or committees of five, ten or more members, and, both by regulations and decrees which the guilds were bound to obey and by direct administration, controlled and supervised the commercial, industrial, financial and municipal affairs of the civic community. But in addition it was a power that had to be consulted and could take action in the wider affairs of the kingdom, sometimes separately and sometimes in cooperation with the general assembly, and its constant presence and functioning at the capital made it a force that had always to be reckoned with by the king and his ministers and their council. In a case of conflict with the royal ministers or governors even the distant civic parliaments in the provinces could make their displeasure felt if offended in matters of their position or privileges or discontented with the king's administrators and could compel the withdrawal of the offending officer.

The general assembly was similarly an organic representation of the mind and will of the whole country outside the metropolis; for it was composed of the deputies, elective heads or chief men of the townships and villages. A certain plutocratic element seems to have entered into its composition, as it was principally recruited from the wealthier men of the represented communities, and it was therefore something of the nature of an assembly of the commons not of an entirely democratic type,

— although unlike all but the most recent modern parliaments it included Shudras as well as Kshatriyas and Vaishyas,— but still a sufficiently faithful expression of the life and mind of the people. It was not however a supreme parliament: for it had ordinarily no fundamental legislative powers, any more than had the king and council or the metropolitan assembly, but only of decree and regulation. Its business was to serve as a direct instrument of the will of the people in the coordination of the various activities of the life of the nation, to see to the right direction of these and to the securing of the general order and welfare of the commerce, industry, agriculture, social and political life of the nation, to pass decrees and regulations to that purpose and secure privileges and facilities from the king and his council, to give or withhold the assent of the people to the actions of the sovereign and, if need be, to oppose him actively and prevent misgovernment or end it by the means open to the people's representatives. The joint session of the metropolitan and general assemblies was consulted in matters of succession, could depose the sovereign, alter the succession at his death, transfer the throne outside the reigning family, act sometimes as a supreme court of law in cases having a political tincture, cases of treason or of miscarriage of justice. The royal resolutions on any matter of State policy were promulgated to these assemblies and their assent had to be taken in all matters involving special taxation, war, sacrifice, large schemes of irrigation etc., and all questions of vital interest to the country. The two bodies seem to have sat constantly, for matters came up daily from them to the sovereign: their acts were registered by the king and had automatically the effect of law. It is clear indeed from a total review of their rights and activities that they were partners in the sovereignty and its powers were inherent in them and even those could be exercised by them on extraordinary occasions which were not normally within their purview. It is significant that Asoka in his attempt to alter the Dharma of the community, proceeded not merely by his royal decree but by discussion with the Assembly. The ancient description seems therefore to have been thoroughly justified which characterised the two bodies as

executors of the kingdom's activities and at need the instruments of opposition to the king's government.

It is not clear when these great institutions went out of existence, whether before the Mahomedan invasion or as a result of the foreign conquest. Any collapse of the system at the top leaving a gulf between the royal government, which would grow more autocratic by its isolation and in sole control of the larger national affairs, and the other constituents of the socio-political body each carrying on its own internal affairs, as was to the end the case with the village communities, but not in any living relation with the higher State matters, would obviously be, in an organisation of complex communal freedom where coordination of the life was imperatively needed, a great cause of weakness. In any case the invasion from Central Asia, bringing in a tradition of personal and autocratic rule unfamiliar with these restraints would immediately destroy such bodies, or their remnants or survivals wherever they still existed, and this happened throughout the whole of Northern India. The Indian political system was still maintained for many centuries in the south, but the public assemblies which went on existing there do not seem to have been of the same constitution as the ancient political bodies, but were rather some of the other communal organisations and assemblies of which these were a coordination and supreme instrument of control. These inferior assemblies included bodies originally of a political character, once the supreme governing institutions of the clan nation, *kula*, and the republic, *gana*. Under the new dispensation they remained in existence, but lost their supreme powers and could only administer with a subordinate and restricted authority the affairs of their constituent communities. The *kula* or clan family persisted, even after it had lost its political character, as a socio-religious institution, especially among the Kshatriyas, and preserved the tradition of its social and religious law, *kula-dharma*, and in some cases its communal assembly, *kula-sangha*. The public assemblies that we find even in quite recent times filling the role of the old general assembly in Southern India, more than one coexisting and acting separately or in unison, appear to have been variations

on this type of body. In Rajputana also the clan family, *kula*, recovered its political character and action, but in another form and without the ancient institutions and finer cultural temper, although they preserved in a high degree the Kshatriya dharma of courage, chivalry, magnanimity and honour.

A stronger permanent element in the Indian communal system, one that grew up in the frame of the four orders — in the end even replacing it — and acquired an extraordinary vitality, persistence and predominant importance was the historic and still tenacious though decadent institution of caste, *jāti*. Originally this rose from subdivisions of the four orders that grew up in each order under the stress of various forces. The subdivision of the Brahmin castes was mainly due to religious, socio-religious and ceremonial causes, but there were also regional and local divisions: the Kshatriyas remained for the most part one united order, though divided into *kulas*. On the other hand the Vaishya and Shudra orders split up into innumerable castes under the necessity of a subdivision of economic functions on the basis of the hereditary principle. Apart from the increasingly rigid application of the hereditary principle, this settled subdivision of function could well enough have been secured, as in other countries, by a guild system and in the towns we do find a vigorous and efficient guild system in existence. But the guild system afterwards fell into desuetude and the more general institution of caste became the one basis of economic function everywhere. The caste in town and village was a separate communal unit, at once religious, social and economic, and decided its religious, social and other questions, carried on its caste affairs and exercised jurisdiction over its members in a perfect freedom from all outside interference: only on fundamental questions of the Dharma the Brahmins were referred to for an authoritative interpretation or decision as custodians of the Shastra. As with the *kula*, each caste had its caste law and rule of living and conduct, *jāti-dharma*, and its caste communal assembly, *jāti-sangha*. As the Indian polity in all its institutions was founded on a communal and not on an individualistic basis, the caste also counted in the political and administrative functioning of the

kingdom. The guilds equally were self-functioning mercantile and industrial communal units, assembled for the discussion and administration of their affairs and had besides their united assemblies which seem at one time to have been the governing urban bodies. These guild governments, if they may so be called, — for they were more than municipalities, — disappeared afterwards into the more general urban body which represented an organic unity of both the guilds and the caste assemblies of all the orders. The castes as such were not directly represented in the general assembly of the kingdom, but they had their place in the administration of local affairs.

The village community and the township were the most tangibly stable basis of the whole system; but these, it must be noted, were not solely territorial units or a convenient mechanism for electoral, administrative or other useful social and political purposes, but always true communal unities with an organic life of their own that functioned in its own power and not merely as a subordinate part of the machinery of the State. The village community has been described as a little village republic, and the description is hardly an exaggeration: for each village was within its own limits autonomous and self-sufficient, governed by its own elected Panchayats and elected or hereditary officers, satisfying its own needs, providing for its own education, police, tribunals, all its economic necessities and functions, managing itself its own life as an independent and self-governing unit. The villages carried on also their affairs with each other by combinations of various kinds and there were too groups of villages under elected or hereditary heads and forming therefore, though in a less closely organised fashion, a natural body. But the townships in India were also in a hardly less striking way autonomous and self-governing bodies, ruled by their own assembly and committees with an elective system and the use of the vote, managing their own affairs in their own right and sending like the villages their representative men to the general assembly of the kingdom. The administration of these urban governments included all works contributing to the material or other welfare of the citizens, police, judicial cases, public works and the

charge of sacred and public places, registration, the collection of municipal taxes and all matters relating to trade, industry and commerce. If the village community can be described as a little village republic, the constitution of the township can equally be described as a larger urban republic. It is significant that the Naigama and Paura assemblies,—the guild governments and the metropolitan bodies,—had the privilege of striking coins of their own, a power otherwise exercised only by the monarchical heads of States and the republics.

Another kind of community must be noted, those which had no political existence, but were yet each in its own kind a self-governing body; for they illustrate the strong tendency of Indian life to throw itself in all its manifestations into a closely communal form of existence. One example is the joint family, prevalent everywhere in India and only now breaking down under the pressure of modern conditions, of which the two fundamental principles were first a communal holding of the property by the agnates and their families and, as far as possible, an undivided communal life under the management of the head of the family and, secondly, the claim of each male to an equal portion in the share of his father, a portion due to him in case of separation and division of the estate. This communal unity with the persistent separate right of the individual is an example of the synthetic turn of the Indian mind and life, its recognition of fundamental tendencies and its attempt to harmonise them even if they seemed in their norm of practice to be contradictory to each other. It is the same synthetic turn as that which in all parts of the Indian socio-political system tended to fuse together in different ways the theocratic, the monarchic and aristocratic, the plutocratic and the democratic tendencies in a whole which bore the characteristics of none of them nor was yet an accommodation of them or amalgamation whether by a system of checks and balances or by an intellectually constructed synthesis, but rather a natural outward form of the inborn tendencies and character of the complex social mind and temperament.

At the other end, forming the ascetic and purely spiritual extreme of the Indian life-mind, we find the religious community

and, again, this too takes a communal shape. The original Vedic society had no place for any Church or religious community or ecclesiastical order, for in its system the body of the people formed a single socio-religious whole with no separation into religious and secular, layman and cleric, and in spite of later developments the Hindu religion has held, in the whole or at least as the basis, to this principle. On the other hand an increasing ascetic tendency that came in time to distinguish the religious from the mundane life and tended to create the separate religious community, was confirmed by the rise of the creeds and disciplines of the Buddhists and the Jains. The Buddhist monastic order was the first development of the complete figure of the organised religious community. Here we find that Buddha simply applied the known principles of the Indian society and polity to the ascetic life. The order he created was intended to be a *dharma-saṅgha*, and each monastery a religious commune living the life of a united communal body which existed as the expression and was based in all the rules, features, structure of its life on the maintenance of the Dharma as it was understood by the Buddhists. This was, as we can at once see, precisely the principle and theory of the whole Hindu society, but given here the higher intensity possible to the spiritual life and a purely religious body. It managed its affairs too like the Indian social and political communal unities. An assembly of the order discussed debatable questions of the Dharma and its application and proceeded by vote as in the meeting-halls of the republics, but it was subject still to a limiting control intended to avoid the possible evils of a too purely democratic method. The monastic system once thus firmly established was taken over from Buddhism by the orthodox religion, but without its elaborate organisation. These religious communities tended, wherever they could prevail against the older Brahminic system, as in the order created by Shankaracharya, to become a sort of ecclesiastical head to the lay body of the community, but they arrogated to themselves no political position and the struggle between Church and State is absent from the political history of India.

It is clear therefore that the whole life of ancient India retained even in the time of the great kingdoms and empires its first principle and essential working and its social polity remained fundamentally a complex system of self-determined and self-governing communal bodies. The evolution of an organised State authority supervening on this system was necessitated in India as elsewhere partly by the demand of the practical reason for a more stringent and scientifically efficient coordination than was possible except in small areas to the looser natural coordination of life, and more imperatively by the need of a systematised military aggression and defence and international action concentrated in the hands of a single central authority. An extension of the free republican State might have sufficed to meet the former demand, for it had the potentiality and the necessary institutions, but the method of the monarchical State with its more constricted and easily tangible centrality presented a more ready and manageable device and a more facile and apparently efficient machinery. And for the external task, involving almost from the commencement the supremely difficult age-long problem of the political unification of India, then a continent rather than a country, the republican system, more suited to strength in defence than for aggression, proved in spite of its efficient military organisation to be inadequate. It was, therefore, in India as elsewhere, the strong form of the monarchical State that prevailed finally and swallowed up the others. At the same time the fidelity of the Indian mind to its fundamental intuitions and ideals preserved the basis of communal self-government natural to the temperament of the people, prevented the monarchical State from developing into an autocracy or exceeding its proper functions and stood successfully in the way of its mechanising the life of the society. It is only in the long decline that we find the free institutions that stood between the royal government and the self-determining communal life of the people either tending to disappear or else to lose much of their ancient power and vigour and the evils of personal government, of a bureaucracy of scribes and officials and of a too preponderant centralised authority commencing to manifest in some sensible measure.

As long as the ancient traditions of the Indian polity remained and in proportion as they continued to be vital and effective, these evils remained either sporadic and occasional or could not assume any serious proportions. It was the combination of foreign invasion and conquest with the slow decline and final decadence of the ancient Indian culture that brought about the collapse of considerable parts of the old structure and the degradation and disintegration, with no sufficient means for revival or new creation, of the socio-political life of the people.

At the height of its evolution and in the great days of Indian civilisation we find an admirable political system efficient in the highest degree and very perfectly combining communal self-government with stability and order. The State carried on its work administrative, judicial, financial and protective without destroying or encroaching on the rights and free activities of the people and its constituent bodies in the same departments. The royal courts in capital and country were the supreme judicial authority coordinating the administration of justice throughout the kingdom, but they did not unduly interfere with the judicial powers entrusted to their own courts by the village and urban communes and, even, the regal system associated with itself the guild, caste and family courts, working as an ample means of arbitration and only insisted on its own exclusive control of the more serious criminal offences. A similar respect was shown to the administrative and financial powers of the village and urban communes. The king's governors and officials in town and country existed side by side with the civic governors and officials and the communal heads and officers appointed by the people and its assemblies. The State did not interfere with the religious liberty or the established economic and social life of the nation; it confined itself to the maintenance of social order and the provision of a needed supervision, support, coordination and facilities for the rich and powerful functioning of all the national activities. It understood too always and magnificently fulfilled its opportunities as a source of splendid and munificent stimulation to the architecture, art, culture, scholarship, literature already created by the communal mind of India. In the person of the

monarch it was the dignified and powerful head and in the system of his administration the supreme instrument—neither an arbitrary autocracy or bureaucracy, nor a machine oppressing or replacing life—of a great and stable civilisation and a free and living people.

Indian Polity – 4

ARIGHT knowledge of the facts and a right understanding of the character and principle of the Indian socio-political system disposes at once of the contention of occidental critics that the Indian mind, even if remarkable in metaphysics, religion, art and literature was inapt for the organisation of life, inferior in the works of the practical intelligence and, especially, that it was sterile in political experiment and its record empty of sound political construction, thinking and action. On the contrary, Indian civilisation evolved an admirable political system, built solidly and with an enduring soundness, combined with a remarkable skill the monarchical, democratic and other principles and tendencies to which the mind of man has leaned in its efforts of civic construction and escaped at the same time the excess of the mechanising turn which is the defect of the modern European State. I shall consider afterwards the objections that can be made to it from the evolutionary standpoint of the West and its idea of progress.

But there is another side of politics on which it may be said that the Indian political mind has registered nothing but failure. The organisation it developed may have been admirable for stability and effective administration and the securing of communal order and liberties and the well-being of the people under ancient conditions, but even if its many peoples were each of them separately self-governed, well governed and prosperous and the country at large assured in the steady functioning of a highly developed civilisation and culture, yet that organisation failed to serve for the national and political unification of India and failed in the end to secure it against foreign invasion, the disruption of its institutions and an agelong servitude. The political system of a society has to be judged, no doubt first and foremost by the stability, prosperity, internal freedom and order

it ensures to the people, but also it must be judged by the security it erects against other States, its unity and power of defence and aggression against external rivals and enemies. It is not perhaps altogether to the credit of humanity that it should be so and a nation or people that is inferior in this kind of political strength, as were the ancient Greeks and mediaeval Italians, may be spiritually and culturally far superior to its conquerors and may well have contributed more to a true human progress than successful military States, aggressive communities, predatory empires. But the life of man is still predominatingly vital and moved therefore by the tendencies of expansion, possession, aggression, mutual struggle for absorption and dominant survival which are the first law of life, and a collective mind and consciousness that gives a constant proof of incapacity for aggression and defence and does not organise the centralised and efficient unity necessary to its own safety, is clearly one that in the political field falls far short of the first order. India has never been nationally and politically one. India was for close on a thousand years swept by barbaric invasions and for almost another thousand years in servitude to successive foreign masters. It is clear therefore that judgment of political incapacity must be passed against the Indian people.

Here again the first necessity is to get rid of exaggerations, to form a clear idea of the actual facts and their significance and understand the tendencies and principles involved in the problem that admittedly throughout the long history of India escaped a right solution. And first if the greatness of a people and a civilisation is to be reckoned by its military aggressiveness, its scale of foreign conquest, its success in warfare against other nations and the triumph of its organised acquisitive and predatory instincts, its irresistible push towards annexation and exploitation, it must be confessed that India ranks perhaps the lowest in the list of the world's great peoples. At no time does India seem to have been moved towards an aggressive military and political expansion beyond her own borders; no epic of world dominion, no great tale of far-borne invasion or expanding colonial empire has ever been written in the tale of Indian achievement. The sole great

endeavour of expansion, of conquest, of invasion she attempted was the expansion of her culture, the invasion and conquest of the Eastern world by the Buddhistic idea and the penetration of her spirituality, art and thought-forces. And this was an invasion of peace and not of war, for to spread a spiritual civilisation by force and physical conquest, the vaunt or the excuse of modern imperialism, would have been uncongenial to the ancient cast of her mind and temperament and the idea underlying her Dharma. A series of colonising expeditions carried indeed Indian blood and Indian culture to the islands of the archipelago, but the ships that set out from both the eastern and western coast were not fleets of invaders missioned to annex those outlying countries to an Indian empire but of exiles or adventurers carrying with them to yet uncultured peoples Indian religion, architecture, art, poetry, thought, life, manners. The idea of empire and even of world-empire was not absent from the Indian mind, but its world was the Indian world and the object the founding of the imperial unity of its peoples.

This idea, the sense of this necessity, a constant urge towards its realisation is evident throughout the whole course of Indian history from earlier Vedic times through the heroic period represented by the traditions of the Ramayana and Mahabharata and the effort of the imperial Mauryas and Guptas up to the Mogul unification and the last ambition of the Peshwas, until there came the final failure and the levelling of all the conflicting forces under a foreign yoke, a uniform subjection in place of the free unity of a free people. The question then is whether the tardiness, the difficulty, the fluctuating movements of the process and the collapse of the long effort were due to a fundamental incapacity in the civilisation or in the political consciousness and ability of the people or to other forces. A great deal has been said and written about the inability of Indians to unite, the want of a common patriotism — now only being created, it is said, by the influence of Western culture — and the divisions imposed by religion and caste. Admitting even in their full degree the force of these strictures, — all of them are not altogether true or rightly stated or vitally applicable to the matter, — they are only

symptoms and we have still to seek for the deeper causes.

The reply made for the defence is usually that India is practically a continent almost as large as Europe containing a great number of peoples and the difficulties of the problem have been as great or at least almost as considerable. And if then it is no proof of the insufficiency of Western civilisation or of the political incapacity of the European peoples that the idea of European unity should still remain an ineffective phantasm on the ideal plane and to this day impossible to realise in practice, it is not just to apply a different system of values to the much more clear ideal of unity or at least of unification, the persistent attempt at its realisation and the frequent near approach to success that marked the history of the Indian peoples. There is some force in the contention, but it is not in the form entirely apposite, for the analogy is far from perfect and the conditions were not quite of the same order. The peoples of Europe are nations very sharply divided from each other in their collective personality, and their spiritual unity in the Christian religion or even their cultural unity in a common European civilisation, never so real and complete as the ancient spiritual and cultural unity of India, was also not the very centre of their life, not its basis or firm ground of existence, not its supporting earth but only its general air or circumambient atmosphere. Their base of existence lay in the political and economic life which was strongly separate in each country, and it was the very strength of the political consciousness in the Western mind that kept Europe a mass of divided and constantly warring nations. It is only the increasing community of political movements and the now total economic interdependence of the whole of Europe that has at last created not any unity, but a nascent and still ineffective League of Nations struggling vainly to apply the mentality born of an agelong separatism to the common interests of the European peoples. But in India at a very early time the spiritual and cultural unity was made complete and became the very stuff of the life of all this great surge of humanity between the Himalayas and the two seas. The peoples of ancient India were never so much distinct nations sharply divided from each other by a separate political

and economic life as sub-peoples of a great spiritual and cultural nation itself firmly separated, physically, from other countries by the seas and the mountains and from other nations by its strong sense of difference, its peculiar common religion and culture. The creation of a political unity, however vast the area and however many the practical difficulties, ought therefore to have been effected more easily than could possibly be the unity of Europe. The cause of the failure must be sought deeper down and we shall find that it lay in a dissidence between the manner in which the problem was or ought to have been envisaged and the actual turn given to the endeavour and in the latter a contradiction of the peculiar mentality of the people.

The whole basis of the Indian mind is its spiritual and inward turn, its propensity to seek the things of the spirit and the inner being first and foremost and to look at all else as secondary, dependent, to be handled and determined in the light of the higher knowledge and as an expression, a preliminary, field or aid or at least a pendent to the deeper spiritual aim,—a tendency therefore to create whatever it had to create first on the inner plane and afterwards in its other aspects. This mentality and this consequent tendency to create from within outwards being given, it was inevitable that the unity India first created for herself should be the spiritual and cultural oneness. It could not be, to begin with, a political unification effected by an external rule centralised, imposed or constructed, as was done in Rome or ancient Persia, by a conquering kingdom or the genius of a military and organising people. It cannot, I think, justly be said that this was a mistake or a proof of the unpractical turn of the Indian mind and that the single political body should have been created first and afterwards the spiritual unity could have securely grown up in the vast body of an Indian national empire. The problem that presented itself at the beginning was that of a huge area containing more than a hundred kingdoms, clans, peoples, tribes, races, in this respect another Greece, but a Greece on an enormous scale, almost as large as modern Europe. As in Greece a cultural Hellenic unity was necessary to create a fundamental feeling of oneness, here too and much more imperatively

a conscious spiritual and cultural unity of all these peoples was the first, the indispensable condition without which no enduring unity could be possible. The instinct of the Indian mind and of its great Rishis and founders of its culture was sound in this matter. And even if we suppose that an outward imperial unity like that of the Roman world could have been founded among the peoples of early India by military and political means, we must not forget that the Roman unity did not endure, that even the unity of ancient Italy founded by the Roman conquest and organisation did not endure, and it is not likely that a similar attempt in the vast reaches of India without the previous spiritual and cultural basis would have been of an enduring character. It cannot be said either, even if the emphasis on spiritual and cultural unity be pronounced to have been too engrossing or excessive and the insistence on political and external unity too feeble, that the effect of this precedence has been merely disastrous and without any advantage. It is due to this original peculiarity, to this indelible spiritual stamp, to this underlying oneness amidst all diversities that if India is not yet a single organised political nation, she still survives and is still India.

After all the spiritual and cultural is the only enduring unity and it is by a persistent mind and spirit much more than by an enduring physical body and outward organisation that the soul of a people survives. This is a truth the positive Western mind may be unwilling to understand or concede, and yet its proofs are written across the whole story of the ages. The ancient nations, contemporaries of India, and many younger born than she are dead and only their monuments left behind them. Greece and Egypt exist only on the map and in name, for it is not the soul of Hellas or the deeper nation-soul that built Memphis which we now find at Athens or at Cairo. Rome imposed a political and a purely outward cultural unity on the Mediterranean peoples, but their living spiritual and cultural oneness she could not create, and therefore the east broke away from the west, Africa kept no impress of the Roman interlude, and even the western nations still called Latin could offer no living resistance to barbarian invaders and had to be reborn

by the infusion of a foreign vitality to become modern Italy, Spain and France. But India still lives and keeps the continuity of her inner mind and soul and spirit with the India of the ages. Invasion and foreign rule, the Greek, the Parthian and the Hun, the robust vigour of Islam, the levelling steam-roller heaviness of the British occupation and the British system, the enormous pressure of the Occident have not been able to drive or crush the ancient soul out of the body her Vedic Rishis made for her. At every step, under every calamity and attack and domination, she has been able to resist and survive either with an active or a passive resistance. And this she was able to do in her great days by her spiritual solidarity and power of assimilation and reaction, expelling all that would not be absorbed, absorbing all that could not be expelled, and even after the beginning of the decline she was still able to survive by the same force, abated but not slayable, retreating and maintaining for a time her ancient political system in the south, throwing up under the pressure of Islam Rajput and Sikh and Mahratta to defend her ancient self and its idea, persisting passively where she could not resist actively, condemning to decay each empire that could not answer her riddle or make terms with her, awaiting always the day of her revival. And even now it is a similar phenomenon that we see in process before our eyes. And what shall we say then of the surpassing vitality of the civilisation that could accomplish this miracle and of the wisdom of those who built its foundation not on things external but on the spirit and the inner mind and made a spiritual and cultural oneness the root and stock of her existence and not solely its fragile flower, the eternal basis and not the perishable superstructure?

But spiritual unity is a large and flexible thing and does not insist like the political and external on centralisation and uniformity; rather it lives diffused in the system and permits readily a great diversity and freedom of life. Here we touch on the secret of the difficulty in the problem of unifying ancient India. It could not be done by the ordinary means of a centralised uniform imperial State crushing out all that made for free divergence, local autonomies, established communal liberties,

and each time that an attempt was made in this direction, it has failed after however long a term of apparent success, and we might even say that the guardians of India's destiny wisely compelled it to fail that her inner spirit might not perish and her soul barter for an engine of temporary security the deep sources of its life. The ancient mind of India had the intuition of its need; its idea of empire was a uniting rule that respected every existing regional and communal liberty, that unnecessarily crushed out no living autonomy, that effected a synthesis of her life and not a mechanical oneness. Afterwards the conditions under which such a solution might securely have evolved and found its true means and form and basis, disappeared and there was instead an attempt to establish a single administrative empire. That endeavour, dictated by the pressure of an immediate and external necessity, failed to achieve a complete success in spite of its greatness and splendour. It could not do so because it followed a trend that was not eventually compatible with the true turn of the Indian spirit. It has been seen that the underlying principle of the Indian politico-social system was a synthesis of communal autonomies, the autonomy of the village, of the town and capital city, of the caste, guild, family, *kula*, religious community, regional unit. The state or kingdom or confederated republic was a means of holding together and synthetising in a free and living organic system these autonomies. The imperial problem was to synthetise again these states, peoples, nations, effecting their unity but respecting their autonomy, into a larger free and living organism. A system had to be found that would maintain peace and oneness among its members, secure safety against external attack and totalise the free play and evolution, in its unity and diversity, in the uncoerced and active life of all its constituent communal and regional units, of the soul and body of Indian civilisation and culture, the functioning on a grand and total scale of the Dharma.

This was the sense in which the earlier mind of India understood the problem. The administrative empire of later times accepted it only partially, but its trend was, very slowly and almost subconsciously, what the centralising tendency must always be,

if not actively to destroy, still to wear down and weaken the vigour of the subordinated autonomies. The consequence was that whenever the central authority was weak, the persistent principle of regional autonomy essential to the life of India reasserted itself to the detriment of the artificial unity established and not, as it should have done, for the harmonious intensification and freer but still united functioning of the total life. The imperial monarchy tended also to wear down the vigour of the free assemblies, and the result was that the communal units instead of being elements of a united strength became isolated and dividing factors. The village community preserved something of its vigour, but had no living connection with the supreme authority and, losing the larger national sense, was willing to accept any indigenous or foreign rule that respected its own self-sufficient narrow life. The religious communities came to be imbued with the same spirit. The castes, multiplying themselves without any true necessity or true relation to the spiritual or the economic need of the country, became mere sacrosanct conventional divisions, a power for isolation and not, as they originally were, factors of a harmonious functioning of the total life-synthesis. It is not true that the caste divisions were in ancient India an obstacle to the united life of the people or that they were even in later times an active power for political strife and disunion,—except indeed at the end, in the final decline, and especially during the later history of the Mahratta confederation; but they did become a passive force of social division and of a stagnant compartmentalism obstructive to the reconstitution of a free and actively united life.

The evils that attended the system did not all manifest themselves with any power before the Mahomedan invasions, but they must have been already there in their beginning and they increased rapidly under the conditions created by the Pathan and the Mogul empires. These later imperial systems however brilliant and powerful, suffered still more than their predecessors from the evils of centralisation owing to their autocratic character and were constantly breaking down from the same tendency of the regional life of India to assert itself against an artificial

unitarian regime, while, because they had no true, living and free relation with the life of the people, they proved unable to create the common patriotism which would have effectively secured them against the foreign invader. And in the end there has come a mechanical Western rule that has crushed out all the still existing communal or regional autonomies and substituted the dead unity of a machine. But again in the reaction against it we see the same ancient tendencies reviving, the tendency towards a reconstitution of the regional life of the Indian peoples, the demand for a provincial autonomy founded on true subdivisions of race and language, a harking back of the Indian mind to the ideal of the lost village community as a living unit necessary to the natural life of the national body and, not yet reborn but dimly beginning to dawn on the more advanced minds, a truer idea of the communal basis proper to Indian life and the renovation and reconstruction of Indian society and politics on a spiritual foundation.

The failure to achieve Indian unity of which the invasions and the final subjection to the foreigner were the consequence, arose therefore at once from the magnitude and from the peculiarity of the task, because the easy method of a centralised empire could not truly succeed in India, while yet it seemed the only device possible and was attempted again and again with a partial success that seemed for the time and a long time to justify it, but always with an eventual failure. I have suggested that the early mind of India better understood the essential character of the problem. The Vedic Rishis and their successors made it their chief work to found a spiritual basis of Indian life and to effect the spiritual and cultural unity of the many races and peoples of the peninsula. But they were not blind to the necessity of a political unification. Observing the constant tendency of the clan life of the Aryan peoples to consolidate under confederacies and hegemonies of varying proportions, *vairājya*, *sāmrājya*, they saw that to follow this line to its full conclusion was the right way and evolved therefore the ideal of the Chakravarti, a uniting imperial rule, uniting without destroying the autonomy of India's many kingdoms and peoples, from sea to sea. This

ideal they supported, like everything else in Indian life, with a spiritual and religious sanction, set up as its outward symbol the Aswamedha and Rajasuya sacrifices, and made it the dharma of a powerful King, his royal and religious duty, to attempt the fulfilment of the ideal. He was not allowed by the Dharma to destroy the liberties of the peoples who came under his sway nor to dethrone or annihilate their royal houses or replace their archons by his officials and governors. His function was to establish a suzerain power possessed of sufficient military strength to preserve internal peace and to combine at need the full forces of the country. And to this elementary function came to be added the ideal of the fulfilment and maintenance under a strong uniting hand of the Indian dharma, the right functioning of the spiritual, religious, ethical and social culture of India.

The full flowering of the ideal is seen in the great epics. The Mahabharata is the record of a legendary or, it may be, a historic attempt to establish such an empire, a *dharmarājya* or kingdom of the Dharma. There the ideal is pictured as so imperative and widely acknowledged that even the turbulent Shishupala is represented as motivating his submission and attendance at the Rajasuya sacrifice on the ground that Yudhisthira was carrying out an action demanded by the Dharma. And in the Ramayana we have an idealised picture of such a Dharmarajya, a settled universal empire. Here too it is not an autocratic despotism but a universal monarchy supported by a free assembly of the city and provinces and of all the classes that is held up as the ideal, an enlargement of the monarchical state synthetising the communal autonomies of the Indian system and maintaining the law and constitution of the Dharma. The ideal of conquest held up is not a destructive and predatory invasion annihilating the organic freedom and the political and social institutions and exploiting the economic resources of the conquered peoples, but a sacrificial progression bringing with it a trial of military strength of which the result was easily accepted because defeat entailed neither humiliation nor servitude and suffering but merely a strengthening adhesion to a suzerain power concerned only with establishing the visible unity of the nation and the Dharma. The

ideal of the ancient Rishis is clear and their purpose: it is evident that they saw the military and political utility and necessity of a unification of the divided and warring peoples of the land, but they saw also that it ought not to be secured at the expense of the free life of the regional peoples or of the communal liberties and not therefore by a centralised monarchy or a rigidly unitarian imperial State. A hegemony or confederacy under an imperial head would be the nearest Western analogy to the conception they sought to impose on the minds of the people.

There is no historical evidence that this ideal was ever successfully carried into execution, although the epic tradition speaks of several such empires preceding the Dharmarajya of Yudhisthira. At the time of Buddha and later when Chandragupta and Chanakya were building the first historic Indian empire, the country was still covered with free kingdoms and republics and there was no united empire to meet the great raid of Alexander. It is evident that if any hegemony had previously existed, it had failed to discover a means or system of enduring permanence. This might however have evolved if time had been given, but a serious change had meanwhile taken place which made it urgently necessary to find an immediate solution. The historic weakness of the Indian peninsula has always been until modern times its vulnerability through the north-western passes. This weakness did not exist so long as ancient India extended northward far beyond the Indus and the powerful kingdoms of Gandhara and Vahlika presented a firm bulwark against foreign invasion. But they had now gone down before the organised Persian empire and from this time forward the trans-Indus countries, ceasing to be part of India, ceased also to be its protection and became instead the secure base for every successive invader. The inroad of Alexander brought home the magnitude of the danger to the political mind of India and from this time we see poets, writers, political thinkers constantly upholding the imperial ideal or thinking out the means of its realisation. The immediate practical result was the rise of the empire founded with remarkable swiftness by the statesmanship of Chanakya and constantly maintained or restored through

eight or nine centuries, in spite of periods of weakness and incipient disintegration, successively by the Maurya, Sunga, Kanwa, Andhra and Gupta dynasties. The history of this empire, its remarkable organisation, administration, public works, opulence, magnificent culture and the vigour, the brilliance, the splendid fruitfulness of the life of the peninsula under its shelter emerges only from scattered insufficient records, but even so it ranks among the greatest constructed and maintained by the genius of the earth's great peoples. India has no reason, from this point of view, to be anything but proud of her ancient achievement in empire-building or to submit to the hasty verdict that denies to her antique civilisation a strong practical genius or high political virtue.

At the same time this empire suffered by the inevitable haste, violence and artificiality of its first construction to meet a pressing need, because that prevented it from being the deliberate, natural and steady evolution in the old solid Indian manner of the truth of her deepest ideal. The attempt to establish a centralised imperial monarchy brought with it not a free synthesis but a breaking down of regional autonomies. Although according to the Indian principle their institutes and customs were respected and at first even their political institutions not wholly annulled, at any rate in many cases, but brought within the imperial system, these could not really flourish under the shadow of the imperial centralisation. The free peoples of the ancient Indian world began to disappear, their broken materials serving afterwards to create the now existing Indian races. And I think it can be concluded on the whole that although for a long time the great popular assemblies continued to remain in vigour, their function in the end tended to become more mechanical and their vitality to decline and suffer. The urban republics too tended to become more and more mere municipalities of the organised kingdom or empire. The habits of mind created by the imperial centralisation and the weakening or disappearance of the more dignified free popular institutions of the past created a sort of spiritual gap, on one side of which were the administered content with any government that gave them security and

did not interfere too much with their religion, life and customs and on the other the imperial administration beneficent and splendid, no doubt, but no longer that living head of a free and living people contemplated by the earlier and the true political mind of India. These results became prominent and were final only with the decline, but they were there in seed and rendered almost inevitable by the adoption of a mechanical method of unification. The advantages gained were those of a stronger and more coherent military action and a more regularised and uniform administration, but these could not compensate in the end for the impairment of the free organic diversified life which was the true expression of the mind and temperament of the people.

A worse result was a certain fall from the high ideal of the Dharma. In the struggle of kingdom with kingdom for supremacy a habit of Machiavellian statecraft replaced the nobler ethical ideals of the past, aggressive ambition was left without any sufficient spiritual or moral check and there was a coarsening of the national mind in the ethics of politics and government already evidenced in the draconic penal legislation of the Maurya times and in Asoka's sanguinary conquest of Orissa. The deterioration, held in abeyance by a religious spirit and high intelligence, did not come to a head till more than a thousand years afterwards and we only see it in its full force in the worst period of the decline when unrestrained mutual aggression, the unbridled egoism of princes and leaders, a total lack of political principle and capacity for effective union, the want of a common patriotism and the traditional indifference of the common people to a change of rulers gave the whole of the vast peninsula into the grasp of a handful of merchants from across the seas. But however tardy the worst results in their coming and however redeemed and held in check at first by the political greatness of the empire and a splendid intellectual and artistic culture and by frequent spiritual revivals, India had already lost by the time of the later Guptas the chance of a natural and perfect flowering of her true mind and inmost spirit in the political life of her peoples.

Meanwhile the empire served well enough, although not perfectly, the end for which it was created, the saving of Indian soil and Indian civilisation from that immense flood of barbarian unrest which threatened all the ancient stabilised cultures and finally proved too strong for the highly developed Graeco-Roman civilisation and the vast and powerful Roman empire. That unrest throwing great masses of Teutons, Slavs, Huns and Scythians to west and east and south battered at the gates of India for many centuries, effected certain inroads, but, when it sank, left the great edifice of Indian civilisation standing and still firm, great and secure. The irruptions took place whenever the empire grew weak and this seems to have happened whenever the country was left for some time secure. The empire was weakened by the suspension of the need which created it, for then the regional spirit reawoke in separatist movements disintegrating its unity or breaking down its large extension over all the North. A fresh peril brought about the renewal of its strength under a new dynasty, but the phenomenon continued to repeat itself until, the peril ceasing for a considerable time, the empire called into existence to meet it passed away not to revive. It left behind it a certain number of great kingdoms in the east, south and centre and a more confused mass of peoples in the northwest, the weak point at which the Mussulmans broke in and in a brief period rebuilt in the north, but in another, a Central Asiatic type, the ancient empire.

These earlier foreign invasions and their effects have to be seen in their true proportions, which are often disturbed by the exaggerated theories of oriental scholars. The invasion of Alexander was an eastward impulsion of Hellenism that had a work to do in western and central Asia, but no future in India. Immediately ejected by Chandragupta, it left no traces. The entrance of the Graeco-Bactrians which took place during the weakness of the later Mauryas and was annulled by the reviving strength of the empire, was that of a Hellenised people already profoundly influenced by Indian culture. The later Parthian, Hun and Scythian invasions were of a more serious character and for a time seemed dangerous to the integrity of India. In the

end however they affected powerfully only the Punjab, although they threw their waves farther south along the western coast and dynasties of a foreign extraction may have been established for a time far down towards the south. To what degree the racial character of these parts was affected, is far from certain. Oriental scholars and ethnologists have imagined that the Punjab was Scythianised, that the Rajputs are of the same stock and that even farther south the race was changed by the intrusion. These speculations are founded upon scanty or no evidence and are contradicted by other theories, and it is highly doubtful whether the barbarian invaders could have come in such numbers as to produce so considerable a consequence. It is farther rendered improbable by the fact that in one or two or three generations the invaders were entirely Indianised, assumed completely the Indian religion, manners, customs, culture and melted into the mass of the Indian peoples. No such phenomenon took place as in the countries of the Roman empire, of barbarian tribes imposing on a superior civilisation their laws, political system, barbaric customs, alien rule. This is the common significant fact of these irruptions and it must have been due to one or all of three factors. The invaders may have been armies rather than peoples: the occupation was not a continuous external rule which had time to stiffen in its foreign character, for each was followed by a revival of the strength of the Indian empire and its return upon the conquered provinces: and finally the powerfully vital and absorbing character of Indian culture was too strong to allow of any mental resistance to assimilation in the intruders. At any rate if these irruptions were of a very considerable character, Indian civilisation must be considered to have proved itself much more sound, more vital and more solid than the younger Graeco-Roman which went down before the Teuton and the Arab or survived only underneath and in a debased form heavily barbarised, broken and unrecognisable. And the Indian empire too must be pronounced to have proved after all more efficacious than was the Roman with all its vaunt of solidity and greatness, for it succeeded, even if pierced in the west, in preserving the security of the great mass of the peninsula.

It is a later downfall, the Mussulman conquest failing in the hands of the Arabs but successfully reattempted after a long interval, and all that followed it which serves to justify the doubt thrown on the capacity of the Indian peoples. But first let us put aside certain misconceptions which cloud the real issue. This conquest took place at a time when the vitality of ancient Indian life and culture after two thousand years of activity and creation was already exhausted for a time or very near exhaustion and needed a breathing space to rejuvenate itself by transference from the Sanskrit to the popular tongues and the newly forming regional peoples. The conquest was effected rapidly enough in the north, although not entirely complete there for several centuries, but the south long preserved its freedom as of old against the earlier indigenous empire and there was not so long a distance of time between the extinction of the kingdom of Vijayanagara and the rise of the Mahrattas. The Rajputs maintained their independence until the time of Akbar and his successors and it was in the end partly with the aid of Rajput princes acting as their generals and ministers that the Moguls completed their sway over the east and the south. And this was again possible because—a fact too often forgotten—the Mussulman domination ceased very rapidly to be a foreign rule. The vast mass of the Mussulmans in the country were and are Indians by race, only a very small admixture of Pathan, Turkish and Mogul blood took place, and even the foreign kings and nobles became almost immediately wholly Indian in mind, life and interest. If the race had really like certain European countries remained for many centuries passive, acquiescent and impotent under an alien sway, that would indeed have been a proof of a great inherent weakness; but the British is the first really continuous foreign rule that has dominated India. The ancient civilisation underwent indeed an eclipse and decline under the weight of a Central Asiatic religion and culture with which it failed to coalesce, but it survived its pressure, put its impact on it in many directions and remained to our own day alive even in decadence and capable of recovery, thus giving a proof of strength and soundness rare in the history of human cultures.

And in the political field it never ceased to throw up great rulers, statesmen, soldiers, administrators. Its political genius was not in the decadence sufficient, not coherent enough or swift in vision and action, to withstand the Pathan, Mogul and European, but it was strong to survive and await every opportunity of revival, made a bid for empire under Rana Sanga, created the great kingdom of Vijayanagara, held its own for centuries against Islam in the hills of Rajputana, and in its worst days still built and maintained against the whole power of the ablest of the Moguls the kingdom of Shivaji, formed the Mahratta confederacy and the Sikh Khalsa, undermined the great Mogul structure and again made a last attempt at empire. On the brink of the final and almost fatal collapse in the midst of unspeakable darkness, disunion and confusion it could still produce Ranjit Singh and Nana Fadnavis and Madhoji Scindia and oppose the inevitable march of England's destiny. These facts do not diminish the weight of the charge that can be made of an incapacity to see and solve the central problem and answer the one persistent question of Fate, but considered as the phenomena of a decadence they make a sufficiently remarkable record not easily paralleled under similar circumstances and certainly put a different complexion on the total question than the crude statement that India has been always subject and politically incapable.

The real problem introduced by the Mussulman conquest was not that of subjection to a foreign rule and the ability to recover freedom, but the struggle between two civilisations, one ancient and indigenous, the other mediaeval and brought in from outside. That which rendered the problem insoluble was the attachment of each to a powerful religion, the one militant and aggressive, the other spiritually tolerant indeed and flexible, but obstinately faithful in its discipline to its own principle and standing on the defence behind a barrier of social forms. There were two conceivable solutions, the rise of a greater spiritual principle and formation which could reconcile the two or a political patriotism surmounting the religious struggle and uniting the two communities. The first was impossible in that age. Akbar attempted it on the Mussulman side, but his religion

was an intellectual and political rather than a spiritual creation and had never any chance of assent from the strongly religious mind of the two communities. Nanak attempted it from the Hindu side, but his religion, universal in principle, became a sect in practice. Akbar attempted also to create a common political patriotism, but this endeavour too was foredoomed to failure. An autocratic empire built on the Central Asian principle could not create the desired spirit by calling in the administrative ability of the two communities in the person of great men and princes and nobles to a common service in the creation of a united imperial India: the living assent of the people was needed and that remained passive for want of awakening political ideals and institutions. The Mogul empire was a great and magnificent construction and an immense amount of political genius and talent was employed in its creation and maintenance. It was as splendid, powerful and beneficent and, it may be added, in spite of Aurangzeb's fanatical zeal, infinitely more liberal and tolerant in religion than any mediaeval or contemporary European kingdom or empire and India under its rule stood high in military and political strength, economic opulence and the brilliance of its art and culture. But it failed like the empires before it, more disastrously even, and in the same way, crumbling not by external attack but by internal disintegration. A military and administrative centralised empire could not effect India's living political unity. And although a new life seemed about to rise in the regional peoples, the chance was cut short by the intrusion of the European nations and their seizure of the opportunity created by the failure of the Peshwas and the desperate confusion of the succeeding anarchy and decadence.

Two remarkable creations embodied in the period of disintegration the last effort of the Indian political mind to form the foundations of a new life under the old conditions, but neither proved to be of a kind that could solve the problem. The Mahratta revival inspired by Ramdas's conception of the Maharashtra Dharma and cast into shape by Shivaji was an attempt to restore what could still be understood or remembered of the ancient form and spirit, but it failed, as all attempts to

revive the past must fail, in spite of the spiritual impetus and the democratic forces that assisted its inception. The Peshwas for all their genius lacked the vision of the founder and could only establish a military and political confederacy. And their endeavour to found an empire could not succeed because it was inspired by a regional patriotism that failed to enlarge itself beyond its own limits and awaken to the living ideal of a united India. The Sikh Khalsa on the other hand was an astonishingly original and novel creation and its face was turned not to the past but the future. Apart and singular in its theocratic head and democratic soul and structure, its profound spiritual beginning, its first attempt to combine the deepest elements of Islam and Vedanta, it was a premature drive towards an entrance into the third or spiritual stage of human society, but it could not create between the spirit and the external life the transmitting medium of a rich creative thought and culture. And thus hampered and deficient it began and ended within narrow local limits, achieved intensity but no power of expansion. The conditions were not then in existence that could have made possible a successful endeavour.

Afterwards came the night and a temporary end of all political initiative and creation. The lifeless attempt of the last generation to imitate and reproduce with a servile fidelity the ideals and forms of the West has been no true indication of the political mind and genius of the Indian people. But again amid all the mist of confusion there is still the possibility of a new twilight, not of an evening but a morning Yuga-sandhya. India of the ages is not dead nor has she spoken her last creative word; she lives and has still something to do for herself and the human peoples. And that which must seek now to awake is not an anglicised oriental people, docile pupil of the West and doomed to repeat the cycle of the Occident's success and failure, but still the ancient immemorable Shakti recovering her deepest self, lifting her head higher towards the supreme source of light and strength and turning to discover the complete meaning and a vaster form of her Dharma.

Note on the Texts

Note on the Texts

The thirty-two essays that make up this volume were first published in the monthly journal *Arya* between August 1918 and January 1921. Each essay was written immediately before its publication.

The Renaissance in India. Four essays appeared in the *Arya* between August and November 1918 under the title *The Renaissance in India*. In September 1920 they were published under the same title by the Prabartak Publishing House, Chandernagore, after being revised lightly by Sri Aurobindo. The publisher's note to this edition stated: "The subject matter of the book was written in a way of appreciation of Mr. James H. Cousins' book of the same name." Cousins' *Renaissance in India*, a series of articles on contemporary Indian art and other subjects, was published by Ganesh & Co., Madras, with a preface dated June 1918. New editions of Sri Aurobindo's *Renaissance in India* were published in 1927, 1937, 1946, 1951 and 1966. The 1966 edition has been frequently reprinted. In 1971 and 1972 *The Renaissance in India* was published along with *The Foundations of Indian Culture* (see below) as volume 14 of the Sri Aurobindo Birth Centenary Library (de luxe and popular editions).

Indian Culture and External Influence. This essay, published in March 1919, was written in answer to a comment in the Bengali journal *Narayan* on Sri Aurobindo's series, *The Renaissance in India*. In 1953 the essay was included in *The Foundations of Indian Culture* as an appendix.

"Is India Civilised?" Three essays appeared in the *Arya* under this title between December 1918 and February 1919. They were written in response to a book by Sir John Woodroffe entitled *Is India Civilized? Essays on Indian Culture* (Madras: Ganesh & Co., foreword dated 4 October 1918). Woodroffe's book was itself a response to a book by

William Archer, *India and the Future* (London: Hutchinson & Co., 1917).

A Defence of Indian Culture. In the issue of the *Arya* in which he concluded “*Is India Civilised?*”, Sri Aurobindo began another series dealing in more detail with William Archer’s criticisms of Indian culture, taken to represent a typical Western attitude at that time. Six essays were published under the title “A Rationalistic Critic on Indian Culture” between February and July 1919. In the August 1919 issue of the *Arya* the title “A Defence of Indian Culture” appeared for the first time with this note: “As these articles have extended beyond their original intention, a more suitable title is substituted for the original heading.” The next eighteen articles appeared under the new title. The twenty-four instalments of the series were numbered I-XXIV (actually XXIII due to an error). The series was discontinued with the termination of the *Arya* in January 1921.

Revision of “Is India Civilised?” and A Defence of Indian Culture. Sometime in the 1920s or 1930s Sri Aurobindo revised the three instalments of “*Is India Civilised?*” and the first eight and a half instalments of *A Defence of Indian Culture* (including the six entitled “A Rationalistic Critic on Indian Culture”). When the eight essays on art and polity referred to in the next paragraph were republished in 1947, Sri Aurobindo revised them slightly. He also made a few changes to the essays on literature. The rest of *A Defence of Indian Culture* was not revised.

Separate booklets. In February 1947 the four instalments on Indian art from *A Defence of Indian Culture* were published by Sri Aurobindo Circle, Bombay, under the title *The Significance of Indian Art*. New editions of this booklet were published in 1953 and 1964. In 1947, sometime after February, the four instalments on Indian polity were published by the Arya Publishing House, Calcutta, under the title *The Spirit and Form of Indian Polity*. A new edition of this booklet was brought out in 1966. The publisher’s note to *The Significance of Indian Art*, seen and approved by Sri Aurobindo, is reproduced below in full:

These chapters have been abstracted from Sri Aurobindo’s work left unfinished in the *Arya*,—*A Defence of Indian*

Culture (1918-1921). This was undertaken as a reply to a considerable work by Mr. William Archer criticising and attacking Indian civilisation and culture in all its domains: at that time this critic's views were typical of a very general attitude of the European mind towards the Indian civilisation and its special character, forms and creations and to combat the self-depreciation awakened in the Indian mind by this hostile impact and to explain to it the meaning of its own civilisation and past achievements was the main object of Sri Aurobindo. Since then, there has been a radical change and Mr. Archer's strictures and the answer to them might have been omitted and only the positive part of the work retained in this publication but there is a historical interest in the comparison or contrast drawn and otherwise also it may still have its value. The four chapters have therefore been reprinted in their entirety.

In 1949, a year before Sri Aurobindo's passing, he was asked about the possibility of bringing out the whole of *A Defence of Indian Culture*. At this time, in a statement reproduced in the Publisher's Note to the present volume, he indicated that he did not feel that the book as it then stood was ready for publication.

The Foundations of Indian Culture. In 1953 the three essays of "Is India Civilised?", the twenty-four chapters making up *A Defence of Indian Culture* and, as an appendix, *Indian Culture and External Influence* (but not *The Renaissance in India*) were published by The Sri Aurobindo Library, New York, as *The Foundations of Indian Culture*. This title was provided by the editors of the volume. The editors divided the last eighteen chapters of *A Defence* into four sections for which they provided headings: "Religion and Spirituality", "Indian Art", "Indian Literature", "Indian Polity". The same material identically arranged was published under the same title by the Sri Aurobindo Ashram, Pondicherry, in 1959. A new edition of this book was brought out in 1968. *The Foundations of Indian Culture* and *The Renaissance in India* were published together in 1971 and 1972 as the de luxe and popular editions of volume 14 of the Sri Aurobindo Birth Centenary Library. The SABCL edition of *The Foundations*, without *The Renaissance*,

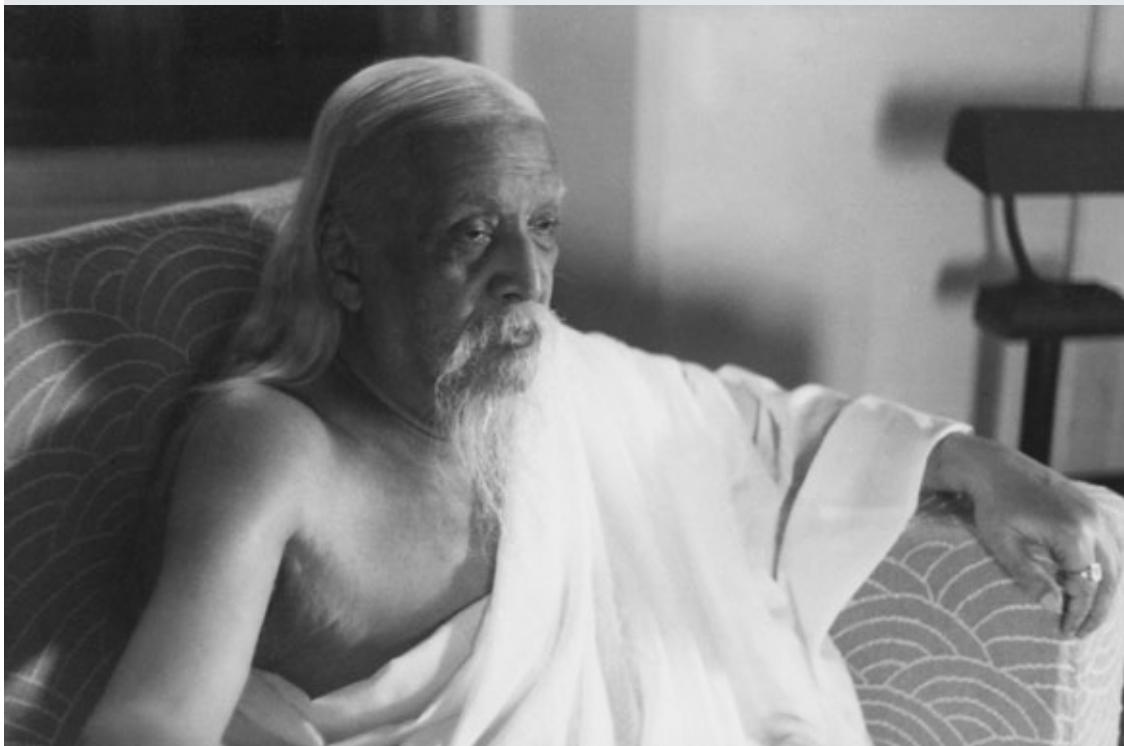

was reprinted in reduced facsimile in 1975 and five more times between 1980 and 1995.

The present edition. This volume contains, under another title and in a different order, the same writings as volume 14 of the Sri Aurobindo Birth Centenary Library. The book is now published as *The Renaissance in India with A Defence of Indian Culture*, using the titles Sri Aurobindo himself gave to the two principal sets of essays. *The Renaissance in India* formed the starting-point and was the only series brought out as a book during Sri Aurobindo's lifetime. Its title has been given priority over that of the longer but unfinished series, *A Defence of Indian Culture*. "Is India Civilised?" and *Indian Culture and External Influence* have been put in their appropriate places. With the exception of the last-named piece, the essays appear in the order in which they were published in the *Arya*. The present editors have kept the original sequential numbering of the twenty-four essays of *A Defence of Indian Culture*. In addition they have retained the *Arya* heading "A Rationalistic Critic on Indian Culture" for the first six chapters. They have also used the headings given in 1953 to the four editorial divisions of the remainder of the work, with one change, the replacement of "Religion and Spirituality" by "Indian Spirituality and Life".

The editors have carefully checked the text of each of the essays against the *Arya* text and, where appropriate, the revised versions.

The Life Divine

Publisher's Note

The Life Divine first appeared serially in the monthly review *Arya* between August 1914 and January 1919. Each instalment was written immediately before its publication. In 1939 and 1940 Sri Aurobindo revised *The Life Divine* for book publication. The first volume of the revised version, consisting of the first twenty-seven chapters of the *Arya* text, along with a newly written twenty-eighth chapter, was published in November 1939. The revision of all but two of the *Arya* chapters was light. The second volume of the revised version was published in July 1940. The revision of this volume was extensive. Eight *Arya* chapters were discarded and seventeen considerably revised, while twelve new chapters were written. Volume I was reprinted in 1943 and 1947, Volume II in 1944. A one-volume edition was brought out in the United States in 1949. New editions were published in India in 1955, 1970 and 2001, and in the United States in 1990. The editions of 1970 and 1990 were reprinted many times.

The present edition has been checked against all editions published before 1950 and, when necessary, the author's manuscripts.

CONTENTS

Book One **Omnipresent Reality and the Universe**

Chapter I	
The Human Aspiration	3
Chapter II	
The Two Negations	
1. The Materialist Denial	8
Chapter III	
The Two Negations	
2. The Refusal of the Ascetic	20
Chapter IV	
Reality Omnipresent	29
Chapter V	
The Destiny of the Individual	38
Chapter VI	
Man in the Universe	47
Chapter VII	
The Ego and the Dualities	56
Chapter VIII	
The Methods of Vedantic Knowledge	66
Chapter IX	
The Pure Existential	78
Chapter X	
Conscious Force	87
Chapter XI	
Delight of Existence: The Problem	98
Chapter XII	
Delight of Existence: The Solution	108
Chapter XIII	
The Divine Maya	120

CONTENTS

Chapter XIV	
The Supermind as Creator	130
Chapter XV	
The Supreme Truth-Consciousness	141

A page of Arya, revised by Sir Aurobindo

Book One
Omnipresent Reality
and the Universe

Chapter I

The Human Aspiration

She follows to the goal of those that are passing on beyond,
she is the first in the eternal succession of the dawns that are
coming,—Usha widens bringing out that which lives, awak-
ening someone who was dead. . . . What is her scope when
she harmonises with the dawns that shone out before and
those that now must shine? She desires the ancient mornings
and fulfils their light; projecting forwards her illumination she
enters into communion with the rest that are to come.

Kutsa Angirasa — Rig Veda.¹

Threefold are those supreme births of this divine force that is
in the world, they are true, they are desirable; he moves there
wide-overt within the Infinite and shines pure, luminous and
fulfilling. . . . That which is immortal in mortals and possessed
of the truth, is a god and established inwardly as an energy
working out in our divine powers. . . . Become high-uplifted,
O Strength, pierce all veils, manifest in us the things of the
Godhead.

Vamadeva — Rig Veda.²

THE EARLIEST preoccupation of man in his awakened thoughts and, as it seems, his inevitable and ultimate preoccupation,—for it survives the longest periods of scepticism and returns after every banishment,—is also the highest which his thought can envisage. It manifests itself in the divination of Godhead, the impulse towards perfection, the search after pure Truth and unmixed Bliss, the sense of a secret immortality. The ancient dawns of human knowledge have left us their witness to this constant aspiration; today we see

¹ I. 113. 8, 10.

² IV. 1. 7; IV. 2. 1; IV. 4. 5.

a humanity satiated but not satisfied by victorious analysis of the externalities of Nature preparing to return to its primeval longings. The earliest formula of Wisdom promises to be its last, — God, Light, Freedom, Immortality.

These persistent ideals of the race are at once the contradiction of its normal experience and the affirmation of higher and deeper experiences which are abnormal to humanity and only to be attained, in their organised entirety, by a revolutionary individual effort or an evolutionary general progression. To know, possess and be the divine being in an animal and egoistic consciousness, to convert our twilit or obscure physical mentality into the plenary supramental illumination, to build peace and a self-existent bliss where there is only a stress of transitory satisfactions besieged by physical pain and emotional suffering, to establish an infinite freedom in a world which presents itself as a group of mechanical necessities, to discover and realise the immortal life in a body subjected to death and constant mutation, — this is offered to us as the manifestation of God in Matter and the goal of Nature in her terrestrial evolution. To the ordinary material intellect which takes its present organisation of consciousness for the limit of its possibilities, the direct contradiction of the unrealised ideals with the realised fact is a final argument against their validity. But if we take a more deliberate view of the world's workings, that direct opposition appears rather as part of Nature's profoundest method and the seal of her completest sanction.

For all problems of existence are essentially problems of harmony. They arise from the perception of an unsolved discord and the instinct of an undiscovered agreement or unity. To rest content with an unsolved discord is possible for the practical and more animal part of man, but impossible for his fully awakened mind, and usually even his practical parts only escape from the general necessity either by shutting out the problem or by accepting a rough, utilitarian and unilluminated compromise. For essentially, all Nature seeks a harmony, life and matter in their own sphere as much as mind in the arrangement of its perceptions. The greater the apparent disorder of the materials offered

or the apparent disparateness, even to irreconcilable opposition, of the elements that have to be utilised, the stronger is the spur, and it drives towards a more subtle and puissant order than can normally be the result of a less difficult endeavour. The accordance of active Life with a material of form in which the condition of activity itself seems to be inertia, is one problem of opposites that Nature has solved and seeks always to solve better with greater complexities; for its perfect solution would be the material immortality of a fully organised mind-supporting animal body. The accordance of conscious mind and conscious will with a form and a life in themselves not overtly self-conscious and capable at best of a mechanical or subconscious will is another problem of opposites in which she has produced astonishing results and aims always at higher marvels; for there her ultimate miracle would be an animal consciousness no longer seeking but possessed of Truth and Light, with the practical omnipotence which would result from the possession of a direct and perfected knowledge. Not only, then, is the upward impulse of man towards the accordance of yet higher opposites rational in itself, but it is the only logical completion of a rule and an effort that seem to be a fundamental method of Nature and the very sense of her universal strivings.

We speak of the evolution of Life in Matter, the evolution of Mind in Matter; but evolution is a word which merely states the phenomenon without explaining it. For there seems to be no reason why Life should evolve out of material elements or Mind out of living form, unless we accept the Vedantic solution that Life is already involved in Matter and Mind in Life because in essence Matter is a form of veiled Life, Life a form of veiled Consciousness. And then there seems to be little objection to a farther step in the series and the admission that mental consciousness may itself be only a form and a veil of higher states which are beyond Mind. In that case, the unconquerable impulse of man towards God, Light, Bliss, Freedom, Immortality presents itself in its right place in the chain as simply the imperative impulse by which Nature is seeking to evolve beyond Mind, and appears to be as natural, true and just as the impulse towards Life

which she has planted in certain forms of Matter or the impulse towards Mind which she has planted in certain forms of Life. As there, so here, the impulse exists more or less obscurely in her different vessels with an ever-ascending series in the power of its will-to-be; as there, so here, it is gradually evolving and bound fully to evolve the necessary organs and faculties. As the impulse towards Mind ranges from the more sensitive reactions of Life in the metal and the plant up to its full organisation in man, so in man himself there is the same ascending series, the preparation, if nothing more, of a higher and divine life. The animal is a living laboratory in which Nature has, it is said, worked out man. Man himself may well be a thinking and living laboratory in whom and with whose conscious co-operation she wills to work out the superman, the god. Or shall we not say, rather, to manifest God? For if evolution is the progressive manifestation by Nature of that which slept or worked in her, involved, it is also the overt realisation of that which she secretly is. We cannot, then, bid her pause at a given stage of her evolution, nor have we the right to condemn with the religionist as perverse and presumptuous or with the rationalist as a disease or hallucination any intention she may evince or effort she may make to go beyond. If it be true that Spirit is involved in Matter and apparent Nature is secret God, then the manifestation of the divine in himself and the realisation of God within and without are the highest and most legitimate aim possible to man upon earth.

Thus the eternal paradox and eternal truth of a divine life in an animal body, an immortal aspiration or reality inhabiting a mortal tenement, a single and universal consciousness representing itself in limited minds and divided egos, a transcendent, indefinable, timeless and spaceless Being who alone renders time and space and cosmos possible, and in all these the higher truth realisable by the lower term, justify themselves to the deliberate reason as well as to the persistent instinct or intuition of mankind. Attempts are sometimes made to have done finally with questionings which have so often been declared insoluble by logical thought and to persuade men to limit their mental activities to the practical and immediate problems of their

material existence in the universe; but such evasions are never permanent in their effect. Mankind returns from them with a more vehement impulse of inquiry or a more violent hunger for an immediate solution. By that hunger mysticism profits and new religions arise to replace the old that have been destroyed or stripped of significance by a scepticism which itself could not satisfy because, although its business was inquiry, it was unwilling sufficiently to inquire. The attempt to deny or stifle a truth because it is yet obscure in its outward workings and too often represented by obscurantist superstition or a crude faith, is itself a kind of obscurantism. The will to escape from a cosmic necessity because it is arduous, difficult to justify by immediate tangible results, slow in regulating its operations, must turn out eventually to have been no acceptance of the truth of Nature but a revolt against the secret, mightier will of the great Mother. It is better and more rational to accept what she will not allow us as a race to reject and lift it from the sphere of blind instinct, obscure intuition and random aspiration into the light of reason and an instructed and consciously self-guiding will. And if there is any higher light of illumined intuition or self-revealing truth which is now in man either obstructed and inoperative or works with intermittent glancings as if from behind a veil or with occasional displays as of the northern lights in our material skies, then there also we need not fear to aspire. For it is likely that such is the next higher state of consciousness of which Mind is only a form and veil, and through the splendours of that light may lie the path of our progressive self-enlargement into whatever highest state is humanity's ultimate resting-place.

Chapter II

The Two Negations

1

The Materialist Denial

He energised conscious-force (in the austerity of thought) and came to the knowledge that Matter is the Brahman. For from Matter all existences are born; born, by Matter they increase and enter into Matter in their passing hence. Then he went to Varuna, his father, and said, "Lord, teach me of the Brahman." But he said to him: "Energise (again) the conscious-energy in thee; for the Energy is Brahman." *Taittiriya Upanishad.*¹

THE AFFIRMATION of a divine life upon earth and an immortal sense in mortal existence can have no base unless we recognise not only eternal Spirit as the inhabitant of this bodily mansion, the wearer of this mutable robe, but accept Matter of which it is made, as a fit and noble material out of which He weaves constantly His garbs, builds recurrently the unending series of His mansions.

Nor is this, even, enough to guard us against a recoil from life in the body unless, with the Upanishads, perceiving behind their appearances the identity in essence of these two extreme terms of existence, we are able to say in the very language of those ancient writings, "Matter also is Brahman", and to give its full value to the vigorous figure by which the physical universe is described as the external body of the Divine Being. Nor,—so far divided apparently are these two extreme terms,—is that identification convincing to the rational intellect if we refuse to

¹ III. I, 2.

recognise a series of ascending terms (Life, Mind, Supermind and the grades that link Mind to Supermind) between Spirit and Matter. Otherwise the two must appear as irreconcilable opponents bound together in an unhappy wedlock and their divorce the one reasonable solution. To identify them, to represent each in the terms of the other, becomes an artificial creation of Thought opposed to the logic of facts and possible only by an irrational mysticism.

If we assert only pure Spirit and a mechanical unintelligent substance or energy, calling one God or Soul and the other Nature, the inevitable end will be that we shall either deny God or else turn from Nature. For both Thought and Life, a choice then becomes imperative. Thought comes to deny the one as an illusion of the imagination or the other as an illusion of the senses; Life comes to fix on the immaterial and flee from itself in a disgust or a self-forgetting ecstasy, or else to deny its own immortality and take its orientation away from God and towards the animal. Purusha and Prakriti, the passively luminous Soul of the Sankhyas and their mechanically active Energy, have nothing in common, not even their opposite modes of inertia; their antinomies can only be resolved by the cessation of the inertly driven Activity into the immutable Repose upon which it has been casting in vain the sterile procession of its images. Shankara's wordless, inactive Self and his Maya of many names and forms are equally disparate and irreconcilable entities; their rigid antagonism can terminate only by the dissolution of the multitudinous illusion into the sole Truth of an eternal Silence.

The materialist has an easier field; it is possible for him by denying Spirit to arrive at a more readily convincing simplicity of statement, a real Monism, the Monism of Matter or else of Force. But in this rigidity of statement it is impossible for him to persist permanently. He too ends by positing an unknowable as inert, as remote from the known universe as the passive Purusha or the silent Atman. It serves no purpose but to put off by a vague concession the inexorable demands of Thought or to stand as an excuse for refusing to extend the limits of inquiry.

Therefore, in these barren contradictions the human mind

cannot rest satisfied. It must seek always a complete affirmation; it can find it only by a luminous reconciliation. To reach that reconciliation it must traverse the degrees which our inner consciousness imposes on us and, whether by objective method of analysis applied to Life and Mind as to Matter or by subjective synthesis and illumination, arrive at the repose of the ultimate unity without denying the energy of the expressive multiplicity. Only in such a complete and catholic affirmation can all the multiform and apparently contradictory data of existence be harmonised and the manifold conflicting forces which govern our thought and life discover the central Truth which they are here to symbolise and variously fulfil. Then only can our Thought, having attained a true centre, ceasing to wander in circles, work like the Brahman of the Upanishad, fixed and stable even in its play and its worldwide coursing, and our life, knowing its aim, serve it with a serene and settled joy and light as well as with a rhythmically discursive energy.

But when that rhythm has once been disturbed, it is necessary and helpful that man should test separately, in their extreme assertion, each of the two great opposites. It is the mind's natural way of returning more perfectly to the affirmation it has lost. On the road it may attempt to rest in the intervening degrees, reducing all things into the terms of an original Life-Energy or of sensation or of Ideas; but these exclusive solutions have always an air of unreality. They may satisfy for a time the logical reason which deals only with pure ideas, but they cannot satisfy the mind's sense of actuality. For the mind knows that there is something behind itself which is not the Idea; it knows, on the other hand, that there is something within itself which is more than the vital Breath. Either Spirit or Matter can give it for a time some sense of ultimate reality; not so any of the principles that intervene. It must, therefore, go to the two extremes before it can return fruitfully upon the whole. For by its very nature, served by a sense that can perceive with distinctness only the parts of existence and by a speech that, also, can achieve distinctness only when it carefully divides and limits, the intellect is driven, having before it this multiplicity of elemental principles, to seek unity by

reducing all ruthlessly to the terms of one. It attempts practically, in order to assert this one, to get rid of the others. To perceive the real source of their identity without this exclusive process, it must either have overleaped itself or must have completed the circuit only to find that all equally reduce themselves to That which escapes definition or description and is yet not only real but attainable. By whatever road we may travel, That is always the end at which we arrive and we can only escape it by refusing to complete the journey.

It is therefore of good augury that after many experiments and verbal solutions we should now find ourselves standing today in the presence of the two that have alone borne for long the most rigorous tests of experience, the two extremes, and that at the end of the experience both should have come to a result which the universal instinct in mankind, that veiled judge, sentinel and representative of the universal Spirit of Truth, refuses to accept as right or as satisfying. In Europe and in India, respectively, the negation of the materialist and the refusal of the ascetic have sought to assert themselves as the sole truth and to dominate the conception of Life. In India, if the result has been a great heaping up of the treasures of the Spirit,—or of some of them,—it has also been a great bankruptcy of Life; in Europe, the fullness of riches and the triumphant mastery of this world's powers and possessions have progressed towards an equal bankruptcy in the things of the Spirit. Nor has the intellect, which sought the solution of all problems in the one term of Matter, found satisfaction in the answer that it has received.

Therefore the time grows ripe and the tendency of the world moves towards a new and comprehensive affirmation in thought and in inner and outer experience and to its corollary, a new and rich self-fulfilment in an integral human existence for the individual and for the race.

From the difference in the relations of Spirit and Matter to the Unknowable which they both represent, there arises also a difference of effectiveness in the material and the spiritual negations. The denial of the materialist although more insistent and immediately successful, more facile in its appeal to the generality

of mankind, is yet less enduring, less effective finally than the absorbing and perilous refusal of the ascetic. For it carries within itself its own cure. Its most powerful element is the Agnosticism which, admitting the Unknowable behind all manifestation, extends the limits of the unknowable until it comprehends all that is merely unknown. Its premiss is that the physical senses are our sole means of Knowledge and that Reason, therefore, even in its most extended and vigorous flights, cannot escape beyond their domain; it must deal always and solely with the facts which they provide or suggest; and the suggestions themselves must always be kept tied to their origins; we cannot go beyond, we cannot use them as a bridge leading us into a domain where more powerful and less limited faculties come into play and another kind of inquiry has to be instituted.

A premiss so arbitrary pronounces on itself its own sentence of insufficiency. It can only be maintained by ignoring or explaining away all that vast field of evidence and experience which contradicts it, denying or disparaging noble and useful faculties, active consciously or obscurely or at worst latent in all human beings, and refusing to investigate supraphysical phenomena except as manifested in relation to matter and its movements and conceived as a subordinate activity of material forces. As soon as we begin to investigate the operations of mind and of supermind, in themselves and without the prejudgment that is determined from the beginning to see in them only a subordinate term of Matter, we come into contact with a mass of phenomena which escape entirely from the rigid hold, the limiting dogmatism of the materialist formula. And the moment we recognise, as our enlarging experience compels us to recognise, that there are in the universe knowable realities beyond the range of the senses and in man powers and faculties which determine rather than are determined by the material organs through which they hold themselves in touch with the world of the senses,—that outer shell of our true and complete existence,—the premiss of materialistic Agnosticism disappears. We are ready for a large statement and an ever-developing inquiry.

But, first, it is well that we should recognise the enormous,

the indispensable utility of the very brief period of rationalistic Materialism through which humanity has been passing. For that vast field of evidence and experience which now begins to reopen its gates to us, can only be safely entered when the intellect has been severely trained to a clear austerity; seized on by unripe minds, it lends itself to the most perilous distortions and misleading imaginations and actually in the past encrusted a real nucleus of truth with such an accretion of perverting superstitions and irrationalising dogmas that all advance in true knowledge was rendered impossible. It became necessary for a time to make a clean sweep at once of the truth and its disguise in order that the road might be clear for a new departure and a surer advance. The rationalistic tendency of Materialism has done mankind this great service.

For the faculties that transcend the senses, by the very fact of their being immeshed in Matter, missioned to work in a physical body, put in harness to draw one car along with the emotional desires and nervous impulses, are exposed to a mixed functioning in which they are in danger of illuminating confusion rather than clarifying truth. Especially is this mixed functioning dangerous when men with unchastened minds and unpurified sensibilities attempt to rise into the higher domains of spiritual experience. In what regions of unsubstantial cloud and semi-brilliant fog or a murk visited by flashes which blind more than they enlighten, do they not lose themselves by that rash and premature adventure! An adventure necessary indeed in the way in which Nature chooses to effect her advance,—for she amuses herself as she works,—but still, for the Reason, rash and premature.

It is necessary, therefore, that advancing Knowledge should base herself on a clear, pure and disciplined intellect. It is necessary, too, that she should correct her errors sometimes by a return to the restraint of sensible fact, the concrete realities of the physical world. The touch of Earth is always reinvigorating to the son of Earth, even when he seeks a supraphysical Knowledge. It may even be said that the supraphysical can only be really mastered in its fullness — to its heights we can always

reach — when we keep our feet firmly on the physical. “Earth is His footing,”² says the Upanishad whenever it images the Self that manifests in the universe. And it is certainly the fact that the wider we extend and the surer we make our knowledge of the physical world, the wider and surer becomes our foundation for the higher knowledge, even for the highest, even for the Brahavidya.

In emerging, therefore, out of the materialistic period of human Knowledge we must be careful that we do not rashly condemn what we are leaving or throw away even one tittle of its gains, before we can summon perceptions and powers that are well grasped and secure, to occupy their place. Rather we shall observe with respect and wonder the work that Atheism has done for the Divine and admire the services that Agnosticism has rendered in preparing the illimitable increase of knowledge. In our world error is continually the handmaid and pathfinder of Truth; for error is really a half-truth that stumbles because of its limitations; often it is Truth that wears a disguise in order to arrive unobserved near to its goal. Well, if it could always be, as it has been in the great period we are leaving, the faithful handmaid, severe, conscientious, clean-handed, luminous within its limits, a half-truth and not a reckless and presumptuous aberration.

A certain kind of Agnosticism is the final truth of all knowledge. For when we come to the end of whatever path, the universe appears as only a symbol or an appearance of an unknowable Reality which translates itself here into different systems of values, physical values, vital and sensational values, intellectual, ideal and spiritual values. The more That becomes real to us, the more it is seen to be always beyond defining thought and beyond formulating expression. “Mind attains not there, nor speech.”³ And yet as it is possible to exaggerate, with the Illusionists, the unreality of the appearance, so it is possible

² “Padbhyaṁ pṛthivī.” — Mundaka Upanishad, II. 1. 4.

“Pṛthivī pājasyam.” — Brihadaranyaka Upanishad, I. 1. 1.

³ Kena Upanishad, I. 3.

to exaggerate the unknowableness of the Unknowable. When we speak of It as unknowable, we mean, really, that It escapes the grasp of our thought and speech, instruments which proceed always by the sense of difference and express by the way of definition; but if not knowable by thought, It is attainable by a supreme effort of consciousness. There is even a kind of Knowledge which is one with Identity and by which, in a sense, It can be known. Certainly, that Knowledge cannot be reproduced successfully in the terms of thought and speech, but when we have attained to it, the result is a revaluation of That in the symbols of our cosmic consciousness, not only in one but in all the ranges of symbols, which results in a revolution of our internal being and, through the internal, of our external life. Moreover, there is also a kind of Knowledge through which That does reveal itself by all these names and forms of phenomenal existence which to the ordinary intelligence only conceal It. It is this higher but not highest process of Knowledge to which we can attain by passing the limits of the materialistic formula and scrutinising Life, Mind and Supermind in the phenomena that are characteristic of them and not merely in those subordinate movements by which they link themselves to Matter.

The Unknown is not the Unknowable;⁴ it need not remain the unknown for us, unless we choose ignorance or persist in our first limitations. For to all things that are not unknowable, all things in the universe, there correspond in that universe faculties which can take cognisance of them, and in man, the microcosm, these faculties are always existent and at a certain stage capable of development. We may choose not to develop them; where they are partially developed, we may discourage and impose on them a kind of atrophy. But, fundamentally, all possible knowledge is knowledge within the power of humanity. And since in man there is the inalienable impulse of Nature towards self-realisation, no struggle of the intellect to limit the action of our capacities within a determined area can for ever prevail.

⁴ Other is That than the Known; also it is above the Unknown.

— *Kena Upanishad*, I. 3.

When we have proved Matter and realised its secret capacities, the very knowledge which has found its convenience in that temporary limitation, must cry to us, like the Vedic Restrainers, “Forth now and push forward also in other fields.”⁵

If modern Materialism were simply an unintelligent acquiescence in the material life, the advance might be indefinitely delayed. But since its very soul is the search for Knowledge, it will be unable to cry a halt; as it reaches the barriers of sense-knowledge and of the reasoning from sense-knowledge, its very rush will carry it beyond and the rapidity and sureness with which it has embraced the visible universe is only an earnest of the energy and success which we may hope to see repeated in the conquest of what lies beyond, once the stride is taken that crosses the barrier. We see already that advance in its obscure beginnings.

Not only in the one final conception, but in the great line of its general results Knowledge, by whatever path it is followed, tends to become one. Nothing can be more remarkable and suggestive than the extent to which modern Science confirms in the domain of Matter the conceptions and even the very formulae of language which were arrived at, by a very different method, in the Vedanta,—the original Vedanta, not of the schools of metaphysical philosophy, but of the Upanishads. And these, on the other hand, often reveal their full significance, their richer contents only when they are viewed in the new light shed by the discoveries of modern Science,—for instance, that Vedantic expression which describes things in the Cosmos as one seed arranged by the universal Energy in multitudinous forms.⁶ Significant, especially, is the drive of Science towards a Monism which is consistent with multiplicity, towards the Vedic idea of the one essence with its many becomings. Even if the dualistic appearance of Matter and Force be insisted on, it does not really stand in the way of this Monism. For it will be evident that essential Matter is a thing non-existent to the senses and only, like the

⁵ *Rig Veda*, I. 4. 5.

⁶ *Svetasvatara Upanishad*, VI. 12.

Pradhana of the Sankhyas, a conceptual form of substance; and in fact the point is increasingly reached where only an arbitrary distinction in thought divides form of substance from form of energy.

Matter expresses itself eventually as a formulation of some unknown Force. Life, too, that yet unfathomed mystery, begins to reveal itself as an obscure energy of sensibility imprisoned in its material formulation; and when the dividing ignorance is cured which gives us the sense of a gulf between Life and Matter, it is difficult to suppose that Mind, Life and Matter will be found to be anything else than one Energy triply formulated, the triple world of the Vedic seers. Nor will the conception then be able to endure of a brute material Force as the mother of Mind. The Energy that creates the world can be nothing else than a Will, and Will is only consciousness applying itself to a work and a result.

What is that work and result, if not a self-involution of Consciousness in form and a self-evolution out of form so as to actualise some mighty possibility in the universe which it has created? And what is its will in Man if not a will to unending Life, to unbounded Knowledge, to unfettered Power? Science itself begins to dream of the physical conquest of death, expresses an insatiable thirst for knowledge, is working out something like a terrestrial omnipotence for humanity. Space and Time are contracting to the vanishing-point in its works, and it strives in a hundred ways to make man the master of circumstance and so lighten the fetters of causality. The idea of limit, of the impossible begins to grow a little shadowy and it appears instead that whatever man constantly wills, he must in the end be able to do; for the consciousness in the race eventually finds the means. It is not in the individual that this omnipotence expresses itself, but the collective Will of mankind that works out with the individual as a means. And yet when we look more deeply, it is not any conscious Will of the collectivity, but a superconscious Might that uses the individual as a centre and means, the collectivity as a condition and field. What is this but the God in man, the infinite Identity, the multitudinous Unity,

the Omniscient, the Omnipotent, who having made man in His own image, with the ego as a centre of working, with the race, the collective Narayana,⁷ the *viśvamānava*⁸ as the mould and circumscription, seeks to express in them some image of the unity, omniscience, omnipotence which are the self-conception of the Divine? “That which is immortal in mortals is a God and established inwardly as an energy working out in our divine powers.”⁹ It is this vast cosmic impulse which the modern world, without quite knowing its own aim, yet serves in all its activities and labours subconsciously to fulfil.

But there is always a limit and an encumbrance,—the limit of the material field in the Knowledge, the encumbrance of the material machinery in the Power. But here also the latest trend is highly significant of a freer future. As the outposts of scientific Knowledge come more and more to be set on the borders that divide the material from the immaterial, so also the highest achievements of practical Science are those which tend to simplify and reduce to the vanishing-point the machinery by which the greatest effects are produced. Wireless telegraphy is Nature’s exterior sign and pretext for a new orientation. The sensible physical means for the intermediate transmission of the physical force is removed; it is only preserved at the points of impulsion and reception. Eventually even these must disappear; for when the laws and forces of the supraphysical are studied with the right starting-point, the means will infallibly be found for Mind directly to seize on the physical energy and speed it accurately upon its errand. There, once we bring ourselves to recognise it, lie the gates that open upon the enormous vistas of the future.

Yet even if we had full knowledge and control of the worlds immediately above Matter, there would still be a limitation and still a beyond. The last knot of our bondage is at that point where the external draws into oneness with the internal, the

⁷ A name of Vishnu, who, as the God in man, lives constantly associated in a dual unity with Nara, the human being.

⁸ The universal man.

⁹ *Rig Veda*, IV. 2. 1.

machinery of ego itself becomes subtilised to the vanishing-point and the law of our action is at last unity embracing and possessing multiplicity and no longer, as now, multiplicity struggling towards some figure of unity. There is the central throne of cosmic Knowledge looking out on her widest dominion; there the empire of oneself with the empire of one's world;¹⁰ there the life¹¹ in the eternally consummate Being and the realisation of His divine nature¹² in our human existence.

¹⁰ *Svārājya* and *sāmrājya*, the double aim proposed to itself by the positive Yoga of the ancients.

¹¹ *Sālokya-mukti*, liberation by conscious existence in one world of being with the Divine.

¹² *Sādharmya-mukti*, liberation by assumption of the Divine Nature.

Chapter III

The Two Negations

2

The Refusal of the Ascetic

All this is the Brahman; this Self is the Brahman and the Self is fourfold.

Beyond relation, featureless, unthinkable, in which all is still.
Mandukya Upanishad.¹

AND STILL there is a beyond. For on the other side of the cosmic consciousness there is, attainable to us, a consciousness yet more transcendent,—transcendent not only of the ego, but of the Cosmos itself,—against which the universe seems to stand out like a petty picture against an immeasurable background. That supports the universal activity,—or perhaps only tolerates it; It embraces Life with Its vastness,—or else rejects it from Its infinitude.

If the materialist is justified from his point of view in insisting on Matter as reality, the relative world as the sole thing of which we can in some sort be sure and the Beyond as wholly unknowable, if not indeed non-existent, a dream of the mind, an abstraction of Thought divorcing itself from reality, so also is the Sannyasin, enamoured of that Beyond, justified from his point of view in insisting on pure Spirit as the reality, the one thing free from change, birth, death, and the relative as a creation of the mind and the senses, a dream, an abstraction in

¹ Verses 2, 7.

the contrary sense of Mentality withdrawing from the pure and eternal Knowledge.

What justification, of logic or of experience, can be asserted in support of the one extreme which cannot be met by an equally cogent logic and an equally valid experience at the other end? The world of Matter is affirmed by the experience of the physical senses which, because they are themselves unable to perceive anything immaterial or not organised as gross Matter, would persuade us that the suprasensible is the unreal. This vulgar or rustic error of our corporeal organs does not gain in validity by being promoted into the domain of philosophical reasoning. Obviously, their pretension is unfounded. Even in the world of Matter there are existences of which the physical senses are incapable of taking cognisance. Yet the denial of the suprasensible as necessarily an illusion or a hallucination depends on this constant sensuous association of the real with the materially perceptible, which is itself a hallucination. Assuming throughout what it seeks to establish, it has the vice of the argument in a circle and can have no validity for an impartial reasoning.

Not only are there physical realities which are suprasensible, but, if evidence and experience are at all a test of truth, there are also senses which are supraphysical² and can not only take cognisance of the realities of the material world without the aid of the corporeal sense-organs, but can bring us into contact with other realities, supraphysical and belonging to another world— included, that is to say, in an organisation of conscious experiences that are dependent on some other principle than the gross Matter of which our suns and earths seem to be made.

Constantly asserted by human experience and belief since the origins of thought, this truth, now that the necessity of an exclusive preoccupation with the secrets of the material world no longer exists, begins to be justified by new-born forms of scientific research. The increasing evidences, of which only the most obvious and outward are established under the name of

² *Sūkṣma indriyas*, subtle organs, existing in the subtle body (*sūkṣma deha*), and the means of subtle vision and experience (*sūkṣma drṣṭi*).

telepathy with its cognate phenomena, cannot long be resisted except by minds shut up in the brilliant shell of the past, by intellects limited in spite of their acuteness through the limitation of their field of experience and inquiry, or by those who confuse enlightenment and reason with the faithful repetition of the formulas left to us from a bygone century and the jealous conservation of dead or dying intellectual dogmas.

It is true that the glimpse of supraphysical realities acquired by methodical research has been imperfect and is yet ill-affirmed; for the methods used are still crude and defective. But these rediscovered subtle senses have at least been found to be true witnesses to physical facts beyond the range of the corporeal organs. There is no justification, then, for scouting them as false witnesses when they testify to supraphysical facts beyond the domain of the material organisation of consciousness. Like all evidence, like the evidence of the physical senses themselves, their testimony has to be controlled, scrutinised and arranged by the reason, rightly translated and rightly related, and their field, laws and processes determined. But the truth of great ranges of experience whose objects exist in a more subtle substance and are perceived by more subtle instruments than those of gross physical Matter, claims in the end the same validity as the truth of the material universe. The worlds beyond exist: they have their universal rhythm, their grand lines and formations, their self-existent laws and mighty energies, their just and luminous means of knowledge. And here on our physical existence and in our physical body they exercise their influences; here also they organise their means of manifestation and commission their messengers and their witnesses.

But the worlds are only frames for our experience, the senses only instruments of experience and conveniences. Consciousness is the great underlying fact, the universal witness for whom the world is a field, the senses instruments. To that witness the worlds and their objects appeal for their reality and for the one world or the many, for the physical equally with the supraphysical we have no other evidence that they exist. It has been argued that this is no relation peculiar to the constitution

of humanity and its outlook upon an objective world, but the very nature of existence itself; all phenomenal existence consists of an observing consciousness and an active objectivity, and the Action cannot proceed without the Witness because the universe exists only in or for the consciousness that observes and has no independent reality. It has been argued in reply that the material universe enjoys an eternal self-existence: it was here before life and mind made their appearance; it will survive after they have disappeared and no longer trouble with their transient strivings and limited thoughts the eternal and inconscient rhythm of the suns. The difference, so metaphysical in appearance, is yet of the utmost practical import, for it determines the whole outlook of man upon life, the goal that he shall assign for his efforts and the field in which he shall circumscribe his energies. For it raises the question of the reality of cosmic existence and, more important still, the question of the value of human life.

If we push the materialist conclusion far enough, we arrive at an insignificance and unreality in the life of the individual and the race which leaves us, logically, the option between either a feverish effort of the individual to snatch what he may from a transient existence, to "live his life", as it is said, or a dispassionate and objectless service of the race and the individual, knowing well that the latter is a transient fiction of the nervous mentality and the former only a little more long-lived collective form of the same regular nervous spasm of Matter. We work or enjoy under the impulsion of a material energy which deceives us with the brief delusion of life or with the nobler delusion of an ethical aim and a mental consummation. Materialism like spiritual Monism arrives at a Maya that is and yet is not,—is, for it is present and compelling, is not, for it is phenomenal and transitory in its works. At the other end, if we stress too much the unreality of the objective world, we arrive by a different road at similar but still more trenchant conclusions,—the fictitious character of the individual ego, the unreality and purposelessness of human existence, the return into the Non-Being or the relationless Absolute as the sole rational escape from the meaningless tangle of phenomenal life.

And yet the question cannot be solved by logic arguing on the data of our ordinary physical existence; for in those data there is always a hiatus of experience which renders all argument inconclusive. We have, normally, neither any definitive experience of a cosmic mind or supermind not bound up with the life of the individual body, nor, on the other hand, any firm limit of experience which would justify us in supposing that our subjective self really depends upon the physical frame and can neither survive it nor enlarge itself beyond the individual body. Only by an extension of the field of our consciousness or an un hoped-for increase in our instruments of knowledge can the ancient quarrel be decided.

The extension of our consciousness, to be satisfying, must necessarily be an inner enlargement from the individual into the cosmic existence. For the Witness, if he exists, is not the individual embodied mind born in the world, but that cosmic Consciousness embracing the universe and appearing as an immanent Intelligence in all its works to which either world subsists eternally and really as Its own active existence or else from which it is born and into which it disappears by an act of knowledge or by an act of conscious power. Not organised mind, but that which, calm and eternal, broods equally in the living earth and the living human body and to which mind and senses are dispensable instruments, is the Witness of cosmic existence and its Lord.

The possibility of a cosmic consciousness in humanity is coming slowly to be admitted in modern Psychology, like the possibility of more elastic instruments of knowledge, although still classified, even when its value and power are admitted, as a hallucination. In the psychology of the East it has always been recognised as a reality and the aim of our subjective progress. The essence of the passage over to this goal is the exceeding of the limits imposed on us by the ego-sense and at least a partaking, at most an identification with the self-knowledge which broods secret in all life and in all that seems to us inanimate.

Entering into that Consciousness, we may continue to dwell, like It, upon universal existence. Then we become aware,—

for all our terms of consciousness and even our sensational experience begin to change,—of Matter as one existence and of bodies as its formations in which the one existence separates itself physically in the single body from itself in all others and again by physical means establishes communication between these multitudinous points of its being. Mind we experience similarly, and Life also, as the same existence one in its multiplicity, separating and reuniting itself in each domain by means appropriate to that movement. And, if we choose, we can proceed farther and, after passing through many linking stages, become aware of a supermind whose universal operation is the key to all lesser activities. Nor do we become merely conscious of this cosmic existence, but likewise conscious in it, receiving it in sensation, but also entering into it in awareness. In it we live as we lived before in the ego-sense, active, more and more in contact, even unified more and more with other minds, other lives, other bodies than the organism we call ourselves, producing effects not only on our own moral and mental being and on the subjective being of others, but even on the physical world and its events by means nearer to the divine than those possible to our egoistic capacity.

Real then to the man who has had contact with it or lives in it, is this cosmic consciousness, with a greater than the physical reality; real in itself, real in its effects and works. And as it is thus real to the world which is its own total expression, so is the world real to it; but not as an independent existence. For in that higher and less hampered experience we perceive that consciousness and being are not different from each other, but all being is a supreme consciousness, all consciousness is self-existence, eternal in itself, real in its works and neither a dream nor an evolution. The world is real precisely because it exists only in consciousness; for it is a Conscious Energy one with Being that creates it. It is the existence of material form in its own right apart from the self-illuminated energy which assumes the form, that would be a contradiction of the truth of things, a phantasmagoria, a nightmare, an impossible falsehood.

But this conscious Being which is the truth of the infinite

supermind, is more than the universe and lives independently in Its own inexpressible infinity as well as in the cosmic harmonies. World lives by That; That does not live by the world. And as we can enter into the cosmic consciousness and be one with all cosmic existence, so we can enter into the world-transcending consciousness and become superior to all cosmic existence. And then arises the question which first occurred to us, whether this transcendence is necessarily also a rejection. What relation has this universe to the Beyond?

For at the gates of the Transcendent stands that mere and perfect Spirit described in the Upanishads, luminous, pure, sustaining the world but inactive in it, without sinews of energy, without flaw of duality, without scar of division, unique, identical, free from all appearance of relation and of multiplicity, — the pure Self of the Adwaitins,³ the inactive Brahman, the transcendent Silence. And the mind when it passes those gates suddenly, without intermediate transitions, receives a sense of the unreality of the world and the sole reality of the Silence which is one of the most powerful and convincing experiences of which the human mind is capable. Here, in the perception of this pure Self or of the Non-Being behind it, we have the starting-point for a second negation, — parallel at the other pole to the materialistic, but more complete, more final, more perilous in its effects on the individuals or collectivities that hear its potent call to the wilderness, — the refusal of the ascetic.

It is this revolt of Spirit against Matter that for two thousand years, since Buddhism disturbed the balance of the old Aryan world, has dominated increasingly the Indian mind. Not that the sense of the cosmic illusion is the whole of Indian thought; there are other philosophical statements, other religious aspirations. Nor has some attempt at an adjustment between the two terms been wanting even from the most extreme philosophies. But all have lived in the shadow of the great Refusal and the final end of life for all is the garb of the ascetic. The general conception of existence has been permeated with the Buddhistic theory of the

³ The Vedantic Monists.

chain of Karma and with the consequent antinomy of bondage and liberation, bondage by birth, liberation by cessation from birth. Therefore all voices are joined in one great consensus that not in this world of the dualities can there be our kingdom of heaven, but beyond, whether in the joys of the eternal Vrindavan⁴ or the high beatitude of Brahmaloka,⁵ beyond all manifestations in some ineffable Nirvana⁶ or where all separate experience is lost in the featureless unity of the indefinable Existence. And through many centuries a great army of shining witnesses, saints and teachers, names sacred to Indian memory and dominant in Indian imagination, have borne always the same witness and swelled always the same lofty and distant appeal,—renunciation the sole path of knowledge, acceptance of physical life the act of the ignorant, cessation from birth the right use of human birth, the call of the Spirit, the recoil from Matter.

For an age out of sympathy with the ascetic spirit—and throughout all the rest of the world the hour of the Anchorite may seem to have passed or to be passing—it is easy to attribute this great trend to the failing of vital energy in an ancient race tired out by its burden, its once vast share in the common advance, exhausted by its many-sided contribution to the sum of human effort and human knowledge. But we have seen that it corresponds to a truth of existence, a state of conscious realisation which stands at the very summit of our possibility. In practice also the ascetic spirit is an indispensable element in human perfection and even its separate affirmation cannot be avoided so long as the race has not at the other end liberated its intellect and its vital habits from subjection to an always insistent animalism.

We seek indeed a larger and completer affirmation. We perceive that in the Indian ascetic ideal the great Vedantic formula,

⁴ *Goloka*, the Vaishnava heaven of eternal Beauty and Bliss.

⁵ The highest state of pure existence, consciousness and beatitude attainable by the soul without complete extinction in the Indefinable.

⁶ Extinction, not necessarily of all being, but of being as we know it; extinction of ego, desire and egoistic action and mentality.

“One without a second”, has not been read sufficiently in the light of that other formula equally imperative, “All this is the Brahman”. The passionate aspiration of man upward to the Divine has not been sufficiently related to the descending movement of the Divine leaning downward to embrace eternally Its manifestation. Its meaning in Matter has not been so well understood as Its truth in the Spirit. The Reality which the Sannyasin seeks has been grasped in its full height, but not, as by the ancient Vedantins, in its full extent and comprehensiveness. But in our completer affirmation we must not minimise the part of the pure spiritual impulse. As we have seen how greatly Materialism has served the ends of the Divine, so we must acknowledge the still greater service rendered by Asceticism to Life. We shall preserve the truths of material Science and its real utilities in the final harmony, even if many or even if all of its existing forms have to be broken or left aside. An even greater scruple of right preservation must guide us in our dealing with the legacy, however actually diminished or depreciated, of the Aryan past.

Chapter IV

Reality Omnipresent

If one knows Him as Brahman the Non-Being, he becomes merely the non-existent. If one knows that Brahman Is, then is he known as the real in existence. *Taittiriya Upanishad.*¹

SINCE, then, we admit both the claim of the pure Spirit to manifest in us its absolute freedom and the claim of universal Matter to be the mould and condition of our manifestation, we have to find a truth that can entirely reconcile these antagonists and can give to both their due portion in Life and their due justification in Thought, amercing neither of its rights, denying in neither the sovereign truth from which even its errors, even the exclusiveness of its exaggerations draw so constant a strength. For wherever there is an extreme statement that makes such a powerful appeal to the human mind, we may be sure that we are standing in the presence of no mere error, superstition or hallucination, but of some sovereign fact disguised which demands our fealty and will avenge itself if denied or excluded. Herein lies the difficulty of a satisfying solution and the source of that lack of finality which pursues all mere compromises between Spirit and Matter. A compromise is a bargain, a transaction of interests between two conflicting powers; it is not a true reconciliation. True reconciliation proceeds always by a mutual comprehension leading to some sort of intimate oneness. It is therefore through the utmost possible unification of Spirit and Matter that we shall best arrive at their reconciling truth and so at some strongest foundation for a reconciling practice in the inner life of the individual and his outer existence.

We have found already in the cosmic consciousness a

¹ II. 6.

meeting-place where Matter becomes real to Spirit, Spirit becomes real to Matter. For in the cosmic consciousness Mind and Life are intermediaries and no longer, as they seem in the ordinary egoistic mentality, agents of separation, fomenters of an artificial quarrel between the positive and negative principles of the same unknowable Reality. Attaining to the cosmic consciousness Mind, illuminated by a knowledge that perceives at once the truth of Unity and the truth of Multiplicity and seizes on the formulae of their interaction, finds its own discords at once explained and reconciled by the divine Harmony; satisfied, it consents to become the agent of that supreme union between God and Life towards which we tend. Matter reveals itself to the realising thought and to the subtilised senses as the figure and body of Spirit,—Spirit in its self-formative extension. Spirit reveals itself through the same consenting agents as the soul, the truth, the essence of Matter. Both admit and confess each other as divine, real and essentially one. Mind and Life are disclosed in that illumination as at once figures and instruments of the supreme Conscious Being by which It extends and houses Itself in material form and in that form unveils Itself to Its multiple centres of consciousness. Mind attains its self-fulfilment when it becomes a pure mirror of the Truth of Being which expresses itself in the symbols of the universe; Life, when it consciously lends its energies to the perfect self-figuration of the Divine in ever-new forms and activities of the universal existence.

In the light of this conception we can perceive the possibility of a divine life for man in the world which will at once justify Science by disclosing a living sense and intelligible aim for the cosmic and the terrestrial evolution and realise by the transfiguration of the human soul into the divine the great ideal dream of all high religions.

But what then of that silent Self, inactive, pure, self-existent, self-enjoying, which presented itself to us as the abiding justification of the ascetic? Here also harmony and not irreconcilable opposition must be the illuminative truth. The silent and the active Brahman are not different, opposite and irreconcilable entities, the one denying, the other affirming a cosmic illusion;

they are one Brahman in two aspects, positive and negative, and each is necessary to the other. It is out of this Silence that the Word which creates the worlds for ever proceeds; for the Word expresses that which is self-hidden in the Silence. It is an eternal passivity which makes possible the perfect freedom and omnipotence of an eternal divine activity in innumerable cosmic systems. For the becomings of that activity derive their energies and their illimitable potency of variation and harmony from the impartial support of the immutable Being, its consent to this infinite fecundity of its own dynamic Nature.

Man, too, becomes perfect only when he has found within himself that absolute calm and passivity of the Brahman and supports by it with the same divine tolerance and the same divine bliss a free and inexhaustible activity. Those who have thus possessed the Calm within can perceive always welling out from its silence the perennial supply of the energies that work in the universe. It is not, therefore, the truth of the Silence to say that it is in its nature a rejection of the cosmic activity. The apparent incompatibility of the two states is an error of the limited Mind which, accustomed to trenchant oppositions of affirmation and denial and passing suddenly from one pole to the other, is unable to conceive of a comprehensive consciousness vast and strong enough to include both in a simultaneous embrace. The Silence does not reject the world; it sustains it. Or rather it supports with an equal impartiality the activity and the withdrawal from the activity and approves also the reconciliation by which the soul remains free and still even while it lends itself to all action.

But, still, there is the absolute withdrawal, there is the Non-Being. Out of the Non-Being, says the ancient Scripture, Being appeared.² Then into the Non-Being it must surely sink again. If the infinite indiscriminate Existence permits all possibilities of discrimination and multiple realisation, does not the Non-Being at least, as primal state and sole constant reality, negate and reject all possibility of a real universe? The Nihil of certain

² In the beginning all this was the Non-Being. It was thence that Being was born.
— *Taittiriya Upanishad*, II. 7.

Buddhist schools would then be the true ascetic solution; the Self, like the ego, would be only an ideative formation by an illusory phenomenal consciousness.

But again we find that we are being misled by words, deceived by the trenchant oppositions of our limited mentality with its fond reliance on verbal distinctions as if they perfectly represented ultimate truths and its rendering of our supramental experiences in the sense of those intolerant distinctions. Non-Being is only a word. When we examine the fact it represents, we can no longer be sure that absolute non-existence has any better chance than the infinite Self of being more than an ideative formation of the mind. We really mean by this Nothing something beyond the last term to which we can reduce our purest conception and our most abstract or subtle experience of actual being as we know or conceive it while in this universe. This Nothing then is merely a something beyond positive conception. We erect a fiction of nothingness in order to overpass, by the method of total exclusion, all that we can know and consciously are. Actually when we examine closely the Nihil of certain philosophies, we begin to perceive that it is a zero which is All or an indefinable Infinite which appears to the mind a blank, because mind grasps only finite constructions, but is in fact the only true Existence.³

And when we say that out of Non-Being Being appeared, we perceive that we are speaking in terms of Time about that which is beyond Time. For what was that portentous date in the history of eternal Nothing on which Being was born out of it or when will come that other date equally formidable on which an unreal all will relapse into the perpetual void? Sat and Asat, if they have both to be affirmed, must be conceived as if they

³ Another Upanishad rejects the birth of being out of Non-Being as an impossibility; Being, it says, can only be born from Being. But if we take Non-Being in the sense, not of an inexistent Nihil but of an *x* which exceeds our idea or experience of existence,—a sense applicable to the Absolute Brahman of the Adwaita as well as the Void or Zero of the Buddhists,—the impossibility disappears, for That may very well be the source of being, whether by a conceptual or formative Maya or a manifestation or creation out of itself.

obtained simultaneously. They permit each other even though they refuse to mingle. Both, since we must speak in terms of Time, are eternal. And who shall persuade eternal Being that it does not really exist and only eternal Non-Being is? In such a negation of all experience how shall we find the solution that explains all experience?

Pure Being is the affirmation by the Unknowable of Itself as the free base of all cosmic existence. We give the name of Non-Being to a contrary affirmation of Its freedom from all cosmic existence,—freedom, that is to say, from all positive terms of actual existence which consciousness in the universe can formulate to itself, even from the most abstract, even from the most transcendent. It does not deny them as a real expression of Itself, but It denies Its limitation by all expression or any expression whatsoever. The Non-Being permits the Being, even as the Silence permits the Activity. By this simultaneous negation and affirmation, not mutually destructive, but complementary to each other like all contraries, the simultaneous awareness of conscious Self-being as a reality and the Unknowable beyond as the same Reality becomes realisable to the awakened human soul. Thus was it possible for the Buddha to attain the state of Nirvana and yet act puissantly in the world, impersonal in his inner consciousness, in his action the most powerful personality that we know of as having lived and produced results upon earth.

When we ponder on these things, we begin to perceive how feeble in their self-assertive violence and how confusing in their misleading distinctness are the words that we use. We begin also to perceive that the limitations we impose on the Brahman arise from a narrowness of experience in the individual mind which concentrates itself on one aspect of the Unknowable and proceeds forthwith to deny or disparage all the rest. We tend always to translate too rigidly what we can conceive or know of the Absolute into the terms of our own particular relativity. We affirm the One and Identical by passionately discriminating and asserting the egoism of our own opinions and partial experiences against the opinions and partial experiences of others. It is wiser

to wait, to learn, to grow, and, since we are obliged for the sake of our self-perfection to speak of these things which no human speech can express, to search for the widest, the most flexible, the most catholic affirmation possible and found on it the largest and most comprehensive harmony.

We recognise, then, that it is possible for the consciousness in the individual to enter into a state in which relative existence appears to be dissolved and even Self seems to be an inadequate conception. It is possible to pass into a Silence beyond the Silence. But this is not the whole of our ultimate experience, nor the single and all-excluding truth. For we find that this Nirvana, this self-extinction, while it gives an absolute peace and freedom to the soul within is yet consistent in practice with a desireless but effective action without. This possibility of an entire motionless impersonality and void Calm within doing outwardly the works of the eternal verities, Love, Truth and Righteousness, was perhaps the real gist of the Buddha's teaching,— this superiority to ego and to the chain of personal workings and to the identification with mutable form and idea, not the petty ideal of an escape from the trouble and suffering of the physical birth. In any case, as the perfect man would combine in himself the silence and the activity, so also would the completely conscious soul reach back to the absolute freedom of the Non-Being without therefore losing its hold on Existence and the universe. It would thus reproduce in itself perpetually the eternal miracle of the divine Existence, in the universe, yet always beyond it and even, as it were, beyond itself. The opposite experience could only be a concentration of mentality in the individual upon Non-existence with the result of an oblivion and personal withdrawal from a cosmic activity still and always proceeding in the consciousness of the Eternal Being.

Thus, after reconciling Spirit and Matter in the cosmic consciousness, we perceive the reconciliation, in the transcendental consciousness, of the final assertion of all and its negation. We discover that all affirmations are assertions of status or activity in the Unknowable; all the corresponding negations are assertions of Its freedom both from and in that status or activity.

The Unknowable is Something to us supreme, wonderful and ineffable which continually formulates Itself to our consciousness and continually escapes from the formulation It has made. This it does not as some malicious spirit or freakish magician leading us from falsehood to greater falsehood and so to a final negation of all things, but as even here the Wise beyond our wisdom guiding us from reality to ever profounder and vaster reality until we find the profoundest and vastest of which we are capable. An omnipresent reality is the Brahman, not an omnipresent cause of persistent illusions.

If we thus accept a positive basis for our harmony — and on what other can harmony be founded? — the various conceptual formulations of the Unknowable, each of them representing a truth beyond conception, must be understood as far as possible in their relation to each other and in their effect upon life, not separately, not exclusively, not so affirmed as to destroy or unduly diminish all other affirmations. The real Monism, the true Adwaita, is that which admits all things as the one Brahman and does not seek to bisect Its existence into two incompatible entities, an eternal Truth and an eternal Falsehood, Brahman and not-Brahman, Self and not-Self, a real Self and an unreal, yet perpetual Maya. If it be true that the Self alone exists, it must be also true that all is the Self. And if this Self, God or Brahman is no helpless state, no bounded power, no limited personality, but the self-conscious All, there must be some good and inherent reason in it for the manifestation, to discover which we must proceed on the hypothesis of some potency, some wisdom, some truth of being in all that is manifested. The discord and apparent evil of the world must in their sphere be admitted, but not accepted as our conquerors. The deepest instinct of humanity seeks always and seeks wisely wisdom as the last word of the universal manifestation, not an eternal mockery and illusion, — a secret and finally triumphant good, not an all-creative and invincible evil, — an ultimate victory and fulfilment, not the disappointed recoil of the soul from its great adventure.

For we cannot suppose that the sole Entity is compelled by something outside or other than Itself, since no such thing exists.

Nor can we suppose that It submits unwillingly to something partial within Itself which is hostile to its whole Being, denied by It and yet too strong for It; for this would be only to erect in other language the same contradiction of an All and something other than the All. Even if we say that the universe exists merely because the Self in its absolute impartiality tolerates all things alike, viewing with indifference all actualities and all possibilities, yet is there something that wills the manifestation and supports it, and this cannot be something other than the All. Brahman is indivisible in all things and whatever is willed in the world has been ultimately willed by the Brahman. It is only our relative consciousness, alarmed or baffled by the phenomena of evil, ignorance and pain in the cosmos, that seeks to deliver the Brahman from responsibility for Itself and its workings by erecting some opposite principle, Maya or Mara, conscious Devil or self-existent principle of evil. There is one Lord and Self and the many are only His representations and becomings.

If then the world is a dream or an illusion or a mistake, it is a dream originated and willed by the Self in its totality and not only originated and willed, but supported and perpetually entertained. Moreover, it is a dream existing in a Reality and the stuff of which it is made is that Reality, for Brahman must be the material of the world as well as its base and continent. If the gold of which the vessel is made is real, how shall we suppose that the vessel itself is a mirage? We see that these words, dream, illusion, are tricks of speech, habits of our relative consciousness; they represent a certain truth, even a great truth, but they also misrepresent it. Just as Non-Being turns out to be other than mere nullity, so the cosmic Dream turns out to be other than mere phantasm and hallucination of the mind. Phenomenon is not phantasm; phenomenon is the substantial form of a Truth.

We start, then, with the conception of an omnipresent Reality of which neither the Non-Being at the one end nor the universe at the other are negations that annul; they are rather different states of the Reality, obverse and reverse affirmations. The highest experience of this Reality in the universe shows it to be not only a conscious Existence, but a supreme Intelligence and

Force and a self-existent Bliss; and beyond the universe it is still some other unknowable existence, some utter and ineffable Bliss. Therefore we are justified in supposing that even the dualities of the universe, when interpreted not as now by our sensational and partial conceptions, but by our liberated intelligence and experience, will be also resolved into those highest terms. While we still labour under the stress of the dualities, this perception must no doubt constantly support itself on an act of faith, but a faith which the highest Reason, the widest and most patient reflection do not deny, but rather affirm. This creed is given, indeed, to humanity to support it on its journey, until it arrives at a stage of development when faith will be turned into knowledge and perfect experience and Wisdom will be justified of her works.

Chapter V

The Destiny of the Individual

By the Ignorance they cross beyond Death and by the Knowledge enjoy Immortality. . . . By the Non-Birth they cross beyond Death and by the Birth enjoy Immortality.

*Isha Upanishad.*¹

AN OMNIPRESENT Reality is the truth of all life and existence whether absolute or relative, whether corporeal or incorporeal, whether animate or inanimate, whether intelligent or unintelligent; and in all its infinitely varying and even constantly opposed self-expressions, from the contradictions nearest to our ordinary experience to those remotest antinomies which lose themselves on the verges of the Ineffable, the Reality is one and not a sum or concourse. From that all variations begin, in that all variations consist, to that all variations return. All affirmations are denied only to lead to a wider affirmation of the same Reality. All antinomies confront each other in order to recognise one Truth in their opposed aspects and embrace by the way of conflict their mutual Unity. Brahman is the Alpha and the Omega. Brahman is the One besides whom there is nothing else existent.

But this unity is in its nature indefinable. When we seek to envisage it by the mind we are compelled to proceed through an infinite series of conceptions and experiences. And yet in the end we are obliged to negate our largest conceptions, our most comprehensive experiences in order to affirm that the Reality exceeds all definitions. We arrive at the formula of the Indian sages, *neti neti*, “It is not this, It is not that”, there is no experience by which we can limit It, there is no conception by which It can be defined.

¹ Verses 11, 14.

An Unknowable which appears to us in many states and attributes of being, in many forms of consciousness, in many activities of energy, this is what Mind can ultimately say about the existence which we ourselves are and which we see in all that is presented to our thought and senses. It is in and through those states, those forms, those activities that we have to approach and know the Unknowable. But if in our haste to arrive at a Unity that our mind can seize and hold, if in our insistence to confine the Infinite in our embrace we identify the Reality with any one definable state of being however pure and eternal, with any particular attribute however general and comprehensive, with any fixed formulation of consciousness however vast in its scope, with any energy or activity however boundless its application, and if we exclude all the rest, then our thoughts sin against Its unknowability and arrive not at a true unity but at a division of the Indivisible.

So strongly was this truth perceived in the ancient times that the Vedantic Seers, even after they had arrived at the crowning idea, the convincing experience of Sachchidananda as the highest positive expression of the Reality to our consciousness, erected in their speculations or went on in their perceptions to an Asat, a Non-Being beyond, which is not the ultimate existence, the pure consciousness, the infinite bliss of which all our experiences are the expression or the deformation. If at all an existence, a consciousness, a bliss, it is beyond the highest and purest positive form of these things that here we can possess and other therefore than what here we know by these names. Buddhism, somewhat arbitrarily declared by the theologians to be an un-Vedic doctrine because it rejected the authority of the Scriptures, yet goes back to this essentially Vedantic conception. Only, the positive and synthetic teaching of the Upanishads beheld Sat and Asat not as opposites destructive of each other, but as the last antinomy through which we look up to the Unknowable. And in the transactions of our positive consciousness, even Unity has to make its account with Multiplicity; for the Many also are Brahman. It is by Vidya, the Knowledge of the Oneness, that we know God; without it Avidya, the relative and multiple consciousness, is a

night of darkness and a disorder of Ignorance. Yet if we exclude the field of that Ignorance, if we get rid of Avidya as if it were a thing non-existent and unreal, then Knowledge itself becomes a sort of obscurity and a source of imperfection. We become as men blinded by a light so that we can no longer see the field which that light illuminates.

Such is the teaching, calm, wise and clear, of our most ancient sages. They had the patience and the strength to find and to know; they had also the clarity and humility to admit the limitation of our knowledge. They perceived the borders where it has to pass into something beyond itself. It was a later impatience of heart and mind, vehement attraction to an ultimate bliss or high masterfulness of pure experience and trenchant intelligence which sought the One to deny the Many and because it had received the breath of the heights scorned or recoiled from the secret of the depths. But the steady eye of the ancient wisdom perceived that to know God really, it must know Him everywhere equally and without distinction, considering and valuing but not mastered by the oppositions through which He shines.

We will put aside then the trenchant distinctions of a partial logic which declares that because the One is the reality, the Many are an illusion, and because the Absolute is Sat, the one existence, the relative is Asat and non-existent. If in the Many we pursue insistently the One, it is to return with the benediction and the revelation of the One confirming itself in the Many.

We will guard ourselves also against the excessive importance that the mind attaches to particular points of view at which it arrives in its more powerful expansions and transitions. The perception of the spiritualised mind that the universe is an unreal dream can have no more absolute a value to us than the perception of the materialised mind that God and the Beyond are an illusory idea. In the one case the mind, habituated only to the evidence of the senses and associating reality with corporeal fact, is either unaccustomed to use other means of knowledge or unable to extend the notion of reality to a supraphysical experience. In the other case the same mind, passing beyond to the overwhelming experience of an incorporeal reality, simply

transfers the same inability and the same consequent sense of dream or hallucination to the experience of the senses. But we perceive also the truth that these two conceptions disfigure. It is true that for this world of form in which we are set for our self-realisation, nothing is entirely valid until it has possessed itself of our physical consciousness and manifested on the lowest levels in harmony with its manifestation on the highest summits. It is equally true that form and matter asserting themselves as a self-existent reality are an illusion of Ignorance. Form and matter can be valid only as shape and substance of manifestation for the incorporeal and immaterial. They are in their nature an act of divine consciousness, in their aim the representation of a status of the Spirit.

In other words, if Brahman has entered into form and represented Its being in material substance, it can only be to enjoy self-manifestation in the figures of relative and phenomenal consciousness. Brahman is in this world to represent Itself in the values of Life. Life exists in Brahman in order to discover Brahman in itself. Therefore man's importance in the world is that he gives to it that development of consciousness in which its transfiguration by a perfect self-discovery becomes possible. To fulfil God in life is man's manhood. He starts from the animal vitality and its activities, but a divine existence is his objective.

But as in Thought, so in Life, the true rule of self-realisation is a progressive comprehension. Brahman expresses Itself in many successive forms of consciousness, successive in their relation even if coexistent in being or coeval in Time, and Life in its self-unfolding must also rise to ever-new provinces of its own being. But if in passing from one domain to another we renounce what has already been given us from eagerness for our new attainment, if in reaching the mental life we cast away or belittle the physical life which is our basis, or if we reject the mental and physical in our attraction to the spiritual, we do not fulfil God integrally, nor satisfy the conditions of His self-manifestation. We do not become perfect, but only shift the field of our imperfection or at most attain a limited altitude. However high we may climb, even though it be to the Non-Being itself,

we climb ill if we forget our base. Not to abandon the lower to itself, but to transfigure it in the light of the higher to which we have attained, is true divinity of nature. Brahman is integral and unifies many states of consciousness at a time; we also, manifesting the nature of Brahman, should become integral and all-embracing.

Besides the recoil from the physical life, there is another exaggeration of the ascetic impulse which this ideal of an integral manifestation corrects. The nodus of Life is the relation between three general forms of consciousness, the individual, the universal and the transcendent or supracosmic. In the ordinary distribution of life's activities the individual regards himself as a separate being included in the universe and both as dependent upon that which transcends alike the universe and the individual. It is to this Transcendence that we give currently the name of God, who thus becomes to our conceptions not so much supracosmic as extra-cosmic. The belittling and degradation of both the individual and the universe is a natural consequence of this division: the cessation of both cosmos and individual by the attainment of the Transcendence would be logically its supreme conclusion.

The integral view of the unity of Brahman avoids these consequences. Just as we need not give up the bodily life to attain to the mental and spiritual, so we can arrive at a point of view where the preservation of the individual activities is no longer inconsistent with our comprehension of the cosmic consciousness or our attainment to the transcendent and supracosmic. For the World-Transcendent embraces the universe, is one with it and does not exclude it, even as the universe embraces the individual, is one with him and does not exclude him. The individual is a centre of the whole universal consciousness; the universe is a form and definition which is occupied by the entire immanence of the Formless and Indefinable.

This is always the true relation, veiled from us by our ignorance or our wrong consciousness of things. When we attain to knowledge or right consciousness, nothing essential in the eternal relation is changed, but only the inview and the outview

from the individual centre is profoundly modified and consequently also the spirit and effect of its activity. The individual is still necessary to the action of the Transcendent in the universe and that action in him does not cease to be possible by his illumination. On the contrary, since the conscious manifestation of the Transcendent in the individual is the means by which the collective, the universal is also to become conscious of itself, the continuation of the illumined individual in the action of the world is an imperative need of the world-play. If his inexorable removal through the very act of illumination is the law, then the world is condemned to remain eternally the scene of unredeemed darkness, death and suffering. And such a world can only be a ruthless ordeal or a mechanical illusion.

It is so that ascetic philosophy tends to conceive it. But individual salvation can have no real sense if existence in the cosmos is itself an illusion. In the Monistic view the individual soul is one with the Supreme, its sense of separateness an ignorance, escape from the sense of separateness and identity with the Supreme its salvation. But who then profits by this escape? Not the supreme Self, for it is supposed to be always and inalienably free, still, silent, pure. Not the world, for that remains constantly in the bondage and is not freed by the escape of any individual soul from the universal Illusion. It is the individual soul itself which effects its supreme good by escaping from the sorrow and the division into the peace and the bliss. There would seem then to be some kind of reality of the individual soul as distinct from the world and from the Supreme even in the event of freedom and illumination. But for the Illusionist the individual soul is an illusion and non-existent except in the inexplicable mystery of Maya. Therefore we arrive at the escape of an illusory non-existent soul from an illusory non-existent bondage in an illusory non-existent world as the supreme good which that non-existent soul has to pursue! For this is the last word of the Knowledge, "There is none bound, none freed, none seeking to be free." Vidya turns out to be as much a part of the Phenomenal as Avidya; Maya meets us even in our escape and laughs at the triumphant logic which seemed to cut the knot of her mystery.

These things, it is said, cannot be explained; they are the initial and insoluble miracle. They are for us a practical fact and have to be accepted. We have to escape by a confusion out of a confusion. The individual soul can only cut the knot of ego by a supreme act of egoism, an exclusive attachment to its own individual salvation which amounts to an absolute assertion of its separate existence in Maya. We are led to regard other souls as if they were figments of our mind and their salvation unimportant, our soul alone as if it were entirely real and its salvation the one thing that matters. I come to regard my personal escape from bondage as real while other souls who are equally myself remain behind in the bondage!

It is only when we put aside all irreconcilable antinomy between Self and the world that things fall into their place by a less paradoxical logic. We must accept the many-sidedness of the manifestation even while we assert the unity of the Manifested. And is not this after all the truth that pursues us wherever we cast our eyes, unless seeing we choose not to see? Is not this after all the perfectly natural and simple mystery of Conscious Being that It is bound neither by Its unity nor by Its multiplicity? It is "absolute" in the sense of being entirely free to include and arrange in Its own way all possible terms of Its self-expression. There is none bound, none freed, none seeking to be free,—for always That is a perfect freedom. It is so free that It is not even bound by Its liberty. It can play at being bound without incurring a real bondage. Its chain is a self-imposed convention, Its limitation in the ego a transitional device that It uses in order to repeat Its transcendence and universality in the scheme of the individual Brahman.

The Transcendent, the Supracosmic is absolute and free in Itself beyond Time and Space and beyond the conceptual opposites of finite and infinite. But in cosmos It uses Its liberty of self-formation, Its Maya, to make a scheme of Itself in the complementary terms of unity and multiplicity, and this multiple unity It establishes in the three conditions of the subconscious, the conscious and the superconscious. For actually we see that the Many objectivised in form in our material universe start

with a subconscious unity which expresses itself openly enough in cosmic action and cosmic substance, but of which they are not themselves superficially aware. In the conscient the ego becomes the superficial point at which the awareness of unity can emerge; but it applies its perception of unity to the form and surface action and, failing to take account of all that operates behind, fails also to realise that it is not only one in itself but one with others. This limitation of the universal "I" in the divided ego-sense constitutes our imperfect individualised personality. But when the ego transcends the personal consciousness, it begins to include and be overpowered by that which is to us superconscious; it becomes aware of the cosmic unity and enters into the Transcendent Self which here cosmos expresses by a multiple oneness.

The liberation of the individual soul is therefore the keynote of the definitive divine action; it is the primary divine necessity and the pivot on which all else turns. It is the point of Light at which the intended complete self-manifestation in the Many begins to emerge. But the liberated soul extends its perception of unity horizontally as well as vertically. Its unity with the transcendent One is incomplete without its unity with the cosmic Many. And that lateral unity translates itself by a multiplication, a reproduction of its own liberated state at other points in the Multiplicity. The divine soul reproduces itself in similar liberated souls as the animal reproduces itself in similar bodies. Therefore, whenever even a single soul is liberated, there is a tendency to an extension and even to an outburst of the same divine self-consciousness in other individual souls of our terrestrial humanity and,—who knows?—perhaps even beyond the terrestrial consciousness. Where shall we fix the limit of that extension? Is it altogether a legend which says of the Buddha that as he stood on the threshold of Nirvana, of the Non-Being, his soul turned back and took the vow never to make the irrevocable crossing so long as there was a single being upon earth undelivered from the knot of the suffering, from the bondage of the ego?

But we can attain to the highest without blotting ourselves

out from the cosmic extension. Brahman preserves always Its two terms of liberty within and of formation without, of expression and of freedom from the expression. We also, being That, can attain to the same divine self-possession. The harmony of the two tendencies is the condition of all life that aims at being really divine. Liberty pursued by exclusion of the thing exceeded leads along the path of negation to the refusal of that which God has accepted. Activity pursued by absorption in the act and the energy leads to an inferior affirmation and the denial of the Highest. But what God combines and synthetises, wherefore should man insist on divorcing? To be perfect as He is perfect is the condition of His integral attainment.

Through Avidya, the Multiplicity, lies our path out of the transitional egoistic self-expression in which death and suffering predominate; through Vidya consenting with Avidya by the perfect sense of oneness even in that multiplicity, we enjoy integrally the immortality and the beatitude. By attaining to the Unborn beyond all becoming we are liberated from this lower birth and death; by accepting the Becoming freely as the Divine, we invade mortality with the immortal beatitude and become luminous centres of its conscious self-expression in humanity.

Chapter VI

Man in the Universe

The Soul of man, a traveller, wanders in this cycle of Brahman, huge, a totality of lives, a totality of states, thinking itself different from the Impeller of the journey. Accepted by Him, it attains its goal of Immortality. *Swetasvatara Upanishad.*¹

THE PROGRESSIVE revelation of a great, a transcendent, a luminous Reality with the multitudinous relativities of this world that we see and those other worlds that we do not see as means and material, condition and field, this would seem then to be the meaning of the universe,—since meaning and aim it has and is neither a purposeless illusion nor a fortuitous accident. For the same reasoning which leads us to conclude that world-existence is not a deceptive trick of Mind, justifies equally the certainty that it is no blindly and helplessly self-existent mass of separate phenomenal existences clinging together and struggling together as best they can in their orbit through eternity, no tremendous self-creation and self-impulsion of an ignorant Force without any secret Intelligence within aware of its starting-point and its goal and guiding its process and its motion. An existence, wholly self-aware and therefore entirely master of itself, possesses the phenomenal being in which it is involved, realises itself in form, unfolds itself in the individual.

That luminous Emergence is the dawn which the Aryan forefathers worshipped. Its fulfilled perfection is that highest step of the world-pervading Vishnu which they beheld as if an eye of vision extended in the purest heavens of the Mind. For it exists already as an all-revealing and all-guiding Truth of things which watches over the world and attracts mortal man, first without

¹ I. 6.

the knowledge of his conscious mind, by the general march of Nature, but at last consciously by a progressive awakening and self-enlargement, to his divine ascension. The ascent to the divine Life is the human journey, the Work of works, the acceptable Sacrifice. This alone is man's real business in the world and the justification of his existence, without which he would be only an insect crawling among other ephemeral insects on a speck of surface mud and water which has managed to form itself amid the appalling immensities of the physical universe.

This Truth of things that has to emerge out of the phenomenal world's contradictions is declared to be an infinite Bliss and self-conscious Existence, the same everywhere, in all things, in all times and beyond Time, and aware of itself behind all these phenomena by whose intensest vibrations of activity or by whose largest totality it can never be entirely expressed or in any way limited; for it is self-existent and does not depend for its being upon its manifestations. They represent it, but do not exhaust it; point to it, but do not reveal it. It is revealed only to itself within their forms. The conscious existence involved in the form comes, as it evolves, to know itself by intuition, by self-vision, by self-experience. It becomes itself in the world by knowing itself; it knows itself by becoming itself. Thus possessed of itself inwardly, it imparts also to its forms and modes the conscious delight of Sachchidananda. This becoming of the infinite Bliss-Existence-Consciousness in mind and life and body,—for independent of them it exists eternally,—is the transfiguration intended and the utility of individual existence. Through the individual it manifests in relation even as of itself it exists in identity.

The Unknowable knowing itself as Sachchidananda is the one supreme affirmation of Vedanta; it contains all the others or on it they depend. This is the one veritable experience that remains when all appearances have been accounted for negatively by the elimination of their shapes and coverings or positively by the reduction of their names and forms to the constant truth that they contain. For fulfilment of life or for transcendence of life, and whether purity, calm and freedom in the spirit be

our aim or puissance, joy and perfection, Sachchidananda is the unknown, omnipresent, indispensable term for which the human consciousness, whether in knowledge and sentiment or in sensation and action, is eternally seeking.

The universe and the individual are the two essential appearances into which the Unknowable descends and through which it has to be approached; for other intermediate collectivities are born only of their interaction. This descent of the supreme Reality is in its nature a self-concealing; and in the descent there are successive levels, in the concealing successive veils. Necessarily, the revelation takes the form of an ascent; and necessarily also the ascent and the revelation are both progressive. For each successive level in the descent of the Divine is to man a stage in an ascension; each veil that hides the unknown God becomes for the God-lover and God-seeker an instrument of His unveiling. Out of the rhythmic slumber of material Nature unconscious of the Soul and the Idea that maintain the ordered activities of her energy even in her dumb and mighty material trance, the world struggles into the more quick, varied and disordered rhythm of Life labouring on the verges of self-consciousness. Out of Life it struggles upward into Mind in which the unit becomes awake to itself and its world, and in that awakening the universe gains the leverage it required for its supreme work, it gains self-conscious individuality. But Mind takes up the work to continue, not to complete it. It is a labourer of acute but limited intelligence who takes the confused materials offered by Life and, having improved, adapted, varied, classified according to its power, hands them over to the supreme Artist of our divine manhood. That Artist dwells in supermind; for supermind is superman. Therefore our world has yet to climb beyond Mind to a higher principle, a higher status, a higher dynamism in which universe and individual become aware of and possess that which they both are and therefore stand explained to each other, in harmony with each other, unified.

The disorders of life and mind cease by discerning the secret of a more perfect order than the physical. Matter below life and mind contains in itself the balance between a perfect poise of

tranquillity and the action of an immeasurable energy, but does not possess that which it contains. Its peace wears the dull mask of an obscure inertia, a sleep of unconsciousness or rather of a drugged and imprisoned consciousness. Driven by a force which is its real self but whose sense it cannot yet seize nor share, it has not the awakened joy of its own harmonious energies.

Life and mind awaken to the sense of this want in the form of a striving and seeking ignorance and a troubled and baffled desire which are the first steps towards self-knowledge and self-fulfilment. But where then is the kingdom of their self-fulfilling? It comes to them by the exceeding of themselves. Beyond life and mind we recover consciously in its divine truth that which the balance of material Nature grossly represented,—a tranquillity which is neither inertia nor a sealed trance of consciousness but the concentration of an absolute force and an absolute self-awareness, and an action of immeasurable energy which is at the same time an out-thrilling of ineffable bliss because its every act is the expression, not of a want and an ignorant straining, but of an absolute peace and self-mastery. In that attainment our ignorance realises the light of which it was a darkened or a partial reflection; our desires cease in the plenitude and fulfilment towards which even in their most brute material forms they were an obscure and fallen aspiration.

The universe and the individual are necessary to each other in their ascent. Always indeed they exist for each other and profit by each other. Universe is a diffusion of the divine All in infinite Space and Time, the individual its concentration within limits of Space and Time. Universe seeks in infinite extension the divine totality it feels itself to be but cannot entirely realise; for in extension existence drives at a pluralistic sum of itself which can neither be the primal nor the final unit, but only a recurring decimal without end or beginning. Therefore it creates in itself a self-conscious concentration of the All through which it can aspire. In the conscious individual Prakriti turns back to perceive Purusha, World seeks after Self; God having entirely become Nature, Nature seeks to become progressively God.

On the other hand it is by means of the universe that the

individual is impelled to realise himself. Not only is it his foundation, his means, his field, the stuff of the divine Work; but also, since the concentration of the universal Life which he is takes place within limits and is not like the intensive unity of Brahman free from all conception of bound and term, he must necessarily universalise and impersonalise himself in order to manifest the divine All which is his reality. Yet is he called upon to preserve, even when he most extends himself in universality of consciousness, a mysterious transcendent something of which his sense of personality gives him an obscure and egoistic representation. Otherwise he has missed his goal, the problem set to him has not been solved, the divine work for which he accepted birth has not been done.

The universe comes to the individual as Life,—a dynamism the entire secret of which he has to master and a mass of colliding results, a whirl of potential energies out of which he has to disengage some supreme order and some yet unrealised harmony. This is after all the real sense of man's progress. It is not merely a restatement in slightly different terms of what physical Nature has already accomplished. Nor can the ideal of human life be simply the animal repeated on a higher scale of mentality. Otherwise, any system or order which assured a tolerable well-being and a moderate mental satisfaction would have stayed our advance. The animal is satisfied with a modicum of necessity; the gods are content with their splendours. But man cannot rest permanently until he reaches some highest good. He is the greatest of living beings because he is the most discontented, because he feels most the pressure of limitations. He alone, perhaps, is capable of being seized by the divine frenzy for a remote ideal.

To the Life-Spirit, therefore, the individual in whom its potentialities centre is pre-eminently Man, the Purusha. It is the Son of Man who is supremely capable of incarnating God. This Man is the Manu, the thinker, the Manomaya Purusha, mental person or soul in mind of the ancient sages. No mere superior mammal is he, but a conceptive soul basing itself on the animal body in Matter. He is conscious Name or Numen accepting and utilising form as a medium through which Person can deal with

substance. The animal life emerging out of Matter is only the inferior term of his existence. The life of thought, feeling, will, conscious impulsion, that which we name in its totality Mind, that which strives to seize upon Matter and its vital energies and subject them to the law of its own progressive transformation, is the middle term in which he takes his effectual station. But there is equally a supreme term which Mind in man searches after so that having found he may affirm it in his mental and bodily existence. This practical affirmation of something essentially superior to his present self is the basis of the divine life in the human being.

Awakened to a profounder self-knowledge than his first mental idea of himself, Man begins to conceive some formula and to perceive some appearance of the thing that he has to affirm. But it appears to him as if poised between two negations of itself. If, beyond his present attainment, he perceives or is touched by the power, light, bliss of a self-conscious infinite existence and translates his thought or his experience of it into terms convenient for his mentality,—Infinity, Omniscience, Omnipotence, Immortality, Freedom, Love, Beatitude, God,—yet does this sun of his seeing appear to shine between a double Night,—a darkness below, a mightier darkness beyond. For when he strives to know it utterly, it seems to pass into something which neither any one of these terms nor the sum of them can at all represent. His mind at last negates God for a Beyond, or at least it seems to find God transcending Himself, denying Himself to the conception. Here also, in the world, in himself, and around himself, he is met always by the opposites of his affirmation. Death is ever with him, limitation invests his being and his experience, error, inconscience, weakness, inertia, grief, pain, evil are constant oppressors of his effort. Here also he is driven to deny God, or at least the Divine seems to negate or to hide itself in some appearance or outcome which is other than its true and eternal reality.

And the terms of this denial are not, like that other and remoter negation, inconceivable and therefore naturally mysterious, unknowable to his mind, but appear to be knowable,

known, definite, — and still mysterious. He knows not what they are, why they exist, how they came into being. He sees their processes as they affect and appear to him; he cannot fathom their essential reality.

Perhaps they are unfathomable, perhaps they also are really unknowable in their essence? Or, it may be, they have no essential reality, — are an illusion, Asat, non-being. The superior Negation appears to us sometimes as a Nihil, a Non-Existence; this inferior negation may also be, in its essence, a Nihil, a non-existence. But as we have already put away from us this evasion of the difficulty with regard to that higher, so also we discard it for this inferior Asat. To deny entirely its reality or to seek an escape from it as a mere disastrous illusion is to put away from us the problem and to shun our work. For Life, these things that seem to deny God, to be the opposites of Sachchidananda, are real, even if they turn out to be temporary. They and their opposites, good, knowledge, joy, pleasure, life, survival, strength, power, increase, are the very material of her workings.

It is probable indeed that they are the result or rather the inseparable accompaniments, not of an illusion, but of a wrong relation, wrong because it is founded on a false view of what the individual is in the universe and therefore a false attitude both towards God and Nature, towards self and environment. Because that which he has become is out of harmony both with what the world of his habitation is and what he himself should be and is to be, therefore man is subject to these contradictions of the secret Truth of things. In that case they are not the punishment of a fall, but the conditions of a progress. They are the first elements of the work he has to fulfil, the price he has to pay for the crown which he hopes to win, the narrow way by which Nature escapes out of Matter into consciousness; they are at once her ransom and her stock.

For out of these false relations and by their aid the true have to be found. By the Ignorance we have to cross over death. So too the Veda speaks cryptically of energies that are like women evil in impulse, wandering from the path, doing hurt to their Lord, which yet, though themselves false and unhappy, build up in the

end "this vast Truth", the Truth that is the Bliss. It would be, then, not when he has excised the evil in Nature out of himself by an act of moral surgery or parted with life by an abhorrent recoil, but when he has turned Death into a more perfect life, lifted the small things of the human limitation into the great things of the divine vastness, transformed suffering into beatitude, converted evil into its proper good, translated error and falsehood into their secret truth that the sacrifice will be accomplished, the journey done and Heaven and Earth equalised join hands in the bliss of the Supreme.

Yet how can such contraries pass into each other? By what alchemy shall this lead of mortality be turned into that gold of divine Being? But if they are not in their essence contraries? If they are manifestations of one Reality, identical in substance? Then indeed a divine transmutation becomes conceivable.

We have seen that the Non-Being beyond may well be an inconceivable existence and perhaps an ineffable Bliss. At least the Nirvana of Buddhism which formulated one most luminous effort of man to reach and to rest in this highest Non-Existence, represents itself in the psychology of the liberated yet upon earth as an unspeakable peace and gladness; its practical effect is the extinction of all suffering through the disappearance of all egoistic idea or sensation and the nearest we can get to a positive conception of it is that it is some inexpressible Beatitude (if the name or any name can be applied to a peace so void of contents) into which even the notion of self-existence seems to be swallowed up and disappear. It is a Sachchidananda to which we dare no longer apply even the supreme terms of Sat, of Chit and of Ananda. For all terms are annulled and all cognitive experience is overpassed.

On the other hand, we have hazarded the suggestion that since all is one Reality, this inferior negation also, this other contradiction or non-existence of Sachchidananda is none other than Sachchidananda itself. It is capable of being conceived by the intellect, perceived in the vision, even received through the sensations as verily that which it seems to deny, and such would it always be to our conscious experience if things were not

falsified by some great fundamental error, some possessing and compelling Ignorance, Maya or Avidya. In this sense a solution might be sought, not perhaps a satisfying metaphysical solution for the logical mind,—for we are standing on the border-line of the unknowable, the ineffable and straining our eyes beyond,—but a sufficient basis in experience for the practice of the divine life.

To do this we must dare to go below the clear surfaces of things on which the mind loves to dwell, to tempt the vast and obscure, to penetrate the unfathomable depths of consciousness and identify ourselves with states of being that are not our own. Human language is a poor help in such a search, but at least we may find in it some symbols and figures, return with some just expressible hints which will help the light of the soul and throw upon the mind some reflection of the ineffable design.

Chapter VII

The Ego and the Dualities

The soul seated on the same tree of Nature is absorbed and deluded and has sorrow because it is not the Lord, but when it sees and is in union with that other self and greatness of it which is the Lord, then sorrow passes away from it.

*Swetasvatara Upanishad.*¹

IF ALL is in truth Sachchidananda, death, suffering, evil, limitation can only be the creations, positive in practical effect, negative in essence, of a distorting consciousness which has fallen from the total and unifying knowledge of itself into some error of division and partial experience. This is the fall of man typified in the poetic parable of the Hebrew Genesis. That fall is his deviation from the full and pure acceptance of God and himself, or rather of God in himself, into a dividing consciousness which brings with it all the train of the dualities, life and death, good and evil, joy and pain, completeness and want, the fruit of a divided being. This is the fruit which Adam and Eve, Purusha and Prakriti, the soul tempted by Nature, have eaten. The redemption comes by the recovery of the universal in the individual and of the spiritual term in the physical consciousness. Then alone the soul in Nature can be allowed to partake of the fruit of the tree of life and be as the Divine and live for ever. For then only can the purpose of its descent into material consciousness be accomplished, when the knowledge of good and evil, joy and suffering, life and death has been accomplished through the recovery by the human soul of a higher knowledge which reconciles and identifies these opposites in the universal and transforms their divisions into the image of the divine Unity.

¹ IV. 7.

To Sachchidananda extended in all things in widest commonality and impartial universality, death, suffering, evil and limitation can only be at the most reverse terms, shadow-forms of their luminous opposites. As these things are felt by us, they are notes of a discord. They formulate separation where there should be a unity, miscomprehension where there should be an understanding, an attempt to arrive at independent harmonies where there should be a self-adaptation to the orchestral whole. All totality, even if it be only in one scheme of the universal vibrations, even if it be only a totality of the physical consciousness without possession of all that is in movement beyond and behind, must be to that extent a reversion to harmony and a reconciliation of jarring opposites. On the other hand, to Sachchidananda transcendent of the forms of the universe the dual terms themselves, even so understood, can no longer be justly applicable. Transcendence transfigures; it does not reconcile, but rather transmutes opposites into something surpassing them that effaces their oppositions.

At first, however, we must strive to relate the individual again to the harmony of the totality. There it is necessary for us — otherwise there is no issue from the problem — to realise that the terms in which our present consciousness renders the values of the universe, though practically justified for the purposes of human experience and progress, are not the sole terms in which it is possible to render them and may not be the complete, the right, the ultimate formulas. Just as there may be sense-organs or formations of sense-capacity which see the physical world differently and it may well be better, because more completely, than our sense-organs and sense-capacity, so there may be other mental and supramental envisagings of the universe which surpass our own. States of consciousness there are in which Death is only a change in immortal Life, pain a violent backwash of the waters of universal delight, limitation a turning of the Infinite upon itself, evil a circling of the good around its own perfection; and this not in abstract conception only, but in actual vision and in constant and substantial experience. To arrive at such states of consciousness may, for the individual, be one of the

most important and indispensable steps of his progress towards self-perfection.

Certainly, the practical values given us by our senses and by the dualistic sense-mind must hold good in their field and be accepted as the standard for ordinary life-experience until a larger harmony is ready into which they can enter and transform themselves without losing hold of the realities which they represent. To enlarge the sense-faculties without the knowledge that would give the old sense-values their right interpretation from the new standpoint might lead to serious disorders and incapacities, might unfit for practical life and for the orderly and disciplined use of the reason. Equally, an enlargement of our mental consciousness out of the experience of the egoistic dualities into an unregulated unity with some form of total consciousness might easily bring about a confusion and incapacity for the active life of humanity in the established order of the world's relativities. This, no doubt, is the root of the injunction imposed in the Gita on the man who has the knowledge not to disturb the life-basis and thought-basis of the ignorant; for, impelled by his example but unable to comprehend the principle of his action, they would lose their own system of values without arriving at a higher foundation.

Such a disorder and incapacity may be accepted personally and are accepted by many great souls as a temporary passage or as the price to be paid for the entry into a wider existence. But the right goal of human progress must be always an effective and synthetic reinterpretation by which the law of that wider existence may be represented in a new order of truths and in a more just and puissant working of the faculties on the life-material of the universe. For the senses the sun goes round the earth; that was for them the centre of existence and the motions of life are arranged on the basis of a misconception. The truth is the very opposite, but its discovery would have been of little use if there were not a science that makes the new conception the centre of a reasoned and ordered knowledge putting their right values on the perceptions of the senses. So also for the mental consciousness God moves round the personal ego and all His

works and ways are brought to the judgment of our egoistic sensations, emotions and conceptions and are there given values and interpretations which, though a perversion and inversion of the truth of things, are yet useful and practically sufficient in a certain development of human life and progress. They are a rough practical systematisation of our experience of things valid so long as we dwell in a certain order of ideas and activities. But they do not represent the last and highest state of human life and knowledge. "Truth is the path and not the falsehood." The truth is not that God moves round the ego as the centre of existence and can be judged by the ego and its view of the dualities, but that the Divine is itself the centre and that the experience of the individual only finds its own true truth when it is known in the terms of the universal and the transcendent. Nevertheless, to substitute this conception for the egoistic without an adequate base of knowledge may lead to the substitution of new but still false and arbitrary ideas for the old and bring about a violent instead of a settled disorder of right values. Such a disorder often marks the inception of new philosophies and religions and initiates useful revolutions. But the true goal is only reached when we can group round the right central conception a reasoned and effective knowledge in which the egoistic life shall rediscover all its values transformed and corrected. Then we shall possess that new order of truths which will make it possible for us to substitute a more divine life for the existence which we now lead and to effectualise a more divine and puissant use of our faculties on the life-material of the universe.

That new life and power of the human integer must necessarily repose on a realisation of the great verities which translate into our mode of conceiving things the nature of the divine existence. It must proceed through a renunciation by the ego of its false standpoint and false certainties, through its entry into a right relation and harmony with the totalities of which it forms a part and with the transcendences from which it is a descent, and through its perfect self-opening to a truth and a law that exceed its own conventions,—a truth that shall be its fulfilment and a law that shall be its deliverance. Its goal must

be the abolition of those values which are the creations of the egoistic view of things; its crown must be the transcendence of limitation, ignorance, death, suffering and evil.

The transcendence, the abolition are not possible here on earth and in our human life if the terms of that life are necessarily bound to our present egoistic valuations. If life is in its nature individual phenomenon and not representation of a universal existence and the breathing of a mighty Life-Spirit, if the dualities which are the response of the individual to its contacts are not merely a response but the very essence and condition of all living, if limitation is the inalienable nature of the substance of which our mind and body are formed, disintegration of death the first and last condition of all life, its end and its beginning, pleasure and pain the inseparable dual stuff of all sensation, joy and grief the necessary light and shade of all emotion, truth and error the two poles between which all knowledge must eternally move, then transcendence is only attainable by the abandonment of human life in a Nirvana beyond all existence or by attainment to another world, a heaven quite otherwise constituted than this material universe.

It is not very easy for the customary mind of man, always attached to its past and present associations, to conceive of an existence still human, yet radically changed in what are now our fixed circumstances. We are in respect to our possible higher evolution much in the position of the original Ape of the Darwinian theory. It would have been impossible for that Ape leading his instinctive arboreal life in primeval forests to conceive that there would be one day an animal on the earth who would use a new faculty called reason upon the materials of his inner and outer existence, who would dominate by that power his instincts and habits, change the circumstances of his physical life, build for himself houses of stone, manipulate Nature's forces, sail the seas, ride the air, develop codes of conduct, evolve conscious methods for his mental and spiritual development. And if such a conception had been possible for the Ape-mind, it would still have been difficult for him to imagine that by any progress of Nature or long effort of Will and tendency he himself could

develop into that animal. Man, because he has acquired reason and still more because he has indulged his power of imagination and intuition, is able to conceive an existence higher than his own and even to envisage his personal elevation beyond his present state into that existence. His idea of the supreme state is an absolute of all that is positive to his own concepts and desirable to his own instinctive aspiration,—Knowledge without its negative shadow of error, Bliss without its negation in experience of suffering, Power without its constant denial by incapacity, purity and plenitude of being without the opposing sense of defect and limitation. It is so that he conceives his gods; it is so that he constructs his heavens. But it is not so that his reason conceives of a possible earth and a possible humanity. His dream of God and Heaven is really a dream of his own perfection; but he finds the same difficulty in accepting its practical realisation here for his ultimate aim as would the ancestral Ape if called upon to believe in himself as the future Man. His imagination, his religious aspirations may hold that end before him; but when his reason asserts itself, rejecting imagination and transcendent intuition, he puts it by as a brilliant superstition contrary to the hard facts of the material universe. It becomes then only his inspiring vision of the impossible. All that is possible is a conditioned, limited and precarious knowledge, happiness, power and good.

Yet in the principle of reason itself there is the assertion of a Transcendence. For reason is in its whole aim and essence the pursuit of Knowledge, the pursuit, that is to say, of Truth by the elimination of error. Its view, its aim is not that of a passage from a greater to a lesser error, but it supposes a positive, pre-existent Truth towards which through the dualities of right knowledge and wrong knowledge we can progressively move. If our reason has not the same instinctive certitude with regard to the other aspirations of humanity, it is because it lacks the same essential illumination inherent in its own positive activity. We can just conceive of a positive or absolute realisation of happiness, because the heart to which that instinct for happiness belongs has its own form of certitude, is capable of faith, and because our

minds can envisage the elimination of unsatisfied want which is the apparent cause of suffering. But how shall we conceive of the elimination of pain from nervous sensation or of death from the life of the body? Yet the rejection of pain is a sovereign instinct of the sensations, the rejection of death a dominant claim inherent in the essence of our vitality. But these things present themselves to our reason as instinctive aspirations, not as realisable potentialities.

Yet the same law should hold throughout. The error of the practical reason is an excessive subjection to the apparent fact which it can immediately feel as real and an insufficient courage in carrying profounder facts of potentiality to their logical conclusion. What is, is the realisation of an anterior potentiality; present potentiality is a clue to future realisation. And here potentiality exists; for the mastery of phenomena depends upon a knowledge of their causes and processes and if we know the causes of error, sorrow, pain, death, we may labour with some hope towards their elimination. For knowledge is power and mastery.

In fact, we do pursue as an ideal, so far as we may, the elimination of all these negative or adverse phenomena. We seek constantly to minimise the causes of error, pain and suffering. Science, as its knowledge increases, dreams of regulating birth and of indefinitely prolonging life, if not of effecting the entire conquest of death. But because we envisage only external or secondary causes, we can only think of removing them to a distance and not of eliminating the actual roots of that against which we struggle. And we are thus limited because we strive towards secondary perceptions and not towards root-knowledge, because we know processes of things, but not their essence. We thus arrive at a more powerful manipulation of circumstances, but not at essential control. But if we could grasp the essential nature and the essential cause of error, suffering and death, we might hope to arrive at a mastery over them which should be not relative but entire. We might hope even to eliminate them altogether and justify the dominant instinct of our nature by the conquest of that absolute good, bliss, knowledge and immortality which

our intuitions perceive as the true and ultimate condition of the human being.

The ancient Vedanta presents us with such a solution in the conception and experience of Brahman as the one universal and essential fact and of the nature of Brahman as Sachchidananda.

In this view the essence of all life is the movement of a universal and immortal existence, the essence of all sensation and emotion is the play of a universal and self-existent delight in being, the essence of all thought and perception is the radiation of a universal and all-pervading truth, the essence of all activity is the progression of a universal and self-effecting good.

But the play and movement embodies itself in a multiplicity of forms, a variation of tendencies, an interplay of energies. Multiplicity permits of the interference of a determinative and temporarily deformative factor, the individual ego; and the nature of the ego is a self-limitation of consciousness by a willed ignorance of the rest of its play and its exclusive absorption in one form, one combination of tendencies, one field of the movement of energies. Ego is the factor which determines the reactions of error, sorrow, pain, evil, death; for it gives these values to movements which would otherwise be represented in their right relation to the one Existence, Bliss, Truth and Good. By recovering the right relation we may eliminate the ego-determined reactions, reducing them eventually to their true values; and this recovery can be effected by the right participation of the individual in the consciousness of the totality and in the consciousness of the transcendent which the totality represents.

Into later Vedanta there crept and arrived at fixity the idea that the limited ego is not only the cause of the dualities, but the essential condition for the existence of the universe. By getting rid of the ignorance of the ego and its resultant limitations we do indeed eliminate the dualities, but we eliminate along with them our existence in the cosmic movement. Thus we return to the essentially evil and illusory nature of human existence and the vanity of all effort after perfection in the life of the world. A relative good linked always to its opposite is all that here we can

seek. But if we adhere to the larger and profounder idea that the ego is only an intermediate representation of something beyond itself, we escape from this consequence and are able to apply Vedanta to fulfilment of life and not only to the escape from life. The essential cause and condition of universal existence is the Lord, Ishwara or Purusha, manifesting and occupying individual and universal forms. The limited ego is only an intermediate phenomenon of consciousness necessary for a certain line of development. Following this line the individual can arrive at that which is beyond himself, that which he represents, and can yet continue to represent it, no longer as an obscured and limited ego, but as a centre of the Divine and of the universal consciousness embracing, utilising and transforming into harmony with the Divine all individual determinations.

We have then the manifestation of the divine Conscious Being in the totality of physical Nature as the foundation of human existence in the material universe. We have the emergence of that Conscious Being in an involved and inevitably evolving Life, Mind and Supermind as the condition of our activities; for it is this evolution which has enabled man to appear in Matter and it is this evolution which will enable him progressively to manifest God in the body, — the universal Incarnation. We have in egoistic formation the intermediate and decisive factor which allows the One to emerge as the conscious Many out of that indeterminate totality general, obscure and formless which we call the subconscious, — *hrdaya samudra*, the ocean heart in things of the Rig Veda. We have the dualities of life and death, joy and sorrow, pleasure and pain, truth and error, good and evil as the first formations of egoistic consciousness, the natural and inevitable outcome of its attempt to realise unity in an artificial construction of itself exclusive of the total truth, good, life and delight of being in the universe. We have the dissolution of this egoistic construction by the self-opening of the individual to the universe and to God as the means of that supreme fulfilment to which egoistic life is only a prelude even as animal life was only a prelude to the human. We have the realisation of the All in the individual by the transformation of the limited ego into

a conscious centre of the divine unity and freedom as the term at which the fulfilment arrives. And we have the outflowing of the infinite and absolute Existence, Truth, Good and Delight of being on the Many in the world as the divine result towards which the cycles of our evolution move. This is the supreme birth which maternal Nature holds in herself; of this she strives to be delivered.

Chapter VIII

The Methods of Vedantic Knowledge

This secret Self in all beings is not apparent, but it is seen by
means of the supreme reason, the subtle, by those who have
the subtle vision.

*Katha Upanishad.*¹

BUT WHAT then is the working of this Sachchidananda in the world and by what process of things are the relations between itself and the ego which figures it first formed, then led to their consummation? For on those relations and on the process they follow depend the whole philosophy and practice of a divine life for man.

We arrive at the conception and at the knowledge of a divine existence by exceeding the evidence of the senses and piercing beyond the walls of the physical mind. So long as we confine ourselves to sense-evidence and the physical consciousness, we can conceive nothing and know nothing except the material world and its phenomena. But certain faculties in us enable our mentality to arrive at conceptions which we may indeed deduce by ratiocination or by imaginative variation from the facts of the physical world as we see them, but which are not warranted by any purely physical data or any physical experience. The first of these instruments is the pure reason.

Human reason has a double action, mixed or dependent, pure or sovereign. Reason accepts a mixed action when it confines itself to the circle of our sensible experience, admits its law as the final truth and concerns itself only with the study of phenomenon, that is to say, with the appearances of things in their relations, processes and utilities. This rational action is incapable of knowing what is, it only knows what appears

¹ I. 3. 12.

to be, it has no plummet by which it can sound the depths of being, it can only survey the field of becoming. Reason, on the other hand, asserts its pure action, when accepting our sensible experiences as a starting-point but refusing to be limited by them it goes behind, judges, works in its own right and strives to arrive at general and unalterable concepts which attach themselves not to the appearances of things, but to that which stands behind their appearances. It may arrive at its result by direct judgment passing immediately from the appearance to that which stands behind it and in that case the concept arrived at may seem to be a result of the sensible experience and dependent upon it though it is really a perception of reason working in its own right. But the perceptions of the pure reason may also — and this is their more characteristic action — use the experience from which they start as a mere excuse and leave it far behind before they arrive at their result, so far that the result may seem the direct contrary of that which our sensible experience wishes to dictate to us. This movement is legitimate and indispensable, because our normal experience not only covers only a small part of universal fact, but even in the limits of its own field uses instruments that are defective and gives us false weights and measures. It must be exceeded, put away to a distance and its insistences often denied if we are to arrive at more adequate conceptions of the truth of things. To correct the errors of the sense-mind by the use of reason is one of the most valuable powers developed by man and the chief cause of his superiority among terrestrial beings.

The complete use of pure reason brings us finally from physical to metaphysical knowledge. But the concepts of metaphysical knowledge do not in themselves fully satisfy the demand of our integral being. They are indeed entirely satisfactory to the pure reason itself, because they are the very stuff of its own existence. But our nature sees things through two eyes always, for it views them doubly as idea and as fact and therefore every concept is incomplete for us and to a part of our nature almost unreal until it becomes an experience. But the truths which are now in question, are of an order not subject to our normal experience. They are, in their nature, “beyond the perception of the senses

but seizable by the perception of the reason.” Therefore, some other faculty of experience is necessary by which the demand of our nature can be fulfilled and this can only come, since we are dealing with the supraphysical, by an extension of psychological experience.

In a sense all our experience is psychological since even what we receive by the senses, has no meaning or value to us till it is translated into the terms of the sense-mind, the Manas of Indian philosophical terminology. Manas, say our philosophers, is the sixth sense. But we may even say that it is the only sense and that the others, vision, hearing, touch, smell, taste are merely specialisations of the sense-mind which, although it normally uses the sense-organs for the basis of its experience, yet exceeds them and is capable of a direct experience proper to its own inherent action. As a result psychological experience, like the cognitions of the reason, is capable in man of a double action, mixed or dependent, pure or sovereign. Its mixed action takes place usually when the mind seeks to become aware of the external world, the object; the pure action when it seeks to become aware of itself, the subject. In the former activity, it is dependent on the senses and forms its perceptions in accordance with their evidence; in the latter it acts in itself and is aware of things directly by a sort of identity with them. We are thus aware of our emotions; we are aware of anger, as has been acutely said, because we become anger. We are thus aware also of our own existence; and here the nature of experience as knowledge by identity becomes apparent. In reality, all experience is in its secret nature knowledge by identity; but its true character is hidden from us because we have separated ourselves from the rest of the world by exclusion, by the distinction of ourself as subject and everything else as object, and we are compelled to develop processes and organs by which we may again enter into communion with all that we have excluded. We have to replace direct knowledge through conscious identity by an indirect knowledge which appears to be caused by physical contact and mental sympathy. This limitation is a fundamental creation of the ego and an instance of the manner

in which it has proceeded throughout, starting from an original falsehood and covering over the true truth of things by contingent falsehoods which become for us practical truths of relation.

From this nature of mental and sense knowledge as it is at present organised in us, it follows that there is no inevitable necessity in our existing limitations. They are the result of an evolution in which mind has accustomed itself to depend upon certain physiological functionings and their reactions as its normal means of entering into relation with the material universe. Therefore, although it is the rule that when we seek to become aware of the external world, we have to do so indirectly through the sense-organs and can experience only so much of the truth about things and men as the senses convey to us, yet this rule is merely the regularity of a dominant habit. It is possible for the mind—and it would be natural for it, if it could be persuaded to liberate itself from its consent to the domination of matter,—to take direct cognisance of the objects of sense without the aid of the sense-organs. This is what happens in experiments of hypnosis and cognate psychological phenomena. Because our waking consciousness is determined and limited by the balance between mind and matter worked out by life in its evolution, this direct cognisance is usually impossible in our ordinary waking state and has therefore to be brought about by throwing the waking mind into a state of sleep which liberates the true or subliminal mind. Mind is then able to assert its true character as the one and all-sufficient sense and free to apply to the objects of sense its pure and sovereign instead of its mixed and dependent action. Nor is this extension of faculty really impossible but only more difficult in our waking state,—as is known to all who have been able to go far enough in certain paths of psychological experiment.

The sovereign action of the sense-mind can be employed to develop other senses besides the five which we ordinarily use. For instance, it is possible to develop the power of appreciating accurately without physical means the weight of an object

which we hold in our hands. Here the sense of contact and pressure is merely used as a starting-point, just as the data of sense-experience are used by the pure reason, but it is not really the sense of touch which gives the measure of the weight to the mind; that finds the right value through its own independent perception and uses the touch only in order to enter into relation with the object. And as with the pure reason, so with the sense-mind, the sense-experience can be used as a mere first point from which it proceeds to a knowledge that has nothing to do with the sense-organs and often contradicts their evidence. Nor is the extension of faculty confined only to outsides and superficies. It is possible, once we have entered by any of the senses into relation with an external object, so to apply the Manas as to become aware of the contents of the object, for example, to receive or to perceive the thoughts or feelings of others without aid from their utterance, gesture, action or facial expressions and even in contradiction of these always partial and often misleading data. Finally, by an utilisation of the inner senses, — that is to say, of the sense-powers, in themselves, in their purely mental or subtle activity as distinguished from the physical which is only a selection for the purposes of outward life from their total and general action, — we are able to take cognition of sense-experiences, of appearances and images of things other than those which belong to the organisation of our material environment. All these extensions of faculty, though received with hesitation and incredulity by the physical mind because they are abnormal to the habitual scheme of our ordinary life and experience, difficult to set in action, still more difficult to systematise so as to be able to make of them an orderly and serviceable set of instruments, must yet be admitted, since they are the invariable result of any attempt to enlarge the field of our superficially active consciousness whether by some kind of untaught effort and casual ill-ordered effect or by a scientific and well-regulated practice.

None of them, however, leads to the aim we have in view, the psychological experience of those truths that are “beyond perception by the sense but seizable by the perceptions of the

reason”, *buddhigrāhyam atīndriyam*.² They give us only a larger field of phenomena and more effective means for the observation of phenomena. The truth of things always escapes beyond the sense. Yet is it a sound rule inherent in the very constitution of universal existence that where there are truths attainable by the reason, there must be somewhere in the organism possessed of that reason a means of arriving at or verifying them by experience. The one means we have left in our mentality is an extension of that form of knowledge by identity which gives us the awareness of our own existence. It is really upon a self-awareness more or less conscient, more or less present to our conception that the knowledge of the contents of our self is based. Or to put it in a more general formula, the knowledge of the contents is contained in the knowledge of the continent. If then we can extend our faculty of mental self-awareness to awareness of the Self beyond and outside us, Atman or Brahman of the Upanishads, we may become possessors in experience of the truths which form the contents of the Atman or Brahman in the universe. It is on this possibility that Indian Vedanta has based itself. It has sought through knowledge of the Self the knowledge of the universe.

But always mental experience and the concepts of the reason have been held by it to be even at their highest a reflection in mental identifications and not the supreme self-existent identity. We have to go beyond the mind and the reason. The reason active in our waking consciousness is only a mediator between the subconscious All that we come from in our evolution upwards and the superconscious All towards which we are impelled by that evolution. The subconscious and the superconscious are two different formulations of the same All. The master-word of the subconscious is Life, the master-word of the superconscious is Light. In the subconscious knowledge or consciousness is involved in action, for action is the essence of Life. In the superconscious action re-enters into Light and no longer contains involved knowledge but is itself contained in a supreme

² *Gita*, VI. 21.

consciousness. Intuitive knowledge is that which is common between them and the foundation of intuitive knowledge is conscious or effective identity between that which knows and that which is known; it is that state of common self-existence in which the knower and the known are one through knowledge. But in the subconscious the intuition manifests itself in the action, in effectivity, and the knowledge or conscious identity is either entirely or more or less concealed in the action. In the superconscious, on the contrary, Light being the law and the principle, the intuition manifests itself in its true nature as knowledge emerging out of conscious identity, and effectivity of action is rather the accompaniment or necessary consequent and no longer masks as the primary fact. Between these two states reason and mind act as intermediaries which enable the being to liberate knowledge out of its imprisonment in the act and prepare it to resume its essential primacy. When the self-awareness in the mind applied both to continent and content, to own-self and other-self, exalts itself into the luminous self-manifest identity, the reason also converts itself into the form of the self-luminous intuitive³ knowledge. This is the highest possible state of our knowledge when mind fulfils itself in the supramental.

Such is the scheme of the human understanding upon which the conclusions of the most ancient Vedanta were built. To develop the results arrived at on this foundation by the ancient sages is not my object, but it is necessary to pass briefly in review some of their principal conclusions so far as they affect the problem of the divine Life with which alone we are at present concerned. For it is in those ideas that we shall find the best previous foundation of that which we seek now to rebuild and although, as with all knowledge, old expression has to be replaced to a certain extent by new expression suited to a later mentality and old light has to merge itself into new light

³ I use the word "intuition" for want of a better. In truth, it is a makeshift and inadequate to the connotation demanded of it. The same has to be said of the word "consciousness" and many others which our poverty compels us to extend illegitimately in their significance.

as dawn succeeds dawn, yet it is with the old treasure as our initial capital or so much of it as we can recover that we shall most advantageously proceed to accumulate the largest gains in our new commerce with the ever-changeless and ever-changing Infinite.

Sad Brahman, Existence pure, indefinable, infinite, absolute, is the last concept at which Vedantic analysis arrives in its view of the universe, the fundamental Reality which Vedantic experience discovers behind all the movement and formation which constitute the apparent reality. It is obvious that when we posit this conception, we go entirely beyond what our ordinary consciousness, our normal experience contains or warrants. The senses and sense-mind know nothing whatever about any pure or absolute existence. All that our sense-experience tells us of, is form and movement. Forms exist, but with an existence that is not pure, rather always mixed, combined, aggregated, relative. When we go within ourselves, we may get rid of precise form, but we cannot get rid of movement, of change. Motion of Matter in Space, motion of change in Time seem to be the condition of existence. We may say indeed, if we like, that this is existence and that the idea of existence in itself corresponds to no discoverable reality. At the most in the phenomenon of self-awareness or behind it, we get sometimes a glimpse of something immovable and immutable, something that we vaguely perceive or imagine that we are beyond all life and death, beyond all change and formation and action. Here is the one door in us that sometimes swings open upon the splendour of a truth beyond and, before it shuts again, allows a ray to touch us,—a luminous intimation which, if we have the strength and firmness, we may hold to in our faith and make a starting-point for another play of consciousness than that of the sense-mind, for the play of Intuition.

For if we examine carefully, we shall find that Intuition is our first teacher. Intuition always stands veiled behind our mental operations. Intuition brings to man those brilliant messages from the Unknown which are the beginning of his higher knowledge. Reason only comes in afterwards to see what profit it can have

of the shining harvest. Intuition gives us that idea of something behind and beyond all that we know and seem to be which pursues man always in contradiction of his lower reason and all his normal experience and impels him to formulate that formless perception in the more positive ideas of God, Immortality, Heaven and the rest by which we strive to express it to the mind. For Intuition is as strong as Nature herself from whose very soul it has sprung and cares nothing for the contradictions of reason or the denials of experience. It knows what is because it is, because itself it is of that and has come from that, and will not yield it to the judgment of what merely becomes and appears. What the Intuition tells us of, is not so much Existence as the Existent, for it proceeds from that one point of light in us which gives it its advantage, that sometimes opened door in our own self-awareness. Ancient Vedanta seized this message of the Intuition and formulated it in the three great declarations of the Upanishads, "I am He", "Thou art That, O Swetaketu", "All this is the Brahman; this Self is the Brahman".

But Intuition by the very nature of its action in man, working as it does from behind the veil, active principally in his more unenlightened, less articulate parts, served in front of the veil, in the narrow light which is our waking conscience, only by instruments that are unable fully to assimilate its messages,— Intuition is unable to give us the truth in that ordered and articulated form which our nature demands. Before it could effect any such completeness of direct knowledge in us, it would have to organise itself in our surface being and take possession there of the leading part. But in our surface being it is not the Intuition, it is the Reason which is organised and helps us to order our perceptions, thoughts and actions. Therefore the age of intuitive knowledge, represented by the early Vedantic thinking of the Upanishads, had to give place to the age of rational knowledge; inspired Scripture made room for metaphysical philosophy, even as afterwards metaphysical philosophy had to give place to experimental Science. Intuitive thought which is a messenger from the superconscious and therefore our highest faculty, was supplanted by the pure reason which is only a sort of deputy

and belongs to the middle heights of our being; pure reason in its turn was supplanted for a time by the mixed action of the reason which lives on our plains and lower elevations and does not in its view exceed the horizon of the experience that the physical mind and senses or such aids as we can invent for them can bring to us. And this process which seems to be a descent, is really a circle of progress. For in each case the lower faculty is compelled to take up as much as it can assimilate of what the higher had already given and to attempt to re-establish it by its own methods. By the attempt it is itself enlarged in its scope and arrives eventually at a more supple and a more ample self-accommodation to the higher faculties. Without this succession and attempt at separate assimilation we should be obliged to remain under the exclusive domination of a part of our nature while the rest remained either depressed and unduly subjected or separate in its field and therefore poor in its development. With this succession and separate attempt the balance is righted; a more complete harmony of our parts of knowledge is prepared.

We see this succession in the Upanishads and the subsequent Indian philosophies. The sages of the Veda and Vedanta relied entirely upon intuition and spiritual experience. It is by an error that scholars sometimes speak of great debates or discussions in the Upanishad. Wherever there is the appearance of a controversy, it is not by discussion, by dialectics or the use of logical reasoning that it proceeds, but by a comparison of intuitions and experiences in which the less luminous gives place to the more luminous, the narrower, faultier or less essential to the more comprehensive, more perfect, more essential. The question asked by one sage of another is "What dost thou know?", not "What dost thou think?" nor "To what conclusion has thy reasoning arrived?" Nowhere in the Upanishads do we find any trace of logical reasoning urged in support of the truths of Vedanta. Intuition, the sages seem to have held, must be corrected by a more perfect intuition; logical reasoning cannot be its judge.

And yet the human reason demands its own method of satisfaction. Therefore when the age of rationalistic speculation began, Indian philosophers, respectful of the heritage of the past,

adopted a double attitude towards the Truth they sought. They recognised in the Sruti, the earlier results of Intuition or, as they preferred to call it, of inspired Revelation, an authority superior to Reason. But at the same time they started from Reason and tested the results it gave them, holding only those conclusions to be valid which were supported by the supreme authority. In this way they avoided to a certain extent the besetting sin of metaphysics, the tendency to battle in the clouds because it deals with words as if they were imperative facts instead of symbols which have always to be carefully scrutinised and brought back constantly to the sense of that which they represent. Their speculations tended at first to keep near at the centre to the highest and profoundest experience and proceeded with the united consent of the two great authorities, Reason and Intuition. Nevertheless, the natural trend of Reason to assert its own supremacy triumphed in effect over the theory of its subordination. Hence the rise of conflicting schools each of which founded itself in theory on the Veda and used its texts as a weapon against the others. For the highest intuitive Knowledge sees things in the whole, in the large and details only as sides of the indivisible whole; its tendency is towards immediate synthesis and the unity of knowledge. Reason, on the contrary, proceeds by analysis and division and assembles its facts to form a whole; but in the assemblage so formed there are opposites, anomalies, logical incompatibilities, and the natural tendency of Reason is to affirm some and to negate others which conflict with its chosen conclusions so that it may form a flawlessly logical system. The unity of the first intuitional knowledge was thus broken up and the ingenuity of the logicians was always able to discover devices, methods of interpretation, standards of varying value by which inconvenient texts of the Scripture could be practically annulled and an entire freedom acquired for their metaphysical speculation.

Nevertheless, the main conceptions of the earlier Vedanta remained in parts in the various philosophical systems and efforts were made from time to time to recombine them into some image of the old catholicity and unity of intuitional thought. And behind the thought of all, variously presented, survived as

the fundamental conception, Purusha, Atman or Sad Brahman, the pure Existent of the Upanishads, often rationalised into an idea or psychological state, but still carrying something of its old burden of inexpressible reality. What may be the relation of the movement of becoming which is what we call the world to this absolute Unity and how the ego, whether generated by the movement or cause of the movement, can return to that true Self, Divinity or Reality declared by the Vedanta, these were the questions speculative and practical which have always occupied the thought of India.

Chapter IX

The Pure Existent

One indivisible that is pure existence.

*Chhandogya Upanishad.*¹

WHEN we withdraw our gaze from its egoistic preoccupation with limited and fleeting interests and look upon the world with dispassionate and curious eyes that search only for the Truth, our first result is the perception of a boundless energy of infinite existence, infinite movement, infinite activity pouring itself out in limitless Space, in eternal Time, an existence that surpasses infinitely our ego or any ego or any collectivity of egos, in whose balance the grandiose products of aeons are but the dust of a moment and in whose incalculable sum numberless myriads count only as a petty swarm. We instinctively act and feel and weave our life thoughts as if this stupendous world movement were at work around us as centre and for our benefit, for our help or harm, or as if the justification of our egoistic cravings, emotions, ideas, standards were its proper business even as they are our own chief concern. When we begin to see, we perceive that it exists for itself, not for us, has its own gigantic aims, its own complex and boundless idea, its own vast desire or delight that it seeks to fulfil, its own immense and formidable standards which look down as if with an indulgent and ironic smile at the pettiness of ours. And yet let us not swing over to the other extreme and form too positive an idea of our own insignificance. That too would be an act of ignorance and the shutting of our eyes to the great facts of the universe.

¹ VI. 2. 1.

For this boundless Movement does not regard us as unimportant to it. Science reveals to us how minute is the care, how cunning the device, how intense the absorption it bestows upon the smallest of its works even as on the largest. This mighty energy is an equal and impartial mother, *samat brahma*, in the great term of the Gita, and its intensity and force of movement is the same in the formation and upholding of a system of suns and the organisation of the life of an ant-hill. It is the illusion of size, of quantity that induces us to look on the one as great, the other as petty. If we look, on the contrary, not at mass of quantity but force of quality, we shall say that the ant is greater than the solar system it inhabits and man greater than all inanimate Nature put together. But this again is the illusion of quality. When we go behind and examine only the intensity of the movement of which quality and quantity are aspects, we realise that this Brahman dwells equally in all existences. Equally partaken of by all in its being, we are tempted to say, equally distributed to all in its energy. But this too is an illusion of quantity. Brahman dwells in all, indivisible, yet as if divided and distributed. If we look again with an observing perception not dominated by intellectual concepts, but informed by intuition and culminating in knowledge by identity, we shall see that the consciousness of this infinite Energy is other than our mental consciousness, that it is indivisible and gives, not an equal part of itself, but its whole self at one and the same time to the solar system and to the ant-hill. To Brahman there are no whole and parts, but each thing is all itself and benefits by the whole of Brahman. Quality and quantity differ, the self is equal. The form and manner and result of the force of action vary infinitely, but the eternal, primal, infinite energy is the same in all. The force of strength that goes to make the strong man is no whit greater than the force of weakness that goes to make the weak. The energy spent is as great in repression as in expression, in negation as in affirmation, in silence as in sound.

Therefore the first reckoning we have to mend is that between this infinite Movement, this energy of existence which is the world and ourselves. At present we keep a false account. We

are infinitely important to the All, but to us the All is negligible; we alone are important to ourselves. This is the sign of the original ignorance which is the root of the ego, that it can only think with itself as centre as if it were the All, and of that which is not itself accepts only so much as it is mentally disposed to acknowledge or as it is forced to recognise by the shocks of its environment. Even when it begins to philosophise, does it not assert that the world only exists in and by its consciousness? Its own state of consciousness or mental standards are to it the test of reality; all outside its orbit or view tends to become false or non-existent. This mental self-sufficiency of man creates a system of false accountantship which prevents us from drawing the right and full value from life. There is a sense in which these pretensions of the human mind and ego repose on a truth, but this truth only emerges when the mind has learned its ignorance and the ego has submitted to the All and lost in it its separate self-assertion. To recognise that we, or rather the results and appearances we call ourselves, are only a partial movement of this infinite Movement and that it is that infinite which we have to know, to be consciously and to fulfil faithfully, is the commencement of true living. To recognise that in our true selves we are one with the total movement and not minor or subordinate is the other side of the account, and its expression in the manner of our being, thought, emotion and action is necessary to the culmination of a true or divine living.

But to settle the account we have to know what is this All, this infinite and omnipotent energy. And here we come to a fresh complication. For it is asserted to us by the pure reason and it seems to be asserted to us by Vedanta that as we are subordinate and an aspect of this Movement, so the movement is subordinate and an aspect of something other than itself, of a great timeless, spaceless Stability, *sthānu*, which is immutable, inexhaustible and unexpended, not acting though containing all this action, not energy, but pure existence. Those who see only this world-energy can declare indeed that there is no such thing: our idea of an eternal stability, an immutable pure existence is a fiction of our intellectual conceptions starting from a

false idea of the stable: for there is nothing that is stable; all is movement and our conception of the stable is only an artifice of our mental consciousness by which we secure a standpoint for dealing practically with the movement. It is easy to show that this is true in the movement itself. There is nothing there that is stable. All that appears to be stationary is only a block of movement, a formulation of energy at work which so affects our consciousness that it seems to be still, somewhat as the earth seems to us to be still, somewhat as a train in which we are travelling seems to be still in the midst of a rushing landscape. But is it equally true that underlying this movement, supporting it, there is nothing that is moveless and immutable? Is it true that existence consists only in the action of energy? Or is it not rather that energy is an output of Existence?

We see at once that if such an Existence is, it must be, like the Energy, infinite. Neither reason nor experience nor intuition nor imagination bears witness to us of the possibility of a final terminus. All end and beginning presuppose something beyond the end or beginning. An absolute end, an absolute beginning is not only a contradiction in terms, but a contradiction of the essence of things, a violence, a fiction. Infinity imposes itself upon the appearances of the finite by its ineffugable self-existence.

But this is infinity with regard to Time and Space, an eternal duration, interminable extension. The pure Reason goes farther and looking in its own colourless and austere light at Time and Space points out that these two are categories of our consciousness, conditions under which we arrange our perception of phenomenon. When we look at existence in itself, Time and Space disappear. If there is any extension, it is not a spatial but a psychological extension; if there is any duration, it is not a temporal but a psychological duration; and it is then easy to see that this extension and duration are only symbols which represent to the mind something not translatable into intellectual terms, an eternity which seems to us the same all-containing ever-new moment, an infinity which seems to us the same all-containing all-pervading point without magnitude. And this conflict of terms, so violent, yet accurately expressive of something we do

perceive, shows that mind and speech have passed beyond their natural limits and are striving to express a Reality in which their own conventions and necessary oppositions disappear into an ineffable identity.

But is this a true record? May it not be that Time and Space so disappear merely because the existence we are regarding is a fiction of the intellect, a fantastic Nihil created by speech, which we strive to erect into a conceptual reality? We regard again that Existence-in-itself and we say, No. There is something behind the phenomenon not only infinite but indefinable. Of no phenomenon, of no totality of phenomena can we say that absolutely it is. Even if we reduce all phenomena to one fundamental, universal irreducible phenomenon of movement or energy, we get only an indefinable phenomenon. The very conception of movement carries with it the potentiality of repose and betrays itself as an activity of some existence; the very idea of energy in action carries with it the idea of energy abstaining from action; and an absolute energy not in action is simply and purely absolute existence. We have only these two alternatives, either an indefinable pure existence or an indefinable energy in action and, if the latter alone is true, without any stable base or cause, then the energy is a result and phenomenon generated by the action, the movement which alone is. We have then no Existence, or we have the Nihil of the Buddhists with existence as only an attribute of an eternal phenomenon, of Action, of Karma, of Movement. This, asserts the pure reason, leaves my perceptions unsatisfied, contradicts my fundamental seeing, and therefore cannot be. For it brings us to a last abruptly ceasing stair of an ascent which leaves the whole staircase without support, suspended in the Void.

If this indefinable, infinite, timeless, spaceless Existence is, it is necessarily a pure absolute. It cannot be summed up in any quantity or quantities, it cannot be composed of any quality or combination of qualities. It is not an aggregate of forms or a formal substratum of forms. If all forms, quantities, qualities were to disappear, this would remain. Existence without quantity, without quality, without form is not only conceivable, but

it is the one thing we can conceive behind these phenomena. Necessarily, when we say it is without them, we mean that it exceeds them, that it is something into which they pass in such a way as to cease to be what we call form, quality, quantity and out of which they emerge as form, quality and quantity in the movement. They do not pass away into one form, one quality, one quantity which is the basis of all the rest,—for there is none such,—but into something which cannot be defined by any of these terms. So all things that are conditions and appearances of the movement pass into That from which they have come and there, so far as they exist, become something that can no longer be described by the terms that are appropriate to them in the movement. Therefore we say that the pure existence is an Absolute and in itself unknowable by our thought although we can go back to it in a supreme identity that transcends the terms of knowledge. The movement, on the contrary, is the field of the relative and yet by the very definition of the relative all things in the movement contain, are contained in and are the Absolute. The relation of the phenomena of Nature to the fundamental ether which is contained in them, constitutes them, contains them and yet is so different from them that entering into it they cease to be what they now are, is the illustration given by the Vedanta as most nearly representing this identity in difference between the Absolute and the relative.

Necessarily, when we speak of things passing into that from which they have come, we are using the language of our temporal consciousness and must guard ourselves against its illusions. The emergence of the movement from the Immutable is an eternal phenomenon and it is only because we cannot conceive it in that beginningless, endless, ever-new moment which is the eternity of the Timeless that our notions and perceptions are compelled to place it in a temporal eternity of successive duration to which are attached the ideas of an always recurrent beginning, middle and end.

But all this, it may be said, is valid only so long as we accept the concepts of pure reason and remain subject to them. But the concepts of reason have no obligatory force. We must judge of

existence not by what we mentally conceive, but by what we see to exist. And the purest, freest form of insight into existence as it is shows us nothing but movement. Two things alone exist, movement in Space, movement in Time, the former objective, the latter subjective. Extension is real, duration is real, Space and Time are real. Even if we can go behind extension in Space and perceive it as a psychological phenomenon, as an attempt of the mind to make existence manageable by distributing the indivisible whole in a conceptual Space, yet we cannot go behind the movement of succession and change in Time. For that is the very stuff of our consciousness. We are and the world is a movement that continually progresses and increases by the inclusion of all the successions of the past in a present which represents itself to us as the beginning of all the successions of the future,—a beginning, a present that always eludes us because it is not, for it has perished before it is born. What is, is the eternal, indivisible succession of Time carrying on its stream a progressive movement of consciousness also indivisible.² Duration then, eternally successive movement and change in Time, is the sole absolute. Becoming is the only being.

In reality, this opposition of actual insight into being to the conceptual fictions of the pure Reason is fallacious. If indeed intuition in this matter were really opposed to intelligence, we could not confidently support a merely conceptual reasoning against fundamental insight. But this appeal to intuitive experience is incomplete. It is valid only so far as it proceeds and it errs by stopping short of the integral experience. So long as the intuition fixes itself only upon that which we become, we see ourselves as a continual progression of movement and change in consciousness in the eternal succession of Time. We are the river, the flame of the Buddhist illustration. But there is a supreme

² Indivisible in the totality of the movement. Each moment of Time or Consciousness may be considered as separate from its predecessor and successor, each successive action of Energy as a new quantum or new creation; but this does not abrogate continuity without which there would be no duration of Time or coherence of consciousness. A man's steps as he walks or runs or leaps are separate, but there is something that takes the steps and makes the movement continuous.

experience and supreme intuition by which we go back behind our surface self and find that this becoming, change, succession are only a mode of our being and that there is that in us which is not involved at all in the becoming. Not only can we have the intuition of this that is stable and eternal in us, not only can we have the glimpse of it in experience behind the veil of continually fleeting becomings, but we can draw back into it and live in it entirely, so effecting an entire change in our external life, and in our attitude, and in our action upon the movement of the world. And this stability in which we can so live is precisely that which the pure Reason has already given us, although it can be arrived at without reasoning at all, without knowing previously what it is,—it is pure existence, eternal, infinite, indefinable, not affected by the succession of Time, not involved in the extension of Space, beyond form, quantity, quality,—Self only and absolute.

The pure existent is then a fact and no mere concept; it is the fundamental reality. But, let us hasten to add, the movement, the energy, the becoming are also a fact, also a reality. The supreme intuition and its corresponding experience may correct the other, may go beyond, may suspend, but do not abolish it. We have therefore two fundamental facts of pure existence and of world-existence, a fact of Being, a fact of Becoming. To deny one or the other is easy; to recognise the facts of consciousness and find out their relation is the true and fruitful wisdom.

Stability and movement, we must remember, are only our psychological representations of the Absolute, even as are oneness and multitude. The Absolute is beyond stability and movement as it is beyond unity and multiplicity. But it takes its eternal poise in the one and the stable and whirls round itself infinitely, inconceivably, securely in the moving and multitudinous. World-existence is the ecstatic dance of Shiva which multiplies the body of the God numberlessly to the view: it leaves that white existence precisely where and what it was, ever is and ever will be; its sole absolute object is the joy of the dancing.

But as we cannot describe or think out the Absolute in itself,

beyond stability and movement, beyond unity and multitude,—nor is that at all our business,—we must accept the double fact, admit both Shiva and Kali and seek to know what is this measureless Movement in Time and Space with regard to that timeless and spaceless pure Existence, one and stable, to which measure and measurelessness are inapplicable. We have seen what pure Reason, intuition and experience have to say about pure Existence, about Sat; what have they to say about Force, about Movement, about Shakti?

And the first thing we have to ask ourselves is whether that Force is simply force, simply an unintelligent energy of movement or whether the consciousness which seems to emerge out of it in this material world we live in, is not merely one of its phenomenal results but rather its own true and secret nature. In Vedantic terms, is Force simply Prakriti, only a movement of action and process, or is Prakriti really power of Chit, in its nature force of creative self-consciousness? On this essential problem all the rest hinges.

Chapter X

Conscious Force

They beheld the self-force of the Divine Being deep hidden by its own conscious modes of working.

*Swetasvatara Upanishad.*¹

This is he that is awake in those who sleep.

*Katha Upanishad.*²

ALL PHENOMENAL existence resolves itself into Force, into a movement of energy that assumes more or less material, more or less gross or subtle forms for self-presentation to its own experience. In the ancient images by which human thought attempted to make this origin and law of being intelligible and real to itself, this infinite existence of Force was figured as a sea, initially at rest and therefore free from forms, but the first disturbance, the first initiation of movement necessitates the creation of forms and is the seed of a universe.

Matter is the presentation of force which is most easily intelligible to our intelligence, moulded as it is by contacts in Matter to which a mind involved in material brain gives the response. The elementary state of material Force is, in the view of the old Indian physicists, a condition of pure material extension in Space of which the peculiar property is vibration typified to us by the phenomenon of sound. But vibration in this state of ether is not sufficient to create forms. There must first be some obstruction in the flow of the Force ocean, some contraction and expansion, some interplay of vibrations, some impinging of force upon force so as to create a beginning of fixed relations and mutual effects. Material Force modifying its first ethereal

¹ I. 3. ² II. 2. 8.

status assumes a second, called in the old language the aerial, of which the special property is contact between force and force, contact that is the basis of all material relations. Still we have not as yet real forms but only varying forces. A sustaining principle is needed. This is provided by a third self-modification of the primitive Force of which the principle of light, electricity, fire and heat is for us the characteristic manifestation. Even then, we can have forms of force preserving their own character and peculiar action, but not stable forms of Matter. A fourth state characterised by diffusion and a first medium of permanent attractions and repulsions, termed picturesquely water or the liquid state, and a fifth of cohesion, termed earth or the solid state, complete the necessary elements.

All forms of Matter of which we are aware, all physical things even to the most subtle, are built up by the combination of these five elements. Upon them also depends all our sensible experience; for by reception of vibration comes the sense of sound; by contact of things in a world of vibrations of Force the sense of touch; by the action of light in the forms hatched, outlined, sustained by the force of light and fire and heat the sense of sight; by the fourth element the sense of taste; by the fifth the sense of smell. All is essentially response to vibratory contacts between force and force. In this way the ancient thinkers bridged the gulf between pure Force and its final modifications and satisfied the difficulty which prevents the ordinary human mind from understanding how all these forms which are to his senses so real, solid and durable can be in truth only temporary phenomena and a thing like pure energy, to the senses non-existent, intangible and almost incredible, can be the one permanent cosmic reality.

The problem of consciousness is not solved by this theory; for it does not explain how the contact of vibrations of Force should give rise to conscious sensations. The Sankhyas or analytic thinkers posited therefore behind these five elements two principles which they called Mahat and Ahankara, principles which are really non-material; for the first is nothing but the vast cosmic principle of Force and the other the divisional principle of Ego-formation. Nevertheless, these two principles, as also the

principle of intelligence, become active in consciousness not by virtue of Force itself, but by virtue of an inactive Conscious-Soul or souls in which its activities are reflected and by that reflection assume the hue of consciousness.

Such is the explanation of things offered by the school of Indian philosophy which comes nearest to the modern materialistic ideas and which carried the idea of a mechanical or unconscious Force in Nature as far as was possible to a seriously reflective Indian mind. Whatever its defects, its main idea was so indisputable that it came to be generally accepted. However the phenomenon of consciousness may be explained, whether Nature be an inert impulse or a conscious principle, it is certainly Force; the principle of things is a formative movement of energies, all forms are born of meeting and mutual adaptation between unshaped forces, all sensation and action is a response of something in a form of Force to the contacts of other forms of Force. This is the world as we experience it and from this experience we must always start.

Physical analysis of Matter by modern Science has come to the same general conclusion, even if a few last doubts still linger. Intuition and experience confirm this concord of Science and Philosophy. Pure reason finds in it the satisfaction of its own essential conceptions. For even in the view of the world as essentially an act of consciousness, an act is implied and in the act movement of Force, play of Energy. This also, when we examine from within our own experience, proves to be the fundamental nature of the world. All our activities are the play of the triple force of the old philosophies, knowledge-force, desire-force, action-force, and all these prove to be really three streams of one original and identical Power, Adya Shakti. Even our states of rest are only equable state or equilibrium of the play of her movement.

Movement of Force being admitted as the whole nature of the Cosmos, two questions arise. And first, how did this movement come to take place at all in the bosom of existence? If we suppose it to be not only eternal but the very essence of all existence, the question does not arise. But we have negated

this theory. We are aware of an existence which is not compelled by the movement. How then does this movement alien to its eternal repose come to take place in it? by what cause? by what possibility? by what mysterious impulsion?

The answer most approved by the ancient Indian mind was that Force is inherent in Existence. Shiva and Kali, Brahman and Shakti are one and not two who are separable. Force inherent in existence may be at rest or it may be in motion, but when it is at rest, it exists none the less and is not abolished, diminished or in any way essentially altered. This reply is so entirely rational and in accordance with the nature of things that we need not hesitate to accept it. For it is impossible, because contradictory of reason, to suppose that Force is a thing alien to the one and infinite existence and entered into it from outside or was non-existent and arose in it at some point in Time. Even the Illusionist theory must admit that Maya, the power of self-illusion in Brahman, is potentially eternal in eternal Being and then the sole question is its manifestation or non-manifestation. The Sankhya also asserts the eternal coexistence of Prakriti and Purusha, Nature and Conscious-Soul, and the alternative states of rest or equilibrium of Prakriti and movement or disturbance of equilibrium.

But since Force is thus inherent in existence and it is the nature of Force to have this double or alternative potentiality of rest and movement, that is to say, of self-concentration in Force and self-diffusion in Force, the question of the how of the movement, its possibility, initiating impulsion or impelling cause does not arise. For we can easily, then, conceive that this potentiality must translate itself either as an alternative rhythm of rest and movement succeeding each other in Time or else as an eternal self-concentration of Force in immutable existence with a superficial play of movement, change and formation like the rising and falling of waves on the surface of the ocean. And this superficial play — we are necessarily speaking in inadequate images — may be either coeval with the self-concentration and itself also eternal or it may begin and end in Time and be resumed by a sort of constant rhythm; it is then not eternal in continuity but eternal in recurrence.

The problem of the how thus eliminated, there presents itself the question of the why. Why should this possibility of a play of movement of Force translate itself at all? why should not Force of existence remain eternally concentrated in itself, infinite, free from all variation and formation? This question also does not arise if we assume Existence to be non-conscious and consciousness only a development of material energy which we wrongly suppose to be immaterial. For then we can say simply that this rhythm is the nature of Force in existence and there is absolutely no reason to seek for a why, a cause, an initial motive or a final purpose for that which is in its nature eternally self-existent. We cannot put that question to eternal self-existence and ask it either why it exists or how it came into existence; neither can we put it to self-force of existence and its inherent nature of impulsion to movement. All that we can then inquire into is its manner of self-manifestation, its principles of movement and formation, its process of evolution. Both Existence and Force being inert,—inert status and inert impulsion,—both of them unconscious and unintelligent, there cannot be any purpose or final goal in evolution or any original cause or intention.

But if we suppose or find Existence to be conscious Being, the problem arises. We may indeed suppose a conscious Being which is subject to its nature of Force, compelled by it and without option as to whether it shall manifest in the universe or remain unmanifest. Such is the cosmic God of the Tantriks and the Mayavadins who is subject to Shakti or Maya, Purusha involved in Maya or controlled by Shakti. But it is obvious that such a God is not the supreme infinite Existence with which we have started. Admittedly, it is only a formulation of Brahman in the cosmos by the Brahman which is itself logically anterior to Shakti or Maya and takes her back into its transcendental being when she ceases from her works. In a conscious existence which is absolute, independent of its formations, not determined by its works, we must suppose an inherent freedom to manifest or not to manifest the potentiality of movement. A Brahman compelled by Prakriti is not Brahman, but an inert Infinite with an active

content in it more powerful than the continent, a conscious holder of Force of whom his Force is master. If we say that it is compelled by itself as Force, by its own nature, we do not get rid of the contradiction, the evasion of our first postulate. We have got back to an Existence which is really nothing but Force, Force at rest or in movement, absolute Force perhaps, but not absolute Being.

It is then necessary to examine into the relation between Force and Consciousness. But what do we mean by the latter term? Ordinarily we mean by it our first obvious idea of a mental waking consciousness such as is possessed by the human being during the major part of his bodily existence, when he is not asleep, stunned or otherwise deprived of his physical and superficial methods of sensation. In this sense it is plain enough that consciousness is the exception and not the rule in the order of the material universe. We ourselves do not always possess it. But this vulgar and shallow idea of the nature of consciousness, though it still colours our ordinary thought and associations, must now definitely disappear out of philosophical thinking. For we know that there is something in us which is conscious when we sleep, when we are stunned or drugged or in a swoon, in all apparently unconscious states of our physical being. Not only so, but we may now be sure that the old thinkers were right when they declared that even in our waking state what we call then our consciousness is only a small selection from our entire conscious being. It is a superficies, it is not even the whole of our mentality. Behind it, much vaster than it, there is a subliminal or subconscious mind which is the greater part of ourselves and contains heights and profundities which no man has yet measured or fathomed. This knowledge gives us a starting-point for the true science of Force and its workings; it delivers us definitely from circumscription by the material and from the illusion of the obvious.

Materialism indeed insists that, whatever the extension of consciousness, it is a material phenomenon inseparable from our physical organs and not their utiliser but their result. This orthodox contention, however, is no longer able to hold the

field against the tide of increasing knowledge. Its explanations are becoming more and more inadequate and strained. It is becoming always clearer that not only does the capacity of our total consciousness far exceed that of our organs, the senses, the nerves, the brain, but that even for our ordinary thought and consciousness these organs are only their habitual instruments and not their generators. Consciousness uses the brain which its upward strivings have produced, brain has not produced nor does it use the consciousness. There are even abnormal instances which go to prove that our organs are not entirely indispensable instruments,—that the heart-beats are not absolutely essential to life, any more than is breathing, nor the organised brain-cells to thought. Our physical organism no more causes or explains thought and consciousness than the construction of an engine causes or explains the motive-power of steam or electricity. The force is anterior, not the physical instrument.

Momentous logical consequences follow. In the first place we may ask whether, since even mental consciousness exists where we see inanimation and inertia, it is not possible that even in material objects a universal subconscious mind is present although unable to act or communicate itself to its surfaces for want of organs. Is the material state an emptiness of consciousness, or is it not rather only a sleep of consciousness—even though from the point of view of evolution an original and not an intermediate sleep? And by sleep the human example teaches us that we mean not a suspension of consciousness, but its gathering inward away from conscious physical response to the impacts of external things. And is not this what all existence is that has not yet developed means of outward communication with the external physical world? Is there not a Conscious Soul, a Purusha who wakes for ever even in all that sleeps?

We may go farther. When we speak of subconscious mind, we should mean by the phrase a thing not different from the outer mentality, but only acting below the surface, unknown to the waking man, in the same sense if perhaps with a deeper plunge and a larger scope. But the phenomena of the subliminal

self far exceed the limits of any such definition. It includes an action not only immensely superior in capacity, but quite different in kind from what we know as mentality in our waking self. We have therefore a right to suppose that there is a superconscient in us as well as a subconscious, a range of conscious faculties and therefore an organisation of consciousness which rise high above that psychological stratum to which we give the name of mentality. And since the subliminal self in us thus rises in superconsciousness above mentality, may it not also sink in subconsciousness below mentality? Are there not in us and in the world forms of consciousness which are submental, to which we can give the name of vital and physical consciousness? If so, we must suppose in the plant and the metal also a force to which we can give the name of consciousness although it is not the human or animal mentality for which we have hitherto preserved the monopoly of that description.

Not only is this probable but, if we will consider things dispassionately, it is certain. In ourselves there is such a vital consciousness which acts in the cells of the body and the automatic vital functions so that we go through purposeful movements and obey attractions and repulsions to which our mind is a stranger. In animals this vital consciousness is an even more important factor. In plants it is intuitively evident. The seekings and shrinkings of the plant, its pleasure and pain, its sleep and its wakefulness and all that strange life whose truth an Indian scientist has brought to light by rigidly scientific methods, are all movements of consciousness, but, as far as we can see, not of mentality. There is then a sub-mental, a vital consciousness which has precisely the same initial reactions as the mental, but is different in the constitution of its self-experience, even as that which is superconscient is in the constitution of its self-experience different from the mental being.

Does the range of what we can call consciousness cease with the plant, with that in which we recognise the existence of a sub-animal life? If so, we must then suppose that there is a force of life and consciousness originally alien to Matter which has yet entered into and occupied Matter,—perhaps from another

world.³ For whence, otherwise, can it have come? The ancient thinkers believed in the existence of such other worlds, which perhaps sustain life and consciousness in ours or even call it out by their pressure, but do not create it by their entry. Nothing can evolve out of Matter which is not therein already contained.

But there is no reason to suppose that the gamut of life and consciousness fails and stops short in that which seems to us purely material. The development of recent research and thought seems to point to a sort of obscure beginning of life and perhaps a sort of inert or suppressed consciousness in the metal and in the earth and in other "inanimate" forms, or at least the first stuff of what becomes consciousness in us may be there. Only while in the plant we can dimly recognise and conceive the thing that I have called vital consciousness, the consciousness of Matter, of the inert form, is difficult indeed for us to understand or imagine, and what we find it difficult to understand or imagine we consider it our right to deny. Nevertheless, when one has pursued consciousness so far into the depths, it becomes incredible that there should be this sudden gulf in Nature. Thought has a right to suppose a unity where that unity is confessed by all other classes of phenomena and in one class only, not denied, but merely more concealed than in others. And if we suppose the unity to be unbroken, we then arrive at the existence of consciousness in all forms of the Force which is at work in the world. Even if there be no conscient or superconscient Purusha inhabiting all forms, yet is there in those forms a conscious force of being of which even their outer parts overtly or inertly partake.

Necessarily, in such a view, the word consciousness changes its meaning. It is no longer synonymous with mentality but indicates a self-aware force of existence of which mentality is a middle term; below mentality it sinks into vital and material movements which are for us subconscious; above, it rises into

³ The curious speculation is now current that Life entered earth not from another world, but from another planet. To the thinker that would explain nothing. The essential question is how Life comes into Matter at all and not how it enters into the matter of a particular planet.

the supramental which is for us the superconscious. But in all it is one and the same thing organising itself differently. This is, once more, the Indian conception of Chit which, as energy, creates the worlds. Essentially, we arrive at that unity which materialistic Science perceives from the other end when it asserts that Mind cannot be another force than Matter, but must be merely development and outcome of material energy. Indian thought at its deepest affirms on the other hand that Mind and Matter are rather different grades of the same energy, different organisations of one conscious Force of Existence.

But what right have we to assume consciousness as the just description for this Force? For consciousness implies some kind of intelligence, purposefulness, self-knowledge, even though they may not take the forms habitual to our mentality. Even from this point of view everything supports rather than contradicts the idea of a universal conscious Force. We see, for instance, in the animal, operations of a perfect purposefulness and an exact, indeed a scientifically minute knowledge which are quite beyond the capacities of the animal mentality and which man himself can only acquire by long culture and education and even then uses with a much less sure rapidity. We are entitled to see in this general fact the proof of a conscious Force at work in the animal and the insect which is more intelligent, more purposeful, more aware of its intention, its ends, its means, its conditions than the highest mentality yet manifested in any individual form on earth. And in the operations of inanimate Nature we find the same pervading characteristic of a supreme hidden intelligence, "hidden in the modes of its own workings".

The only argument against a conscious and intelligent source for this purposeful work, this work of intelligence, of selection, adaptation and seeking is that large element in Nature's operations to which we give the name of waste. But obviously this is an objection based on the limitations of our human intellect which seeks to impose its own particular rationality, good enough for limited human ends, on the general operations of the World-Force. We see only part of Nature's purpose and all that does not subserve that part we call waste. Yet even our

own human action is full of an apparent waste, so appearing from the individual point of view, which yet, we may be sure, subserves well enough the large and universal purpose of things. That part of her intention which we can detect, Nature gets done surely enough in spite of, perhaps really by virtue of her apparent waste. We may well trust to her in the rest which we do not yet detect.

For the rest, it is impossible to ignore the drive of set purpose, the guidance of apparent blind tendency, the sure eventual or immediate coming to the target sought, which characterise the operations of World-Force in the animal, in the plant, in inanimate things. So long as Matter was Alpha and Omega to the scientific mind, the reluctance to admit intelligence as the mother of intelligence was an honest scruple. But now it is no more than an outworn paradox to affirm the emergence of human consciousness, intelligence and mastery out of an unintelligent, blindly driving unconsciousness in which no form or substance of them previously existed. Man's consciousness can be nothing else than a form of Nature's consciousness. It is there in other involved forms below Mind, it emerges in Mind, it shall ascend into yet superior forms beyond Mind. For the Force that builds the worlds is a conscious Force, the Existence which manifests itself in them is conscious Being and a perfect emergence of its potentialities in form is the sole object which we can rationally conceive for its manifestation of this world of forms.

Chapter XI

Delight of Existence: The Problem

For who could live or breathe if there were not this delight of existence as the ether in which we dwell?

From Delight all these beings are born, by Delight they exist and grow, to Delight they return.

Taittiriya Upanishad.¹

BUT EVEN if we accept this pure Existence, this Brahman, this Sat as the absolute beginning, end and continent of things and in Brahman an inherent self-consciousness inseparable from its being and throwing itself out as a force of movement of consciousness which is creative of forces, forms and worlds, we have yet no answer to the question “Why should Brahman, perfect, absolute, infinite, needing nothing, desiring nothing, at all throw out force of consciousness to create in itself these worlds of forms?” For we have put aside the solution that it is compelled by its own nature of Force to create, obliged by its own potentiality of movement and formation to move into forms. It is true that it has this potentiality, but it is not limited, bound or compelled by it; it is free. If, then, being free to move or remain eternally still, to throw itself into forms or retain the potentiality of form in itself, it indulges its power of movement and formation, it can be only for one reason, for delight.

This primary, ultimate and eternal Existence, as seen by the Vedantins, is not merely bare existence, or a conscious existence whose consciousness is crude force or power; it is a conscious existence the very term of whose being, the very term of whose consciousness is bliss. As in absolute existence there can be no

¹ II. 7; III. 6.

nothingness, no night of unconsciousness, no deficiency, that is to say, no failure of Force,—for if there were any of these things, it would not be absolute,—so also there can be no suffering, no negation of delight. Absoluteness of conscious existence is illimitable bliss of conscious existence; the two are only different phrases for the same thing. All illimitableness, all infinity, all absoluteness is pure delight. Even our relative humanity has this experience that all dissatisfaction means a limit, an obstacle,—satisfaction comes by realisation of something withheld, by the surpassing of the limit, the overcoming of the obstacle. This is because our original being is the absolute in full possession of its infinite and illimitable self-consciousness and self-power; a self-possession whose other name is self-delight. And in proportion as the relative touches upon that self-possession, it moves towards satisfaction, touches delight.

The self-delight of Brahman is not limited, however, by the still and motionless possession of its absolute self-being. Just as its force of consciousness is capable of throwing itself into forms infinitely and with an endless variation, so also its self-delight is capable of movement, of variation, of revelling in that infinite flux and mutability of itself represented by numberless teeming universes. To loose forth and enjoy this infinite movement and variation of its self-delight is the object of its extensive or creative play of Force.

In other words, that which has thrown itself out into forms is a triune Existence-Consciousness-Bliss, Sachchidananda, whose consciousness is in its nature a creative or rather a self-expressive Force capable of infinite variation in phenomenon and form of its self-conscious being and endlessly enjoying the delight of that variation. It follows that all things that exist are what they are as terms of that existence, terms of that conscious force, terms of that delight of being. Just as we find all things to be mutable forms of one immutable being, finite results of one infinite force, so we shall find that all things are variable self-expression of one invariable and all-embracing delight of self-existence. In everything that is, dwells the conscious force and it exists and is what it is by virtue of that conscious force; so also in everything

that is there is the delight of existence and it exists and is what it is by virtue of that delight.

This ancient Vedantic theory of cosmic origin is immediately confronted in the human mind by two powerful contradictions, the emotional and sensational consciousness of pain and the ethical problem of evil. For if the world be an expression of Sachchidananda, not only of existence that is conscious-force, —for that can easily be admitted,— but of existence that is also infinite self-delight, how are we to account for the universal presence of grief, of suffering, of pain? For this world appears to us rather as a world of suffering than as a world of the delight of existence. Certainly, that view of the world is an exaggeration, an error of perspective. If we regard it dispassionately and with a sole view to accurate and unemotional appreciation, we shall find that the sum of the pleasure of existence far exceeds the sum of the pain of existence,—appearances and individual cases to the contrary notwithstanding,—and that the active or passive, surface or underlying pleasure of existence is the normal state of nature, pain a contrary occurrence temporarily suspending or overlaying that normal state. But for that very reason the lesser sum of pain affects us more intensely and often looms larger than the greater sum of pleasure; precisely because the latter is normal, we do not treasure it, hardly even observe it unless it intensifies into some acuter form of itself, into a wave of happiness, a crest of joy or ecstasy. It is these things that we call delight and seek and the normal satisfaction of existence which is always there regardless of event and particular cause or object, affects us as something neutral which is neither pleasure nor pain. It is there, a great practical fact, for without it there would not be the universal and overpowering instinct of self-preservation, but it is not what we seek and therefore we do not enter it into our balance of emotional and sensational profit and loss. In that balance we enter only positive pleasures on one side and discomfort and pain on the other; pain affects us more intensely because it is abnormal to our being, contrary to our natural tendency and is experienced as an outrage on our existence, an offence and external attack on what we are and seek to be.

Nevertheless the abnormality of pain or its greater or lesser sum does not affect the philosophical issue; greater or less, its mere presence constitutes the whole problem. All being Sachchidananda, how can pain and suffering at all exist? This, the real problem, is often farther confused by a false issue starting from the idea of a personal extra-cosmic God and a partial issue, the ethical difficulty.

Sachchidananda, it may be reasoned, is God, is a conscious Being who is the author of existence; how then can God have created a world in which He inflicts suffering on His creatures, sanctions pain, permits evil? God being All-Good, who created pain and evil? If we say that pain is a trial and an ordeal, we do not solve the moral problem, we arrive at an immoral or non-moral God,—an excellent world-mechanist perhaps, a cunning psychologist, but not a God of Good and of Love whom we can worship, only a God of Might to whose law we must submit or whose caprice we may hope to propitiate. For one who invents torture as a means of test or ordeal, stands convicted either of deliberate cruelty or of moral insensibility and, if a moral being at all, is inferior to the highest instinct of his own creatures. And if to escape this moral difficulty, we say that pain is an inevitable result and natural punishment of moral evil,—an explanation which will not even square with the facts of life unless we admit the theory of Karma and rebirth by which the soul suffers now for antenatal sins in other bodies,—we still do not escape the very root of the ethical problem,—who created or why or whence was created that moral evil which entails the punishment of pain and suffering? And seeing that moral evil is in reality a form of mental disease or ignorance, who or what created this law or inevitable connection which punishes a mental disease or act of ignorance by a recoil so terrible, by tortures often so extreme and monstrous? The inexorable law of Karma is irreconcilable with a supreme moral and personal Deity, and therefore the clear logic of Buddha denied the existence of any free and all-governing personal God; all personality he declared to be a creation of ignorance and subject to Karma.

In truth, the difficulty thus sharply presented arises only if

we assume the existence of an extra-cosmic personal God, not Himself the universe, one who has created good and evil, pain and suffering for His creatures, but Himself stands above and unaffected by them, watching, ruling, doing His will with a suffering and struggling world or, if not doing His will, if allowing the world to be driven by an inexorable law, unhelped by Him or inefficiently helped, then not God, not omnipotent, not all-good and all-loving. On no theory of an extra-cosmic moral God, can evil and suffering be explained,—the creation of evil and suffering,—except by an unsatisfactory subterfuge which avoids the question at issue instead of answering it or a plain or implied Manicheanism which practically annuls the Godhead in attempting to justify its ways or excuse its works. But such a God is not the Vedantic Sachchidananda. Sachchidananda of the Vedanta is one existence without a second; all that is, is He. If then evil and suffering exist, it is He that bears the evil and suffering in the creature in whom He has embodied Himself. The problem then changes entirely. The question is no longer how came God to create for His creatures a suffering and evil of which He is Himself incapable and therefore immune, but how came the sole and infinite Existence-Consciousness-Bliss to admit into itself that which is not bliss, that which seems to be its positive negation.

Half of the moral difficulty —that difficulty in its one unanswerable form disappears. It no longer arises, can no longer be put. Cruelty to others, I remaining immune or even participating in their sufferings by subsequent repentance or belated pity, is one thing; self-infliction of suffering, I being the sole existence, is quite another. Still the ethical difficulty may be brought back in a modified form; All-Delight being necessarily all-good and all-love, how can evil and suffering exist in Sachchidananda, since he is not mechanical existence, but free and conscious being, free to condemn and reject evil and suffering? We have to recognise that the issue so stated is also a false issue because it applies the terms of a partial statement as if they were applicable to the whole. For the ideas of good and of love which we thus bring into the concept of the All-Delight spring from a dualistic

and divisional conception of things; they are based entirely on the relations between creature and creature, yet we persist in applying them to a problem which starts, on the contrary, from the assumption of One who is all. We have to see first how the problem appears or how it can be solved in its original purity, on the basis of unity in difference; only then can we safely deal with its parts and its developments, such as the relations between creature and creature on the basis of division and duality.

We have to recognise, if we thus view the whole, not limiting ourselves to the human difficulty and the human standpoint, that we do not live in an ethical world. The attempt of human thought to force an ethical meaning into the whole of Nature is one of those acts of wilful and obstinate self-confusion, one of those pathetic attempts of the human being to read himself, his limited habitual human self into all things and judge them from the standpoint he has personally evolved, which most effectively prevent him from arriving at real knowledge and complete sight. Material Nature is not ethical; the law which governs it is a co-ordination of fixed habits which take no cognisance of good and evil, but only of force that creates, force that arranges and preserves, force that disturbs and destroys impartially, non-ethically, according to the secret Will in it, according to the mute satisfaction of that Will in its own self-formations and self-dissolutions. Animal or vital Nature is also non-ethical, although as it progresses it manifests the crude material out of which the higher animal evolves the ethical impulse. We do not blame the tiger because it slays and devours its prey any more than we blame the storm because it destroys or the fire because it tortures and kills; neither does the conscious-force in the storm, the fire or the tiger blame or condemn itself. Blame and condemnation, or rather self-blame and self-condemnation, are the beginning of true ethics. When we blame others without applying the same law to ourselves, we are not speaking with a true ethical judgment, but only applying the language ethics has evolved for us to an emotional impulse of recoil from or dislike of that which displeases or hurts us.

This recoil or dislike is the primary origin of ethics, but is

not itself ethical. The fear of the deer for the tiger, the rage of the strong creature against its assailant is a vital recoil of the individual delight of existence from that which threatens it. In the progress of the mentality it refines itself into repugnance, dislike, disapproval. Disapproval of that which threatens and hurts us, approval of that which flatters and satisfies refine into the conception of good and evil to oneself, to the community, to others than ourselves, to other communities than ours, and finally into the general approval of good, the general disapproval of evil. But, throughout, the fundamental nature of the thing remains the same. Man desires self-expression, self-development, in other words, the progressing play in himself of the conscious-force of existence; that is his fundamental delight. Whatever hurts that self-expression, self-development, satisfaction of his progressing self, is for him evil; whatever helps, confirms, raises, aggrandises, ennobles it is his good. Only, his conception of the self-development changes, becomes higher and wider, begins to exceed his limited personality, to embrace others, to embrace all in its scope.

In other words, ethics is a stage in evolution. That which is common to all stages is the urge of Sachchidananda towards self-expression. This urge is at first non-ethical, then infra-ethical in the animal, then in the intelligent animal even anti-ethical for it permits us to approve hurt done to others which we disapprove when done to ourselves. In this respect man even now is only half-ethical. And just as all below us is infra-ethical, so there may be that above us whither we shall eventually arrive, which is supra-ethical, has no need of ethics. The ethical impulse and attitude, so all-important to humanity, is a means by which it struggles out of the lower harmony and universality based upon inconscience and broken up by Life into individual discords towards a higher harmony and universality based upon conscient oneness with all existences. Arriving at that goal, this means will no longer be necessary or even possible, since the qualities and oppositions on which it depends will naturally dissolve and disappear in the final reconciliation.

If, then, the ethical standpoint applies only to a temporary

though all-important passage from one universality to another, we cannot apply it to the total solution of the problem of the universe, but can only admit it as one element in that solution. To do otherwise is to run into the peril of falsifying all the facts of the universe, all the meaning of the evolution behind and beyond us in order to suit a temporary outlook and a half-evolved view of the utility of things. The world has three layers, infra-ethical, ethical and supra-ethical. We have to find that which is common to all; for only so can we resolve the problem.

That which is common to all is, we have seen, the satisfaction of conscious-force of existence developing itself into forms and seeking in that development its delight. From that satisfaction or delight of self-existence it evidently began; for it is that which is normal to it, to which it clings, which it makes its base; but it seeks new forms of itself and in the passage to higher forms there intervenes the phenomenon of pain and suffering which seems to contradict the fundamental nature of its being. This and this alone is the root-problem.

How shall we solve it? Shall we say that Sachchidananda is not the beginning and end of things, but the beginning and end is Nihil, an impartial void, itself nothing but containing all potentialities of existence or non-existence, consciousness or non-consciousness, delight or undelight? We may accept this answer if we choose; but although we seek thereby to explain everything, we have really explained nothing, we have only included everything. A Nothing which is full of all potentialities is the most complete opposition of terms and things possible and we have therefore only explained a minor contradiction by a major, by driving the self-contradiction of things to their maximum. Nihil is the void, where there can be no potentialities; an impartial indeterminate of all potentialities is Chaos, and all that we have done is to put Chaos into the Void without explaining how it got there. Let us return, then, to our original conception of Sachchidananda and see whether on that foundation a completer solution is not possible.

We must first make it clear to ourselves that just as when we speak of universal consciousness we mean something different

from, more essential and wider than the waking mental consciousness of the human being, so also when we speak of universal delight of existence we mean something different from, more essential and wider than the ordinary emotional and sensational pleasure of the individual human creature. Pleasure, joy and delight, as man uses the words, are limited and occasional movements which depend on certain habitual causes and emerge, like their opposites pain and grief which are equally limited and occasional movements, from a background other than themselves. Delight of being is universal, illimitable and self-existent, not dependent on particular causes, the background of all backgrounds, from which pleasure, pain and other more neutral experiences emerge. When delight of being seeks to realise itself as delight of becoming, it moves in the movement of force and itself takes different forms of movement of which pleasure and pain are positive and negative currents. Subconscious in Matter, superconscious beyond Mind this delight seeks in Mind and Life to realise itself by emergence in the becoming, in the increasing self-consciousness of the movement. Its first phenomena are dual and impure, move between the poles of pleasure and pain, but it aims at its self-revelation in the purity of a supreme delight of being which is self-existent and independent of objects and causes. Just as Sachchidananda moves towards the realisation of the universal existence in the individual and of the form-exceeding consciousness in the form of body and mind, so it moves towards the realisation of universal, self-existent and objectless delight in the flux of particular experiences and objects. Those objects we now seek as stimulating causes of a transient pleasure and satisfaction; free, possessed of self, we shall not seek but shall possess them as reflectors rather than causes of a delight which eternally exists.

In the egoistic human being, the mental person emergent out of the dim shell of matter, delight of existence is neutral, semi-latent, still in the shadow of the subconscious, hardly more than a concealed soil of plenty covered by desire with a luxuriant growth of poisonous weeds and hardly less poisonous flowers, the pains and pleasures of our egoistic existence. When the

divine conscious-force working secretly in us has devoured these growths of desire, when in the image of the Rig Veda the fire of God has burnt up the shoots of earth, that which is concealed at the roots of these pains and pleasures, their cause and secret being, the sap of delight in them, will emerge in new forms not of desire, but of self-existent satisfaction which will replace mortal pleasure by the Immortal's ecstasy. And this transformation is possible because these growths of sensation and emotion are in their essential being, the pains no less than the pleasures, that delight of existence which they seek but fail to reveal,—fail because of division, ignorance of self and egoism.

Chapter XII

Delight of Existence: The Solution

The name of That is the Delight; as the Delight we must worship and seek after It.

*Kena Upanishad.*¹

IN THIS conception of an inalienable underlying delight of existence of which all outward or surface sensations are a positive, negative or neutral play, waves and foamings of that infinite deep, we arrive at the true solution of the problem we are examining. The self of things is an infinite indivisible existence; of that existence the essential nature or power is an infinite imperishable force of self-conscious being; and of that self-consciousness the essential nature or knowledge of itself is, again, an infinite inalienable delight of being. In formlessness and in all forms, in the eternal awareness of infinite and indivisible being and in the multiform appearances of finite division this self-existence preserves perpetually its self-delight. As in the apparent inconscience of Matter our soul, growing out of its bondage to its own superficial habit and particular mode of self-conscious existence, discovers that infinite Conscious-Force constant, immobile, brooding, so in the apparent non-sensation of Matter it comes to discover and attune itself to an infinite conscious Delight imperturbable, ecstatic, all-embracing. This delight is its own delight, this self is its own self in all; but to our ordinary view of self and things which awakes and moves only upon surfaces, it remains hidden, profound, subconscious. And as it is within all forms, so it is within all experiences whether pleasant, painful or neutral. There too hidden, profound, subconscious, it is that which enables and compels things to remain in existence. It is the reason of that clinging to existence,

¹ IV. 6.

that overmastering will-to-be, translated vitally as the instinct of self-preservation, physically as the imperishability of matter, mentally as the sense of immortality which attends the formed existence through all its phases of self-development and of which even the occasional impulse of self-destruction is only a reverse form, an attraction to other state of being and a consequent recoil from present state of being. Delight is existence, Delight is the secret of creation, Delight is the root of birth, Delight is the cause of remaining in existence, Delight is the end of birth and that into which creation ceases. "From Ananda" says the Upanishad "all existences are born, by Ananda they remain in being and increase, to Ananda they depart."

As we look at these three aspects of essential Being, one in reality, triune to our mental view, separable only in appearance, in the phenomena of the divided consciousness, we are able to put in their right place the divergent formulae of the old philosophies so that they unite and become one, ceasing from their agelong controversy. For if we regard world-existence only in its appearances and only in its relation to pure, infinite, indivisible, immutable Existence, we are entitled to regard it, describe it and realise it as Maya. Maya in its original sense meant a comprehending and containing consciousness capable of embracing, measuring and limiting and therefore formative; it is that which outlines, measures out, moulds forms in the formless, psychologises and seems to make knowable the Unknowable, geometrises and seems to make measurable the limitless. Later the word came from its original sense of knowledge, skill, intelligence to acquire a pejorative sense of cunning, fraud or illusion, and it is in the figure of an enchantment or illusion that it is used by the philosophical systems.

World is Maya. World is not unreal in the sense that it has no sort of existence; for even if it were only a dream of the Self, still it would exist in It as a dream, real to It in the present even while ultimately unreal. Nor ought we to say that world is unreal in the sense that it has no kind of eternal existence; for although particular worlds and particular forms may or do dissolve physically and return mentally from the consciousness

of manifestation into the non-manifestation, yet Form in itself, World in itself are eternal. From the non-manifestation they return inevitably into manifestation; they have an eternal recurrence if not an eternal persistence, an eternal immutability in sum and foundation along with an eternal mutability in aspect and apparition. Nor have we any surety that there ever was or ever will be a period in Time when no form of universe, no play of being is represented to itself in the eternal Conscious-Being, but only an intuitive perception that the world that we know can and does appear from That and return into It perpetually.

Still world is Maya because it is not the essential truth of infinite existence, but only a creation of self-conscious being,—not a creation in the void, not a creation in nothing and out of nothing, but in the eternal Truth and out of the eternal Truth of that Self-being; its continent, origin and substance are the essential, real Existence, its forms are mutable formations of That to Its own conscious perception, determined by Its own creative conscious-force. They are capable of manifestation, capable of non-manifestation, capable of other-manifestation. We may, if we choose, call them therefore illusions of the infinite consciousness, thus audaciously flinging back a shadow of our mental sense of subjection to error and incapacity upon that which, being greater than Mind, is beyond subjection to falsehood and illusion. But seeing that the essence and substance of Existence is not a lie and that all errors and deformations of our divided consciousness represent some truth of the indivisible self-conscious Existence, we can only say that the world is not essential truth of That, but phenomenal truth of Its free multiplicity and infinite superficial mutability and not truth of Its fundamental and immutable Unity.

If, on the other hand, we look at world-existence in relation to consciousness only and to force of consciousness, we may regard, describe and realise it as a movement of Force obeying some secret will or else some necessity imposed on it by the very existence of the Consciousness that possesses or regards it. It is then the play of Prakriti, the executive Force, to satisfy Purusha, the regarding and enjoying Conscious-Being or it is the

play of Purusha reflected in the movements of Force and with them identifying himself. World, then, is the play of the Mother of things moved to cast Herself for ever into infinite forms and avid of eternally outpouring experiences.

Again if we look at World-Existence rather in its relation to the self-delight of eternally existent being, we may regard, describe and realise it as Lila, the play, the child's joy, the poet's joy, the actor's joy, the mechanician's joy of the Soul of things eternally young, perpetually inexhaustible, creating and re-creating Himself in Himself for the sheer bliss of that self-creation, of that self-representation,—Himself the play, Himself the player, Himself the playground. These three generalisations of the play of existence in its relation to the eternal and stable, the immutable Sachchidananda, starting from the three conceptions of Maya, Prakriti and Lila and representing themselves in our philosophical systems as mutually contradictory philosophies, are in reality perfectly consistent with each other, complementary and necessary in their totality to an integral view of life and the world. The world of which we are a part is in its most obvious view a movement of Force; but that Force, when we penetrate its appearances, proves to be a constant and yet always mutable rhythm of creative consciousness casting up, projecting in itself phenomenal truths of its own infinite and eternal being; and this rhythm is in its essence, cause and purpose a play of the infinite delight of being ever busy with its own innumerable self-representations. This triple or triune view must be the starting-point for all our understanding of the universe.

Since, then, eternal and immutable delight of being moving out into infinite and variable delight of becoming is the root of the whole matter, we have to conceive one indivisible conscious Being behind all our experiences supporting them by its inalienable delight and effecting by its movement the variations of pleasure, pain and neutral indifference in our sensational existence. That is our real self; the mental being subject to the triple vibration can only be a representation of our real self put in front for the purposes of that sensational experience of things which is the first rhythm of our divided consciousness in its response

and reaction to the multiple contacts of the universe. It is an imperfect response, a tangled and discordant rhythm preparing and preluding the full and unified play of the conscious Being in us; it is not the true and perfect symphony that may be ours if we can once enter into sympathy with the One in all variations and attune ourselves to the absolute and universal diapason.

If this view be right, then certain consequences inevitably impose themselves. In the first place, since in our depths we ourselves are that One, since in the reality of our being we are the indivisible All-Consciousness and therefore the inalienable All-Bliss, the disposition of our sensational experience in the three vibrations of pain, pleasure and indifference can only be a superficial arrangement created by that limited part of ourselves which is uppermost in our waking consciousness. Behind there must be something in us, — much vaster, profounder, truer than the superficial consciousness, — which takes delight impartially in all experiences; it is that delight which secretly supports the superficial mental being and enables it to persevere through all labours, sufferings and ordeals in the agitated movement of the Becoming. That which we call ourselves is only a trembling ray on the surface; behind is all the vast subconscious, the vast superconscious profiting by all these surface experiences and imposing them on its external self which it exposes as a sort of sensitive covering to the contacts of the world; itself veiled, it receives these contacts and assimilates them into the values of a truer, a profounder, a mastering and creative experience. Out of its depths it returns them to the surface in forms of strength, character, knowledge, impulsion whose roots are mysterious to us because our mind moves and quivers on the surface and has not learned to concentrate itself and live in the depths.

In our ordinary life this truth is hidden from us or only dimly glimpsed at times or imperfectly held and conceived. But if we learn to live within, we infallibly awaken to this presence within us which is our more real self, a presence profound, calm, joyous and puissant of which the world is not the master — a presence which, if it is not the Lord Himself, is the radiation of the Lord within. We are aware of it within supporting and helping the

apparent and superficial self and smiling at its pleasures and pains as at the error and passion of a little child. And if we can go back into ourselves and identify ourselves, not with our superficial experience, but with that radiant penumbra of the Divine, we can live in that attitude towards the contacts of the world and, standing back in our entire consciousness from the pleasures and pains of the body, vital being and mind, possess them as experiences whose nature being superficial does not touch or impose itself on our core and real being. In the entirely expressive Sanskrit terms, there is an *ānandamaya* behind the *manomaya*, a vast Bliss-Self behind the limited mental self, and the latter is only a shadowy image and disturbed reflection of the former. The truth of ourselves lies within and not on the surface.

Again this triple vibration of pleasure, pain, indifference, being superficial, being an arrangement and result of our imperfect evolution, can have in it no absoluteness, no necessity. There is no real obligation on us to return to a particular contact a particular response of pleasure, pain or neutral reaction, there is only an obligation of habit. We feel pleasure or pain in a particular contact because that is the habit our nature has formed, because that is the constant relation the recipient has established with the contact. It is within our competence to return quite the opposite response, pleasure where we used to have pain, pain where we used to have pleasure. It is equally within our competence to accustom the superficial being to return instead of the mechanical reactions of pleasure, pain and indifference that free reply of inalienable delight which is the constant experience of the true and vast Bliss-Self within us. And this is a greater conquest, a still deeper and more complete self-possession than a glad and detached reception in the depths of the habitual reactions on the surface. For it is no longer a mere acceptance without subjection, a free acquiescence in imperfect values of experience, but enables us to convert imperfect into perfect, false into true values,—the constant but veritable delight of the Spirit in things taking the place of the dualities experienced by the mental being.

In the things of the mind this pure habitual relativity of the

reactions of pleasure and pain is not difficult to perceive. The nervous being in us, indeed, is accustomed to a certain fixedness, a false impression of absoluteness in these things. To it victory, success, honour, good fortune of all kinds are pleasant things in themselves, absolutely, and must produce joy as sugar must taste sweet; defeat, failure, disappointment, disgrace, evil fortune of all kinds are unpleasant things in themselves, absolutely, and must produce grief as wormwood must taste bitter. To vary these responses is to it a departure from fact, abnormal and morbid; for the nervous being is a thing enslaved to habit and in itself the means devised by Nature for fixing constancy of reaction, sameness of experience, the settled scheme of man's relations to life. The mental being on the other hand is free, for it is the means she has devised for flexibility and variation, for change and progress; it is subject only so long as it chooses to remain subject, to dwell in one mental habit rather than in another or so long as it allows itself to be dominated by its nervous instrument. It is not bound to be grieved by defeat, disgrace, loss: it can meet these things and all things with a perfect indifference; it can even meet them with a perfect gladness. Therefore man finds that the more he refuses to be dominated by his nerves and body, the more he draws back from implication of himself in his physical and vital parts, the greater is his freedom. He becomes the master of his own responses to the world's contacts, no longer the slave of external touches.

In regard to physical pleasure and pain, it is more difficult to apply the universal truth; for this is the very domain of the nerves and the body, the centre and seat of that in us whose nature is to be dominated by external contact and external pressure. Even here, however, we have glimpses of the truth. We see it in the fact that according to the habit the same physical contact can be either pleasurable or painful, not only to different individuals, but to the same individual under different conditions or at different stages of his development. We see it in the fact that men in periods of great excitement or high exaltation remain physically indifferent to pain or unconscious of pain under contacts which ordinarily would inflict severe torture or suffering.

In many cases it is only when the nerves are able to reassert themselves and remind the mentality of its habitual obligation to suffer that the sense of suffering returns. But this return to the habitual obligation is not inevitable; it is only habitual. We see that in the phenomena of hypnosis not only can the hypnotised subject be successfully forbidden to feel the pain of a wound or puncture when in the abnormal state, but can be prevented with equal success from returning to his habitual reaction of suffering when he is awakened. The reason of this phenomenon is perfectly simple; it is because the hypnotiser suspends the habitual waking consciousness which is the slave of nervous habits and is able to appeal to the subliminal mental being in the depths, the inner mental being who is master, if he wills, of the nerves and the body. But this freedom which is effected by hypnosis abnormally, rapidly, without true possession, by an alien will, may equally be won normally, gradually, with true possession, by one's own will so as to effect partially or completely a victory of the mental being over the habitual nervous reactions of the body.

Pain of mind and body is a device of Nature, that is to say, of Force in her works, meant to subserve a definite transitional end in her upward evolution. The world is from the point of view of the individual a play and complex shock of multitudinous forces. In the midst of this complex play the individual stands as a limited constructed being with a limited amount of force exposed to numberless shocks which may wound, maim, break up or disintegrate the construction which he calls himself. Pain is in the nature of a nervous and physical recoil from a dangerous or harmful contact; it is a part of what the Upanishad calls *jugupsā*, the shrinking of the limited being from that which is not himself and not sympathetic or in harmony with himself, its impulse of self-defence against "others". It is, from this point of view, an indication by Nature of that which has to be avoided or, if not successfully avoided, has to be remedied. It does not come into being in the purely physical world so long as life does not enter into it; for till then mechanical methods are sufficient. Its office begins when life with its frailty and imperfect possession of

Matter enters on the scene; it grows with the growth of Mind in life. Its office continues so long as Mind is bound in the life and body which it is using, dependent upon them for its knowledge and means of action, subjected to their limitations and to the egoistic impulses and aims which are born of those limitations. But if and when Mind in man becomes capable of being free, unegoistic, in harmony with all other beings and with the play of the universal forces, the use and office of suffering diminishes, its *raison d'être* must finally cease to be and it can only continue as an atavism of Nature, a habit that has survived its use, a persistence of the lower in the as yet imperfect organisation of the higher. Its eventual elimination must be an essential point in the destined conquest of the soul over subjection to Matter and egoistic limitation in Mind.

This elimination is possible because pain and pleasure themselves are currents, one imperfect, the other perverse, but still currents of the delight of existence. The reason for this imperfection and this perversion is the self-division of the being in his consciousness by measuring and limiting Maya and in consequence an egoistic and piecemeal instead of a universal reception of contacts by the individual. For the universal soul all things and all contacts of things carry in them an essence of delight best described by the Sanskrit aesthetic term, *rasa*, which means at once sap or essence of a thing and its taste. It is because we do not seek the essence of the thing in its contact with us, but look only to the manner in which it affects our desires and fears, our cravings and shrinkings that grief and pain, imperfect and transient pleasure or indifference, that is to say, blank inability to seize the essence, are the forms taken by the Rasa. If we could be entirely disinterested in mind and heart and impose that detachment on the nervous being, the progressive elimination of these imperfect and perverse forms of Rasa would be possible and the true essential taste of the inalienable delight of existence in all its variations would be within our reach. We attain to something of this capacity for variable but universal delight in the aesthetic reception of things as represented by Art and Poetry, so that we enjoy there the Rasa or taste of the

sorrowful, the terrible, even the horrible or repellent;² and the reason is because we are detached, disinterested, not thinking of ourselves or of self-defence (*jugupsā*), but only of the thing and its essence. Certainly, this aesthetic reception of contacts is not a precise image or reflection of the pure delight which is supramental and supra-aesthetic; for the latter would eliminate sorrow, terror, horror and disgust with their cause while the former admits them: but it represents partially and imperfectly one stage of the progressive delight of the universal Soul in things in its manifestation and it admits us in one part of our nature to that detachment from egoistic sensation and that universal attitude through which the one Soul sees harmony and beauty where we divided beings experience rather chaos and discord. The full liberation can come to us only by a similar liberation in all our parts, the universal aesthesis, the universal standpoint of knowledge, the universal detachment from all things and yet sympathy with all in our nervous and emotional being.

Since the nature of suffering is a failure of the conscious-force in us to meet the shocks of existence and a consequent shrinking and contraction and its root is an inequality of that receptive and possessing force due to our self-limitation by egoism consequent on the ignorance of our true Self, of Sachchidananda, the elimination of suffering must first proceed by the substitution of *titiksā*, the facing, enduring and conquest of all shocks of existence for *jugupsā*, the shrinking and contraction: by this endurance and conquest we proceed to an equality which may be either an equal indifference to all contacts or an equal gladness in all contacts; and this equality again must find a firm foundation in the substitution of the Sachchidananda consciousness which is All-Bliss for the ego-consciousness which enjoys and suffers. The Sachchidananda consciousness may be transcendent of the universe and aloof from it, and to this state of distant Bliss the path is equal indifference; it is the path of the ascetic. Or the Sachchidananda consciousness may be at once transcendent and universal; and to this state of present and all-embracing

² So termed in Sanskrit Rhetoric, the *karuṇa*, *bhayānaka* and *bibhatsa* Rasas.

Bliss the path is surrender and loss of the ego in the universal and possession of an all-pervading equal delight; it is the path of the ancient Vedic sages. But neutrality to the imperfect touches of pleasure and the perverse touches of pain is the first direct and natural result of the soul's self-discipline and the conversion to equal delight can, usually, come only afterwards. The direct transformation of the triple vibration into Ananda is possible, but less easy to the human being.

Such then is the view of the universe which arises out of the integral Vedantic affirmation. An infinite, indivisible existence all-blissful in its pure self-consciousness moves out of its fundamental purity into the varied play of Force that is consciousness, into the movement of Prakriti which is the play of Maya. The delight of its existence is at first self-gathered, absorbed, subconscious in the basis of the physical universe; then emergent in a great mass of neutral movement which is not yet what we call sensation; then further emergent with the growth of mind and ego in the triple vibration of pain, pleasure and indifference originating from the limitation of the force of consciousness in the form and from its exposure to shocks of the universal Force which it finds alien to it and out of harmony with its own measure and standard; finally, the conscious emergence of the full Sachchidananda in its creations by universality, by equality, by self-possession and conquest of Nature. This is the course and movement of the world.

If it then be asked why the One Existence should take delight in such a movement, the answer lies in the fact that all possibilities are inherent in Its infinity and that the delight of existence — in its mutable becoming, not in its immutable being, — lies precisely in the variable realisation of its possibilities. And the possibility worked out here in the universe of which we are a part, begins from the concealment of Sachchidananda in that which seems to be its own opposite and its self-finding even amid the terms of that opposite. Infinite being loses itself in the appearance of non-being and emerges in the appearance of a finite Soul; infinite consciousness loses itself in the appearance of a vast indeterminate inconscience and emerges in the

appearance of a superficial limited consciousness; infinite self-sustaining Force loses itself in the appearance of a chaos of atoms and emerges in the appearance of the insecure balance of a world; infinite Delight loses itself in the appearance of an insensible Matter and emerges in the appearance of a discordant rhythm of varied pain, pleasure and neutral feeling, love, hatred and indifference; infinite unity loses itself in the appearance of a chaos of multiplicity and emerges in a discord of forces and beings which seek to recover unity by possessing, dissolving and devouring each other. In this creation the real Sachchidananda has to emerge. Man, the individual, has to become and to live as a universal being; his limited mental consciousness has to widen to the superconscious unity in which each embraces all; his narrow heart has to learn the infinite embrace and replace its lusts and discords by universal love and his restricted vital being to become equal to the whole shock of the universe upon it and capable of universal delight; his very physical being has to know itself as no separate entity but as one with and sustaining in itself the whole flow of the indivisible Force that is all things; his whole nature has to reproduce in the individual the unity, the harmony, the oneness-in-all of the supreme Existence-Consciousness-Bliss.

Through all this play the secret reality is always one and the same delight of existence,—the same in the delight of the subconscious sleep before the emergence of the individual, in the delight of the struggle and all the varieties, vicissitudes, perversions, conversions, reversions of the effort to find itself amid the mazes of the half-conscious dream of which the individual is the centre, and in the delight of the eternal superconscious self-possession into which the individual must wake and there become one with the indivisible Sachchidananda. This is the play of the One, the Lord, the All as it reveals itself to our liberated and enlightened knowledge from the conceptive standpoint of this material universe.

Chapter XIII

The Divine Maya

By the Names of the Lord and hers they shaped and measured
the force of the Mother of Light; wearing might after might
of that Force as a robe the lords of Maya shaped out Form in
this Being.

The Masters of Maya shaped all by His Maya; the Fathers
who have divine vision set Him within as a child that is to be
born.

Rig Veda.¹

EXISTENCE that acts and creates by the power and from the pure delight of its conscious being is the reality that we are, the self of all our modes and moods, the cause, object and goal of all our doing, becoming and creating. As the poet, artist or musician when he creates does really nothing but develop some potentiality in his unmanifested self into a form of manifestation and as the thinker, statesman, mechanist only bring out into a shape of things that which lay hidden in themselves, was themselves, is still themselves when it is cast into form, so is it with the world and the Eternal. All creation or becoming is nothing but this self-manifestation. Out of the seed there evolves that which is already in the seed, pre-existent in being, predestined in its will to become, prearranged in the delight of becoming. The original plasm held in itself in force of being the resultant organism. For it is always that secret, burdened, self-knowing force which labours under its own irresistible impulse to manifest the form of itself with which it is charged. Only, the individual who creates or develops out of himself, makes a distinction between himself, the force that

¹ III. 38. 7; IX. 83. 3.

works in him and the material in which he works. In reality the force is himself, the individualised consciousness which it instrumentalises is himself, the material which it uses is himself, the resultant form is himself. In other words it is one existence, one force, one delight of being which concentrates itself at various points, says of each "This is I" and works in it by a various play of self-force for a various play of self-formation.

What it produces is itself and can be nothing other than itself; it is working out a play, a rhythm, a development of its own existence, force of consciousness and delight of being. Therefore whatever comes into the world, seeks nothing but this, to be, to arrive at the intended form, to enlarge its self-existence in that form, to develop, manifest, increase, realise infinitely the consciousness and the power that is in it, to have the delight of coming into manifestation, the delight of the form of being, the delight of the rhythm of consciousness, the delight of the play of force and to aggrandise and perfect that delight by whatever means is possible, in whatever direction, through whatever idea of itself may be suggested to it by the Existence, the Conscious-Force, the Delight active within its deepest being.

And if there is any goal, any completeness towards which things tend, it can only be the completeness—in the individual and in the whole which the individuals constitute—of its self-existence, of its power and consciousness and of its delight of being. But such completeness is not possible in the individual consciousness concentrated within the limits of the individual formation; absolute completeness is not feasible in the finite because it is alien to the self-conception of the finite. Therefore the only final goal possible is the emergence of the infinite consciousness in the individual; it is his recovery of the truth of himself by self-knowledge and by self-realisation, the truth of the Infinite in being, the Infinite in consciousness, the Infinite in delight repossessed as his own Self and Reality of which the finite is only a mask and an instrument for various expression.

Thus by the very nature of the world-play as it has been realised by Sachchidananda in the vastness of His existence

extended as Space and Time, we have to conceive first of an involution and a self-absorption of conscious being into the density and infinite divisibility of substance, for otherwise there can be no finite variation; next, an emergence of the self-imprisoned force into formal being, living being, thinking being; and finally a release of the formed thinking being into the free realisation of itself as the One and the Infinite at play in the world and by the release its recovery of the boundless existence-consciousness-bliss that even now it is secretly, really and eternally. This triple movement is the whole key of the world-enigma.

It is so that the ancient and eternal truth of Vedanta receives into itself and illumines, justifies and shows us all the meaning of the modern and phenomenal truth of evolution in the universe. And it is so only that this modern truth of evolution which is the old truth of the Universal developing itself successively in Time, seen opaquely through the study of Force and Matter, can find its own full sense and justification,—by illuminating itself with the Light of the ancient and eternal truth still preserved for us in the Vedantic Scriptures. To this mutual self-discovery and self-illumination by the fusion of the old Eastern and the new Western knowledge the thought of the world is already turning.

Still, when we have found that all things are Sachchidananda, all has not yet been explained. We know the Reality of the universe, we do not yet know the process by which that Reality has turned itself into this phenomenon. We have the key of the riddle, we have still to find the lock in which it will turn. For this Existence, Conscious-Force, Delight does not work directly or with a sovereign irresponsibility like a magician building up worlds and universes by the mere fiat of its word. We perceive a process, we are aware of a Law.

It is true that this Law when we analyse it, seems to resolve itself into an equilibrium of the play of forces and a determination of that play into fixed lines of working by the accident of development and the habit of past realised energy. But this apparent and secondary truth is final to us only so long as we conceive of Force solely. When we perceive that Force is a self-expression of Existence, we are bound to perceive also that this

line which Force has taken, corresponds to some self-truth of that Existence which governs and determines its constant curve and destination. And since consciousness is the nature of the original Existence and the essence of its Force, this truth must be a self-perception in Conscious-Being and this determination of the line taken by Force must result from a power of self-directive knowledge inherent in Consciousness which enables it to guide its own Force inevitably along the logical line of the original self-perception. It is then a self-determining power in universal consciousness, a capacity in self-awareness of infinite existence to perceive a certain Truth in itself and direct its force of creation along the line of that Truth, which has presided over the cosmic manifestation.

But why should we interpose any special power or faculty between the infinite Consciousness itself and the result of its workings? May not this Self-awareness of the Infinite range freely creating forms which afterwards remain in play so long as there is not the fiat that bids them cease,—even as the old Semitic Revelation tells us, “God said, Let there be Light, and there was Light”? But when we say, “God said, Let there be Light”, we assume the act of a power of consciousness which determines light out of everything else that is not light; and when we say “and there was Light” we presume a directing faculty, an active power corresponding to the original perceptive power, which brings out the phenomenon and, working out Light according to the line of the original perception, prevents it from being overpowered by all the infinite possibilities that are other than itself. Infinite consciousness in its infinite action can produce only infinite results; to settle upon a fixed Truth or order of truths and build a world in conformity with that which is fixed, demands a selective faculty of knowledge commissioned to shape finite appearance out of the infinite Reality.

This power was known to the Vedic seers by the name of Maya. Maya meant for them the power of infinite consciousness to comprehend, contain in itself and measure out, that is to say, to form—for form is delimitation—Name and Shape out of the vast illimitable Truth of infinite existence. It is by Maya that

static truth of essential being becomes ordered truth of active being—or, to put it in more metaphysical language, out of the supreme being in which all is all without barrier of separative consciousness emerges the phenomenal being in which all is in each and each is in all for the play of existence with existence, consciousness with consciousness, force with force, delight with delight. This play of all in each and each in all is concealed at first from us by the mental play or the illusion of Maya which persuades each that he is in all but not all in him and that he is in all as a separated being not as a being always inseparably one with the rest of existence. Afterwards we have to emerge from this error into the supramental play or the truth of Maya where the “each” and the “all” coexist in the inseparable unity of the one truth and the multiple symbol. The lower, present and deluding mental Maya has first to be embraced, then to be overcome; for it is God’s play with division and darkness and limitation, desire and strife and suffering in which He subjects Himself to the Force that has come out of Himself and by her obscure suffers Himself to be obscured. That other Maya concealed by this mental has to be overpassed, then embraced; for it is God’s play of the infinities of existence, the splendours of knowledge, the glories of force mastered and the ecstasies of love illimitable where He emerges out of the hold of Force, holds her instead and fulfils in her illumined that for which she went out from Him at the first.

This distinction between the lower and the higher Maya is the link in thought and in cosmic Fact which the pessimistic and illusionist philosophies miss or neglect. To them the mental Maya, or perhaps an Overmind, is the creatrix of the world, and a world created by mental Maya would indeed be an inexplicable paradox and a fixed yet floating nightmare of conscious existence which could neither be classed as an illusion nor as a reality. We have to see that the mind is only an intermediate term between the creative governing knowledge and the soul imprisoned in its works. Sachchidananda, involved by one of His lower movements in the self-oblivious absorption of Force that is lost in the form of her own workings, returns towards Himself

out of the self-oblivion; Mind is only one of His instruments in the descent and the ascent. It is an instrument of the descending creation, not the secret creatrix,—a transitional stage in the ascent, not our high original source and the consummate term of cosmic existence.

The philosophies which recognise Mind alone as the creator of the worlds or accept an original principle with Mind as the only mediator between it and the forms of the universe, may be divided into the purely noumenal and the idealistic. The purely noumenal recognise in the cosmos only the work of Mind, Thought, Idea: but Idea may be purely arbitrary and have no essential relation to any real Truth of existence; such Truth, if it exists, may be regarded as a mere Absolute aloof from all relations and irreconcilable with a world of relations. The idealistic interpretation supposes a relation between the Truth behind and the conceptive phenomenon in front, a relation which is not merely that of an antinomy and opposition. The view I am presenting goes farther in idealism; it sees the creative Idea as Real-Idea, that is to say, a power of Conscious Force expressive of real being, born out of real being and partaking of its nature and neither a child of the Void nor a weaver of fictions. It is conscious Reality throwing itself into mutable forms of its own imperishable and immutable substance. The world is therefore not a figment of conception in the universal Mind, but a conscious birth of that which is beyond Mind into forms of itself. A Truth of conscious being supports these forms and expresses itself in them, and the knowledge corresponding to the truth thus expressed reigns as a supramental Truth-consciousness² organising real ideas in a perfect harmony before they are cast into the mental-vital-material mould. Mind, Life and Body are an inferior consciousness and a partial expression which strives to arrive in the mould of a various evolution at that superior expression of itself already existent to the Beyond-Mind. That which

² I take the phrase from the Rig Veda,—*rta-cit*, which means the consciousness of essential truth of being (*satyam*), of ordered truth of active being (*rtam*) and the vast self-awareness (*bṛhat*) in which alone this consciousness is possible.

is in the Beyond-Mind is the ideal which in its own conditions it is labouring to realise.

From our ascending point of view we may say that the Real is behind all that exists; it expresses itself intermediately in an Ideal which is a harmonised truth of itself; the Ideal throws out a phenomenal reality of variable conscious-being which, inevitably drawn towards its own essential Reality, tries at last to recover it entirely whether by a violent leap or normally through the Ideal which put it forth. It is this that explains the imperfect reality of human existence as seen by the Mind, the instinctive aspiration in the mental being towards a perfectibility ever beyond itself, towards the concealed harmony of the Ideal, and the supreme surge of the spirit beyond the ideal to the transcendental. The very facts of our consciousness, its constitution and its necessity presuppose such a triple order; they negate the dual and irreconcilable antithesis of a mere Absolute to a mere relativity.

Mind is not sufficient to explain existence in the universe. Infinite Consciousness must first translate itself into infinite faculty of Knowledge or, as we call it from our point of view, omniscience. But Mind is not a faculty of knowledge nor an instrument of omniscience; it is a faculty for the seeking of knowledge, for expressing as much as it can gain of it in certain forms of a relative thought and for using it towards certain capacities of action. Even when it finds, it does not possess; it only keeps a certain fund of current coin of Truth—not Truth itself—in the bank of Memory to draw upon according to its needs. For Mind is that which does not know, which tries to know and which never knows except as in a glass darkly. It is the power which interprets truth of universal existence for the practical uses of a certain order of things; it is not the power which knows and guides that existence and therefore it cannot be the power which created or manifested it.

But if we suppose an infinite Mind which would be free from our limitations, that at least might well be the creator of the universe? But such a Mind would be something quite different from the definition of mind as we know it: it would be something

beyond mentality; it would be the supramental Truth. An infinite Mind constituted in the terms of mentality as we know it could only create an infinite chaos, a vast clash of chance, accident, vicissitude wandering towards an indeterminate end after which it would be always tentatively groping and aspiring. An infinite, omniscient, omnipotent Mind would not be mind at all, but supramental knowledge.

Mind, as we know it, is a reflective mirror which receives presentations or images of a pre-existent Truth or Fact, either external to or at least vaster than itself. It represents to itself from moment to moment the phenomenon that is or has been. It possesses also the faculty of constructing in itself possible images other than those of the actual fact presented to it; that is to say, it represents to itself not only phenomenon that has been but also phenomenon that may be: it cannot, be it noted, represent to itself phenomenon that assuredly will be, except when it is an assured repetition of what is or has been. It has, finally, the faculty of forecasting new modifications which it seeks to construct out of the meeting of what has been and what may be, out of the fulfilled possibility and the unfulfilled, something that it sometimes succeeds in constructing more or less exactly, sometimes fails to realise, but usually finds cast into other forms than it forecasted and turned to other ends than it desired or intended.

An infinite Mind of this character might possibly construct an accidental cosmos of conflicting possibilities and it might shape it into something shifting, something always transient, something ever uncertain in its drift, neither real nor unreal, possessed of no definite end or aim but only an endless succession of momentary aims leading — since there is no superior directing power of knowledge — eventually nowhither. Nihilism or Illusionism or some kindred philosophy is the only logical conclusion of such a pure noumenalism. The cosmos so constructed would be a presentation or reflection of something not itself, but always and to the end a false presentation, a distorted reflection; all cosmic existence would be a Mind struggling to work out fully its imaginations, but not succeeding, because they

have no imperative basis of self-truth; overpowered and carried forward by the stream of its own past energies, it would be borne onward indeterminately for ever without issue unless or until it can either slay itself or fall into an eternal stillness. That traced to its roots is Nihilism and Illusionism and it is the only wisdom if we suppose that our human mentality or anything at all like it represents the highest cosmic force and the original conception at work in the universe.

But the moment we find in the original power of knowledge a higher force than that which is represented by our human mentality, this conception of the universe becomes insufficient and therefore invalid. It has its truth but it is not the whole truth. It is law of the immediate appearance of the universe, but not of its original truth and ultimate fact. For we perceive behind the action of Mind, Life and Body, something that is not embraced in the stream of Force but embraces and controls it; something that is not born into a world which it seeks to interpret, but has created in its being a world of which it has the omniscience; something that does not labour perpetually to form something else out of itself while it drifts in the overmastering surge of past energies it can no longer control, but has already in its consciousness a perfect Form of itself and is here gradually unfolding it. The world expresses a foreseen Truth, obeys a predetermining Will, realises an original formative self-vision, — it is the growing image of a divine creation.

So long as we work only through the mentality governed by appearances, this something beyond and behind and yet always immanent can be only an inference or a presence vaguely felt. We perceive a law of cyclic progress and infer an ever-increasing perfection of somewhat that is somewhere foreknown. For everywhere we see Law founded in self-being and, when we penetrate within into the rationale of its process, we find that Law is the expression of an innate knowledge, a knowledge inherent in the existence which is expressing itself and implied in the force that expresses it; and Law developed by Knowledge so as to allow of progression implies a divinely seen goal towards which the motion is directed. We see too that our reason seeks to

emerge out of and dominate the helpless drift of our mentality and we arrive at the perception that Reason is only a messenger, a representative or a shadow of a greater consciousness beyond itself which does not need to reason because it is all and knows all that it is. And we can then pass to the inference that this source of Reason is identical with the Knowledge that acts as Law in the world. This Knowledge determines its own law sovereignly because it knows what has been, is and will be and it knows because it is eternally, and infinitely cognises itself. Being that is infinite consciousness, infinite consciousness that is omnipotent force, when it makes a world—that is to say, a harmony of itself—its object of consciousness, becomes seizable by our thought as a cosmic existence that knows its own truth and realises in forms that which it knows.

But it is only when we cease to reason and go deep into ourselves, into that secrecy where the activity of mind is stilled, that this other consciousness becomes really manifest to us—however imperfectly owing to our long habit of mental reaction and mental limitation. Then we can know surely in an increasing illumination that which we had uncertainly conceived by the pale and flickering light of Reason. Knowledge waits seated beyond mind and intellectual reasoning, throned in the luminous vast of illimitable self-vision.

Chapter XIV

The Supermind as Creator

All things are self-deployings of the Divine Knowledge.

*Vishnu Purana.*¹

A PRINCIPLE of active Will and Knowledge superior to Mind and creatrix of the worlds is then the intermediary power and state of being between that self-possession of the One and this flux of the Many. This principle is not entirely alien to us; it does not belong solely and incommunicably to a Being who is entirely other than ourselves or to a state of existence from which we are mysteriously projected into birth, but also rejected and unable to return. If it seems to us to be seated on heights far above us, yet are they the heights of our own being and accessible to our tread. We can not only infer and glimpse that Truth, but we are capable of realising it. We may by a progressive expanding or a sudden luminous self-transcendence mount up to these summits in unforgettable moments or dwell on them during hours or days of greatest superhuman experience. When we descend again, there are doors of communication which we can keep always open or reopen even though they should constantly shut. But to dwell there permanently on this last and highest summit of the created and creative being is in the end the supreme ideal for our evolving human consciousness when it seeks not self-annulment but self-perfection. For, as we have seen, this is the original Idea and the final harmony and truth to which our gradual self-expression in the world returns and which it is meant to achieve.

Still, we may doubt whether it is possible, now or at all, to give any account of this state to the human intellect or to utilise

¹ II. 12. 39.

in any communicable and organisable way its divine workings for the elevation of our human knowledge and action. The doubt does not arise solely from the rarity or dubiety of any known phenomena that would betray a human working of this divine faculty, or from the remoteness which separates this action from the experience and verifiable knowledge of ordinary humanity; it is strongly suggested also by the apparent contradiction in both essence and operation between human mentality and the divine Supermind.

And certainly, if this consciousness had no relation at all to mind nor anywhere any identity with the mental being, it would be quite impossible to give any account of it to our human notions. Or, if it were in its nature only vision in knowledge and not at all dynamic power of knowledge, we could hope to attain by its contact a beatific state of mental illumination, but not a greater light and power for the works of the world. But since this consciousness is creatrix of the world, it must be not only state of knowledge, but power of knowledge, and not only a Will to light and vision, but a Will to power and works. And since Mind too is created out of it, Mind must be a development by limitation out of this primal faculty and this mediatory act of the supreme Consciousness and must therefore be capable of resolving itself back into it through a reverse development by expansion. For always Mind must be identical with Supermind in essence and conceal in itself the potentiality of Supermind, however different or even contrary it may have become in its actual forms and settled modes of operation. It may not then be an irrational or unprofitable attempt to strive by the method of comparison and contrast towards some idea of the Supermind from the standpoint and in the terms of our intellectual knowledge. The idea, the terms may well be inadequate and yet still serve as a finger of light pointing us onward on a way which to some distance at least we may tread. Moreover it is possible for Mind to rise beyond itself into certain heights or planes of consciousness which receive into themselves some modified light or power of the supramental consciousness and know that by an illumination, intuition or a direct contact or experience,

although to live in it and see and act from it is a victory that has not yet been made humanly possible.

And first we may pause a moment and ask ourselves whether no light can be found from the past which will guide us towards these ill-explored domains. We need a name, and we need a starting-point. For we have called this state of consciousness the Supermind; but the word is ambiguous since it may be taken in the sense of mind itself supereminent and lifted above ordinary mentality but not radically changed, or on the contrary it may bear the sense of all that is beyond mind and therefore assume a too extensive comprehensiveness which would bring in even the Ineffable itself. A subsidiary description is required which will more accurately limit its significance.

It is the cryptic verses of the Veda that help us here; for they contain, though concealed, the gospel of the divine and immortal Supermind and through the veil some illumining flashes come to us. We can see through these utterances the conception of this Supermind as a vastness beyond the ordinary firmaments of our consciousness in which truth of being is luminously one with all that expresses it and assures inevitably truth of vision, formulation, arrangement, word, act and movement and therefore truth also of result of movement, result of action and expression, infallible ordinance or law. Vast all-comprehensiveness; luminous truth and harmony of being in that vastness and not a vague chaos or self-lost obscurity; truth of law and act and knowledge expressive of that harmonious truth of being: these seem to be the essential terms of the Vedic description. The Gods, who in their highest secret entity are powers of this Supermind, born of it, seated in it as in their proper home, are in their knowledge "truth-conscious" and in their action possessed of the "seer-will". Their conscious-force turned towards works and creation is possessed and guided by a perfect and direct knowledge of the thing to be done and its essence and its law,—a knowledge which determines a wholly effective will-power that does not deviate or falter in its process or in its result, but expresses and fulfils spontaneously and inevitably in the act that which has been seen in the vision. Light is here one with Force, the

vibrations of knowledge with the rhythm of the will and both are one, perfectly and without seeking, groping or effort, with the assured result. The divine Nature has a double power, a spontaneous self-formulation and self-arrangement which wells naturally out of the essence of the thing manifested and expresses its original truth, and a self-force of light inherent in the thing itself and the source of its spontaneous and inevitable self-arrangement.

There are subordinate, but important details. The Vedic seers seem to speak of two primary faculties of the "truth-conscious" soul; they are Sight and Hearing, by which is intended direct operations of an inherent Knowledge describable as truth-vision and truth-audition and reflected from far-off in our human mentality by the faculties of revelation and inspiration. Besides, a distinction seems to be made in the operations of the Supermind between knowledge by a comprehending and pervading consciousness which is very near to subjective knowledge by identity and knowledge by a projecting, confronting, apprehending consciousness which is the beginning of objective cognition. These are the Vedic clues. And we may accept from this ancient experience the subsidiary term "truth-consciousness" to delimit the connotation of the more elastic phrase, Supermind.

We see at once that such a consciousness, described by such characteristics, must be an intermediate formulation which refers back to a term above it and forward to another below it; we see at the same time that it is evidently the link and means by which the inferior develops out of the superior and should equally be the link and means by which it may develop back again towards its source. The term above is the unitarian or indivisible consciousness of pure Sachchidananda in which there are no separating distinctions; the term below is the analytic or dividing consciousness of Mind which can only know by separation and distinction and has at the most a vague and secondary apprehension of unity and infinity,—for, though it can synthetise its divisions, it cannot arrive at a true totality. Between them is this comprehensive and creative consciousness, by its

power of pervading and intimately comprehending knowledge the child of that self-awareness by identity which is the poise of the Brahman and by its power of projecting, confronting, apprehending knowledge parent of that awareness by distinction which is the process of the Mind.

Above, the formula of the One eternally stable and immutable; below, the formula of the Many which, eternally mutable, seeks but hardly finds in the flux of things a firm and immutable standing-point; between, the seat of all trinities, of all that is biune, of all that becomes Many-in-One and yet remains One-in-Many because it was originally One that is always potentially Many. This intermediary term is therefore the beginning and end of all creation and arrangement, the Alpha and the Omega, the starting-point of all differentiation, the instrument of all unification, originative, executive and consummative of all realised or realisable harmonies. It has the knowledge of the One, but is able to draw out of the One its hidden multitudes; it manifests the Many, but does not lose itself in their differentiations. And shall we not say that its very existence points back to Something beyond our supreme perception of the ineffable Unity,—Something ineffable and mentally inconceivable not because of its unity and indivisibility, but because of its freedom from even these formulations of our mind,—Something beyond both unity and multiplicity? That would be the utter Absolute and Real which yet justifies to us both our knowledge of God and our knowledge of the world.

But these terms are large and difficult to grasp; let us come to precisions. We speak of the One as Sachchidananda; but in the very description we posit three entities and unite them to arrive at a trinity. We say “Existence, Consciousness, Bliss”, and then we say, “they are one”. It is a process of the mind. But for the unitarian consciousness such a process is inadmissible. Existence is Consciousness and there can be no distinction between them; Consciousness is Bliss and there can be no distinction between them. And since there is not even this differentiation, there can be no world. If that is the sole reality, then world is not and never existed, can never have been conceived; for indivisible

consciousness is undividing consciousness and cannot originate division and differentiation. But this is a *reductio ad absurdum*; we cannot admit it unless we are content to base everything upon an impossible paradox and an unreconciled antithesis.

On the other hand, Mind can conceive with precision divisions as real; it can conceive a synthetic totality or the finite extending itself indefinitely; it can grasp aggregates of divided things and the samenesses underlying them; but the ultimate unity and absolute infinity are to its conscience of things abstract notions and unseizable quantities, not something that is real to its grasp, much less something that is alone real. Here is therefore the very opposite term to the unitarian consciousness; we have, confronting the essential and indivisible unity, an essential multiplicity which cannot arrive at unity without abolishing itself and in the very act confessing that it could never really have existed. Yet it was; for it is this that has found unity and abolished itself. And again we have a *reductio ad absurdum* repeating the violent paradox which seeks to convince thought by stunning it and the irreconciled and irreconcilable antithesis.

The difficulty, in its lower term, disappears if we realise that Mind is only a preparatory form of our consciousness. Mind is an instrument of analysis and synthesis, but not of essential knowledge. Its function is to cut out something vaguely from the unknown Thing in itself and call this measurement or delimitation of it the whole, and again to analyse the whole into its parts which it regards as separate mental objects. It is only the parts and accidents that the Mind can see definitely and, after its own fashion, know. Of the whole its only definite idea is an assemblage of parts or a totality of properties and accidents. The whole not seen as a part of something else or in its own parts, properties and accidents is to the mind no more than a vague perception; only when it is analysed and put by itself as a separate constituted object, a totality in a larger totality, can Mind say to itself, "This now I know." And really it does not know. It knows only its own analysis of the object and the idea it has formed of it by a synthesis of the separate parts and properties that it has seen. There its characteristic power, its sure function ceases, and

if we would have a greater, a profounder and a real knowledge,—a knowledge and not an intense but formless sentiment such as comes sometimes to certain deep but inarticulate parts of our mentality,—Mind has to make room for another consciousness which will fulfil Mind by transcending it or reverse and so rectify its operations after leaping beyond it: the summit of mental knowledge is only a vaulting-board from which that leap can be taken. The utmost mission of Mind is to train our obscure consciousness which has emerged out of the dark prison of Matter, to enlighten its blind instincts, random intuitions, vague perceptions till it shall become capable of this greater light and this higher ascension. Mind is a passage, not a culmination.

On the other hand, the unitarian consciousness or indivisible Unity cannot be that impossible entity, a thing without contents out of which all contents have issued and into which they disappear and become annihilated. It must be an original self-concentration in which all is contained but in another manner than in this temporal and spatial manifestation. That which has thus concentrated itself, is the utterly ineffable and inconceivable Existence which the Nihilist images to his mind as the negative Void of all that we know and are but the Transcendentalist with equal reason may image to his mind as the positive but indistinguishable Reality of all that we know and are. “In the beginning,” says the Vedanta, “was the one Existence without a second,” but before and after the beginning, now, for ever and beyond Time is that which we cannot describe even as the One, even when we say that nothing but That is. What we can be aware of is, first, its original self-concentration which we endeavour to realise as the indivisible One; secondly, the diffusion and apparent disintegration of all that was concentrated in its unity which is the Mind’s conception of the universe; and thirdly, its firm self-extension in the Truth-consciousness which contains and upholds the diffusion and prevents it from being a real disintegration, maintains unity in utmost diversity and stability in utmost mutability, insists on harmony in the appearance of an all-pervading strife and collision, keeps eternal cosmos where Mind would arrive only at a chaos eternally attempting

to form itself. This is the Supermind, the Truth-consciousness, the Real-Idea which knows itself and all that it becomes.

Supermind is the vast self-extension of the Brahman that contains and develops. By the Idea it develops the triune principle of existence, consciousness and bliss out of their indivisible unity. It differentiates them, but it does not divide. It establishes a Trinity, not arriving like the Mind from the three to the One, but manifesting the three out of the One—for it manifests and develops—and yet maintaining them in the unity—for it knows and contains. By the differentiation it is able to bring forward one or other of them as the effective Deity which contains the others involved or explicit in itself and this process it makes the foundation of all other differentiations. And it acts by the same operation on all the principles and possibilities which it evolves out of this all-constituent trinity. It possesses the power of development, of evolution, of making explicit, and that power carries with it the other power of involution, of envelopment, of making implicit. In a sense, the whole of creation may be said to be a movement between two involutions, Spirit in which all is involved and out of which all evolves downward to the other pole of Matter, Matter in which also all is involved and out of which all evolves upward to the other pole of Spirit.

Thus the whole process of differentiation by the Real-Idea creative of the universe is a putting forward of principles, forces, forms which contain for the comprehending consciousness all the rest of existence within them and front the apprehending consciousness with all the rest of existence implicit behind them. Therefore all is in each as well as each in all. Therefore every seed of things implies in itself all the infinity of various possibilities, but is kept to one law of process and result by the Will, that is to say, by the Knowledge-Force of the Conscious-Being who is manifesting himself and who, sure of the Idea in himself, pre-determines by it his own forms and movements. The seed is the Truth of its own being which this Self-Existence sees in itself, the resultant of that seed of self-vision is the Truth of self-action, the natural law of development, formation and functioning which follows inevitably upon the self-vision and keeps to the processes

involved in the original Truth. All Nature is simply, then, the Seer-Will, the Knowledge-Force of the Conscious-Being at work to evolve in force and form all the inevitable truth of the Idea into which it has originally thrown itself.

This conception of the Idea points us to the essential contrast between our mental consciousness and the Truth-consciousness. We regard thought as a thing separate from existence, abstract, unsubstantial, different from reality, something which appears one knows not whence and detaches itself from objective reality in order to observe, understand and judge it; for so it seems and therefore is to our all-dividing, all-analysing mentality. The first business of Mind is to render "discrete", to make fissures much more than to discern, and so it has made this paralysing fissure between thought and reality. But in Supermind all being is consciousness, all consciousness is of being, and the idea, a pregnant vibration of consciousness, is equally a vibration of being pregnant of itself; it is an initial coming out, in creative self-knowledge, of that which lay concentrated in uncreative self-awareness. It comes out as Idea that is a reality, and it is that reality of the Idea which evolves itself, always by its own power and consciousness of itself, always self-conscious, always self-developing by the will inherent in the Idea, always self-realising by the knowledge ingrained in its every impulsion. This is the truth of all creation, of all evolution.

In Supermind being, consciousness of knowledge and consciousness of will are not divided as they seem to be in our mental operations; they are a trinity, one movement with three effective aspects. Each has its own effect. Being gives the effect of substance, consciousness the effect of knowledge, of the self-guiding and shaping idea, of comprehension and apprehension; will gives the effect of self-fulfilling force. But the idea is only the light of the reality illumining itself; it is not mental thought nor imagination, but effective self-awareness. It is Real-Idea.

In Supermind knowledge in the Idea is not divorced from will in the Idea, but one with it — just as it is not different from being or substance, but is one with the being, luminous power of the substance. As the power of burning light is not different from

the substance of the fire, so the power of the Idea is not different from the substance of the Being which works itself out in the Idea and its development. In our mentality all are different. We have an idea and a will according to the idea or an impulsion of will and an idea detaching itself from it; but we differentiate effectually the idea from the will and both from ourselves. I am; the idea is a mysterious abstraction that appears in me, the will is another mystery, a force nearer to concreteness, though not concrete, but always something that is not myself, something that I have or get or am seized with, but am not. I make a gulf also between my will, its means and the effect, for these I regard as concrete realities outside and other than myself. Therefore neither myself nor the idea nor the will in me are self-effective. The idea may fall away from me, the will may fail, the means may be lacking, I myself by any or all of these lacunae may remain unfulfilled.

But in the Supermind there is no such paralysing division, because knowledge is not self-divided, force is not self-divided, being is not self-divided as in the mind; they are neither broken in themselves, nor divorced from each other. For the Supermind is the Vast; it starts from unity, not division, it is primarily comprehensive, differentiation is only its secondary act. Therefore whatever be the truth of being expressed, the idea corresponds to it exactly, the will-force to the idea,—force being only power of the consciousness,—and the result to the will. Nor does the idea clash with other ideas, the will or force with other will or force as in man and his world; for there is one vast Consciousness which contains and relates all ideas in itself as its own ideas, one vast Will which contains and relates all energies in itself as its own energies. It holds back this, advances that other, but according to its own preconceiving Idea-Will.

This is the justification of the current religious notions of the omnipresence, omniscience and omnipotence of the Divine Being. Far from being an irrational imagination they are perfectly rational and in no way contradict either the logic of a comprehensive philosophy or the indications of observation and experience. The error is to make an unbridgeable gulf between

God and man, Brahman and the world. That error elevates an actual and practical differentiation in being, consciousness and force into an essential division. But this aspect of the question we shall touch upon afterwards. At present we have arrived at an affirmation and some conception of the divine and creative Supermind in which all is one in being, consciousness, will and delight, yet with an infinite capacity of differentiation that deploys but does not destroy the unity,—in which Truth is the substance and Truth rises in the Idea and Truth comes out in the form and there is one truth of knowledge and will, one truth of self-fulfilment and therefore of delight; for all self-fulfilment is satisfaction of being. Therefore, always, in all mutations and combinations a self-existent and inalienable harmony.

Chapter XV

The Supreme Truth-Consciousness

One seated in the sleep of Superconsciousness, a massed Intelligence, blissful and the enjoyer of Bliss. . . . This is the omnipotent, this is the omniscient, this is the inner control, this is the source of all.

Mandukya Upanishad.¹

WE HAVE to regard therefore this all-containing, all-originating, all-consummating Supermind as the nature of the Divine Being, not indeed in its absolute self-existence, but in its action as the Lord and Creator of its own worlds. This is the truth of that which we call God. Obviously this is not the too personal and limited Deity, the magnified and supernatural Man of the ordinary occidental conception; for that conception erects a too human Eidolon of a certain relation between the creative Supermind and the ego. We must not indeed exclude the personal aspect of the Deity, for the impersonal is only one face of existence; the Divine is All-existence, but it is also the one Existenter, — it is the sole Conscious-Being, but still a Being. Nevertheless, with this aspect we are not concerned at present; it is the impersonal psychological truth of the divine Consciousness that we are seeking to fathom: it is this that we have to fix in a large and clarified conception.

The Truth-Consciousness is everywhere present in the universe as an ordering self-knowledge by which the One manifests the harmonies of its infinite potential multiplicity. Without this ordering self-knowledge the manifestation would be merely a shifting chaos, precisely because the potentiality is infinite, — which by itself might lead only to a play of uncontrolled unbounded Chance. If there were only infinite potentiality without

¹ Verses 5, 6.

any law of guiding truth and harmonious self-vision, without any predetermining Idea in the very seed of things cast out for evolution, the world could be nothing but a teeming, amorphous, confused uncertainty. But the knowledge that creates, because what it creates or releases are forms and powers of itself and not things other than itself, possesses in its own being the vision of the truth and law that governs each potentiality, and along with that an intrinsic awareness of its relation to other potentialities and the harmonies that are possible between them; it holds all this prefigured in the general determining harmony which the whole rhythmic Idea of a universe must contain in its very birth and self-conception and which must therefore inevitably work out by the interplay of its constituents. It is the source and keeper of Law in the world; for that law is nothing arbitrary—it is the expression of a self-nature which is determined by the compelling truth of the real idea that each thing is in its inception. Therefore from the beginning the whole development is predetermined in its self-knowledge and at every moment in its self-working: it is what it must be at each moment by its own original inherent Truth; it moves to what it must be at the next, still by its own original inherent Truth; it will be at the end that which was contained and intended in its seed.

This development and progress of the world according to an original truth of its own being implies a succession of Time, a relation in Space and a regulated interaction of related things in Space to which the succession of Time gives the aspect of Causality. Time and Space, according to the metaphysician, have only a conceptual and not a real existence; but since all things and not these only are forms assumed by Conscious-Being in its own consciousness, the distinction is of no great importance. Time and Space are that one Conscious-Being viewing itself in extension, subjectively as Time, objectively as Space. Our mental view of these two categories is determined by the idea of measure which is inherent in the action of the analytical, dividing movement of Mind. Time is for the Mind a mobile extension measured out by the succession of the past, present and future in which Mind places itself at a certain standpoint whence it looks before

and after. Space is a stable extension measured out by divisibility of substance; at a certain point in that divisible extension Mind places itself and regards the disposition of substance around it.

In actual fact Mind measures Time by event and Space by Matter; but it is possible in pure mentality to disregard the movement of event and the disposition of substance and realise the pure movement of Conscious-Force which constitutes Space and Time; these two are then merely two aspects of the universal force of Consciousness which in their intertwined interaction comprehend the warp and woof of its action upon itself. And to a consciousness higher than Mind which should regard our past, present and future in one view, containing and not contained in them, not situated at a particular moment of Time for its point of prospection, Time might well offer itself as an eternal present. And to the same consciousness not situated at any particular point of Space, but containing all points and regions in itself, Space also might well offer itself as a subjective and indivisible extension,—no less subjective than Time. At certain moments we become aware of such an indivisible regard upholding by its immutable self-conscious unity the variations of the universe. But we must not now ask how the contents of Time and Space would present themselves there in their transcendent truth; for this our mind cannot conceive,—and it is even ready to deny to this Indivisible any possibility of knowing the world in any other way than that of our mind and senses.

What we have to realise and can to a certain extent conceive is the one view and all-comprehending regard by which the Supermind embraces and unifies the successions of Time and the divisions of Space. And first, if there were not this factor of the successions of Time, there would be no change or progression; a perfect harmony would be perpetually manifest, coeval with other harmonies in a sort of eternal moment, not successive to them in the movement from past to future. We have instead the constant succession of a developing harmony in which one strain rises out of another that preceded it and conceals in itself that which it has replaced. Or, if the self-manifestation were to exist without the factor of divisible Space, there would be

no mutable relation of forms or intershock of forces; all would exist and not be worked out,— a spaceless self-consciousness purely subjective would contain all things in an infinite subjective grasp as in the mind of a cosmic poet or dreamer, but would not distribute itself through all in an indefinite objective self-extension. Or again, if Time alone were real, its successions would be a pure development in which one strain would rise out of another in a subjective free spontaneity as in a series of musical sounds or a succession of poetical images. We have instead a harmony worked out by Time in terms of forms and forces that stand related to one another in an all-containing spatial extension; an incessant succession of powers and figures of things and happenings is our vision of existence.

Different potentialities are embodied, placed, related in this field of Time and Space, each with its powers and possibilities fronting other powers and possibilities, and as a result the successions of Time become in their appearance to the mind a working out of things by shock and struggle and not a spontaneous succession. In reality, there is a spontaneous working out of things from within and the external shock and struggle are only the superficial aspect of this elaboration. For the inner and inherent law of the one and whole, which is necessarily a harmony, governs the outer and processive laws of the parts or forms which appear to be in collision; and to the supramental vision this greater and profounder truth of harmony is always present. That which is an apparent discord to the mind because it considers each thing separately in itself, is an element of the general ever-present and ever-developing harmony to the Supermind because it views all things in a multiple unity. Besides, the mind sees only a given time and space and views many possibilities pell-mell as all more or less realisable in that time and space; the divine Supermind sees the whole extension of Time and Space and can embrace all the mind's possibilities and very many more not visible to the mind, but without any error, groping or confusion; for it perceives each potentiality in its proper force, essential necessity, right relation to the others and the time, place and circumstance both of its gradual and its

ultimate realisation. To see things steadily and see them whole is not possible to the mind; but it is the very nature of the transcendent Supermind.

This Supermind in its conscious vision not only contains all the forms of itself which its conscious force creates, but it pervades them as an indwelling Presence and a self-revealing Light. It is present, even though concealed, in every form and force of the universe; it is that which determines sovereignly and spontaneously form, force and functioning; it limits the variations it compels; it gathers, disperses, modifies the energy which it uses; and all this is done in accord with the first laws² that its self-knowledge has fixed in the very birth of the form, at the very starting-point of the force. It is seated within everything as the Lord in the heart of all existences,—he who turns them as on an engine by the power of his Maya;³ it is within them and embraces them as the divine Seer who variously disposed and ordained objects, each rightly according to the thing that it is, from years sempiternal.⁴

Each thing in Nature, therefore, whether animate or inanimate, mentally self-conscious or not self-conscious, is governed in its being and in its operations by an indwelling Vision and Power, to us subconscious or inconscient because we are not conscious of it, but not inconscient to itself, rather profoundly and universally conscient. Therefore each thing seems to do the works of intelligence, even without possessing intelligence, because it obeys, whether subconsciously as in the plant and animal or half-consciously as in man, the real-idea of the divine Supermind within it. But it is not a mental Intelligence that informs and governs all things; it is a self-aware Truth of being in which self-knowledge is inseparable from self-existence: it is this Truth-consciousness which has not to think out things but works them out with knowledge according to the impeccable self-vision and the inevitable force of a sole and self-fulfilling

² A Vedic expression. The gods act according to the first laws, original and therefore supreme, which are the law of the truth of things.

³ *Gita*, XVIII. 61.

⁴ *Isha Upanishad*, Verse 8.

Existence. Mental intelligence thinks out because it is merely a reflecting force of consciousness which does not know, but seeks to know; it follows in Time step by step the working of a knowledge higher than itself, a knowledge that exists always, one and whole, that holds Time in its grasp, that sees past, present and future in a single regard.

This, then, is the first operative principle of the divine Supermind; it is a cosmic vision which is all-comprehensive, all-pervading, all-inhabiting. Because it comprehends all things in being and static self-awareness, subjective, timeless, spaceless, therefore it comprehends all things in dynamic knowledge and governs their objective self-embodiment in Space and Time.

In this consciousness the knower, knowledge and the known are not different entities, but fundamentally one. Our mentality makes a distinction between these three because without distinctions it cannot proceed; losing its proper means and fundamental law of action, it becomes motionless and inactive. Therefore, even when I regard myself mentally, I have still to make this distinction. I am, as the knower; what I observe in myself, I regard as the object of my knowledge, myself yet not myself; knowledge is an operation by which I link the knower to the known. But the artificiality, the purely practical and utilitarian character of this operation is evident; it is evident that it does not represent the fundamental truth of things. In reality, I the knower am the consciousness which knows; the knowledge is that consciousness, myself, operating; the known is also myself, a form or movement of the same consciousness. The three are clearly one existence, one movement, indivisible though seeming to be divided, not distributed between its forms although appearing to distribute itself and to stand separate in each. But this is a knowledge which the mind can arrive at, can reason out, can feel, but cannot readily make the practical basis of its intelligent operations. And with regard to objects external to the form of consciousness which I call myself, the difficulty becomes almost insuperable; even to feel unity there is an abnormal effort and to retain it, to act upon it continually would be a new and foreign action not properly belonging to the Mind. Mind can at most

hold it as an understood truth so as to correct and modify by it its own normal activities which are still based upon division, somewhat as we know intellectually that the earth moves round the sun and are able to correct by it but not abolish the artificial and physically practical arrangement by which the senses persist in regarding the sun as in motion round the earth.

But the Supermind possesses and acts always, fundamentally, on this truth of unity which to the mind is only a secondary or acquired possession and not the very grain of its seeing. Supermind sees the universe and its contents as itself in a single indivisible act of knowledge, an act which is its life, which is the very movement of its self-existence. Therefore this comprehensive divine consciousness in its aspect of Will does not so much guide or govern the development of cosmic life as consummate it in itself by an act of power which is inseparable from the act of knowledge and from the movement of self-existence, is indeed one and the same act. For we have seen that universal force and universal consciousness are one — cosmic force is the operation of cosmic consciousness. So also divine Knowledge and divine Will are one; they are the same fundamental movement or act of existence.

This indivisibility of the comprehensive Supermind which contains all multiplicity without derogating from its own unity, is a truth upon which we have always to insist, if we are to understand the cosmos and get rid of the initial error of our analytic mentality. A tree evolves out of the seed in which it is already contained, the seed out of the tree; a fixed law, an invariable process reigns in the permanence of the form of manifestation which we call a tree. The mind regards this phenomenon, this birth, life and reproduction of a tree, as a thing in itself and on that basis studies, classes and explains it. It explains the tree by the seed, the seed by the tree; it declares a law of Nature. But it has explained nothing; it has only analysed and recorded the process of a mystery. Supposing even that it comes to perceive a secret conscious force as the soul, the real being of this form and the rest as merely a settled operation and manifestation of that force, still it tends to regard the form as a separate existence with

its separate law of nature and process of development. In the animal and in man with his conscious mentality this separative tendency of the Mind induces it to regard itself also as a separate existence, the conscious subject, and other forms as separate objects of its mentality. This useful arrangement, necessary to life and the first basis of all its practice, is accepted by the mind as an actual fact and thence proceeds all the error of the ego.

But the Supermind works otherwise. The tree and its process would not be what they are, could not indeed exist, if it were a separate existence; forms are what they are by the force of the cosmic existence, they develop as they do as a result of their relation to it and to all its other manifestations. The separate law of their nature is only an application of the universal law and truth of all Nature; their particular development is determined by their place in the general development. The tree does not explain the seed, nor the seed the tree; cosmos explains both and God explains cosmos. The Supermind, pervading and inhabiting at once the seed and the tree and all objects, lives in this greater knowledge which is indivisible and one though with a modified and not an absolute indivisibility and unity. In this comprehensive knowledge there is no independent centre of existence, no individual separated ego such as we see in ourselves; the whole of existence is to its self-awareness an equable extension, one in oneness, one in multiplicity, one in all conditions and everywhere. Here the All and the One are the same existence; the individual being does not and cannot lose the consciousness of its identity with all beings and with the One Being; for that identity is inherent in supramental cognition, a part of the supramental self-evidence.

In that spacious equality of oneness the Being is not divided and distributed; equally self-extended, pervading its extension as One, inhabiting as One the multiplicity of forms, it is everywhere at once the single and equal Brahman. For this extension of the Being in Time and Space and this pervasion and indwelling is in intimate relation with the absolute Unity from which it has proceeded, with that absolute Indivisible in which there is no centre or circumference but only the timeless and spaceless One.

That high concentration of unity in the unextended Brahman must necessarily translate itself in the extension by this equal pervasive concentration, this indivisible comprehension of all things, this universal undistributed immanence, this unity which no play of multiplicity can abrogate or diminish. "Brahman is in all things, all things are in Brahman, all things are Brahman" is the triple formula of the comprehensive Supermind, a single truth of self-manifestation in three aspects which it holds together and inseparably in its self-view as the fundamental knowledge from which it proceeds to the play of the cosmos.

But what then is the origin of mentality and the organisation of this lower consciousness in the triple terms of Mind, Life and Matter which is our view of the universe? For since all things that exist must proceed from the action of the all-efficient Supermind, from its operation in the three original terms of Existence, Conscious-Force and Bliss, there must be some faculty of the creative Truth-Consciousness which so operates as to cast them into these new terms, into this inferior trio of mentality, vitality and physical substance. This faculty we find in a secondary power of the creative knowledge, its power of a projecting, confronting and apprehending consciousness in which knowledge centralises itself and stands back from its works to observe them. And when we speak of centralisation, we mean, as distinguished from the equable concentration of consciousness of which we have hitherto spoken, an unequal concentration in which there is the beginning of self-division—or of its phenomenal appearance.

First of all, the Knower holds himself concentrated in knowledge as subject and regards his Force of consciousness as if continually proceeding from him into the form of himself, continually working in it, continually drawing back into himself, continually issuing forth again. From this single act of self-modification proceed all the practical distinctions upon which the relative view and the relative action of the universe is based. A practical distinction has been created between the Knower, Knowledge and the Known, between the Lord, His force and the children and works of the Force, between the Enjoyer, the

Enjoyment and the Enjoyed, between the Self, Maya and the becomings of the Self.

Secondly, this conscious Soul concentrated in knowledge, this Purusha observing and governing the Force that has gone forth from him, his Shakti or Prakriti, repeats himself in every form of himself. He accompanies, as it were, his Force of consciousness into its works and reproduces there the act of self-division from which this apprehending consciousness is born. In each form this Soul dwells with his Nature and observes himself in other forms from that artificial and practical centre of consciousness. In all it is the same Soul, the same divine Being; the multiplication of centres is only a practical act of consciousness intended to institute a play of difference, of mutuality, mutual knowledge, mutual shock of force, mutual enjoyment, a difference based upon essential unity, a unity realised on a practical basis of difference.

We can speak of this new status of the all-pervading Supermind as a further departure from the unitarian truth of things and from the indivisible consciousness which constitutes inalienably the unity essential to the existence of the cosmos. We can see that pursued a little farther it may become truly Avidya, the great Ignorance which starts from multiplicity as the fundamental reality and in order to travel back to real unity has to commence with the false unity of the ego. We can see also that once the individual centre is accepted as the determining standpoint, as the knower, mental sensation, mental intelligence, mental action of will and all their consequences cannot fail to come into being. But also we have to see that so long as the soul acts in the Supermind, Ignorance has not yet begun; the field of knowledge and action is still the truth-consciousness, the basis is still the unity.

For the Self still regards itself as one in all and all things as becomings in itself and of itself; the Lord still knows his Force as himself in act and every being as himself in soul and himself in form; it is still his own being that the Enjoyer enjoys, even though in a multiplicity. The one real change has been an unequal concentration of consciousness and a multiple distribution of force.

There is a practical distinction in consciousness, but there is no essential difference of consciousness or true division in its vision of itself. The Truth-consciousness has arrived at a position which prepares our mentality, but is not yet that of our mentality. And it is this that we must study in order to seize Mind at its origin, at the point where it makes its great lapse from the high and vast wideness of the Truth-consciousness into the division and the ignorance. Fortunately, this apprehending Truth-consciousness⁵ is much more facile to our grasp by its nearness to us, by its foreshadowing of our mental operations than the remoter realisation that we have hitherto been struggling to express in our inadequate language of the intellect. The barrier that has to be crossed is less formidable.

⁵ *prajñāna*.

Chapter XVI

The Triple Status of Supermind

My self is that which supports all beings and constitutes their existence. . . . I am the self which abides within all beings.

*Gita.*¹

Three powers of Light uphold three luminous worlds divine.

*Rig Veda.*²

BEFORE we pass to this easier understanding of the world we inhabit from the standpoint of an apprehending Truth-consciousness which sees things as would an individual soul freed from the limitations of mentality and admitted to participate in the action of the Divine Supermind, we must pause and resume briefly what we have realised or can yet realise of the consciousness of the Lord, the Ishwara as He develops the world by His Maya out of the original concentrated unity of His being.

We have started with the assertion of all existence as one Being whose essential nature is Consciousness, one Consciousness whose active nature is Force or Will; and this Being is Delight, this Consciousness is Delight, this Force or Will is Delight. Eternal and inalienable Bliss of Existence, Bliss of Consciousness, Bliss of Force or Will whether concentrated in itself and at rest or active and creative, this is God and this is ourselves in our essential, our non-phenomenal being. Concentrated in itself, it possesses or rather is the essential, eternal, inalienable Bliss; active and creative, it possesses or rather becomes the delight of the play of existence, the play of consciousness, the play of force and will. That play is the universe and that delight is the

¹ IX. 5; X. 20. ² V. 29. 1.

sole cause, motive and object of cosmic existence. The Divine Consciousness possesses that play and delight eternally and inalienably; our essential being, our real self which is concealed from us by the false self or mental ego, also enjoys that play and delight eternally and inalienably and cannot indeed do otherwise since it is one in being with the Divine Consciousness. If we aspire therefore to a divine life, we cannot attain to it by any other way than by unveiling this veiled self in us, by mounting from our present status in the false self or mental ego to a higher status in the true self, the Atman, by entering into that unity with the Divine Consciousness which something superconscient in us always enjoys,—otherwise we could not exist,—but which our conscious mentality has forfeited.

But when we thus assert this unity of Sachchidananda on the one hand and this divided mentality on the other, we posit two opposite entities one of which must be false if the other is to be held as true, one of which must be abolished if the other is to be enjoyed. Yet it is in the mind and its form of life and body that we exist on earth and, if we must abolish the consciousness of mind, life and body in order to reach the one Existence, Consciousness and Bliss, then a divine life here is impossible. We must abandon cosmic existence utterly as an illusion in order to enjoy or re-become the Transcendent. From this solution there is no escape unless there be an intermediate link between the two which can explain them to each other and establish between them such a relation as will make it possible for us to realise the one Existence, Consciousness, Delight in the mould of the mind, life and body.

The intermediate link exists. We call it the Supermind or the Truth-Consciousness, because it is a principle superior to mentality and exists, acts and proceeds in the fundamental truth and unity of things and not like the mind in their appearances and phenomenal divisions. The existence of the supermind is a logical necessity arising directly from the position with which we have started. For in itself Sachchidananda must be a spaceless and timeless absolute of conscious existence that is bliss; but the world is, on the contrary, an extension in Time and Space

and a movement, a working out, a development of relations and possibilities by causality—or what so appears to us—in Time and Space. The true name of this Causality is Divine Law and the essence of that Law is an inevitable self-development of the truth of the thing that is, as Idea, in the very essence of what is developed; it is a previously fixed determination of relative movements out of the stuff of infinite possibility. That which thus develops all things must be a Knowledge-Will or Conscious-Force; for all manifestation of universe is a play of the Conscious-Force which is the essential nature of existence. But the developing Knowledge-Will cannot be mental; for mind does not know, possess or govern this Law, but is governed by it, is one of its results, moves in the phenomena of the self-development and not at its root, observes as divided things the results of the development and strives in vain to arrive at their source and reality. Moreover this Knowledge-Will which develops all must be in possession of the unity of things and must out of it manifest their multiplicity; but mind is not in possession of that unity, it has only an imperfect possession of a part of the multiplicity.

Therefore there must be a principle superior to the Mind which satisfies the conditions in which Mind fails. No doubt, it is Sachchidananda itself that is this principle, but Sachchidananda not resting in its pure infinite invariable consciousness, but proceeding out of this primal poise, or rather upon it as a base and in it as a continent, into a movement which is its form of Energy and instrument of cosmic creation. Consciousness and Force are the twin essential aspects of the pure Power of existence; Knowledge and Will must therefore be the form which that Power takes in creating a world of relations in the extension of Time and Space. This Knowledge and this Will must be one, infinite, all-embracing, all-possessing, all-forming, holding eternally in itself that which it casts into movement and form. The Supermind then is Being moving out into a determinative self-knowledge which perceives certain truths of itself and wills to realise them in a temporal and spatial extension of its own timeless and spaceless existence. Whatever is in its own being,

takes form as self-knowledge, as Truth-Consciousness, as Real-Idea, and, that self-knowledge being also self-force, fulfils or realises itself inevitably in Time and Space.

This, then, is the nature of the Divine Consciousness which creates in itself all things by a movement of its conscious-force and governs their development through a self-evolution by inherent knowledge-will of the truth of existence or real-idea which has formed them. The Being that is thus conscient is what we call God; and He must obviously be omnipresent, omniscient, omnipotent. Omnipresent, for all forms are forms of His conscious being created by its force of movement in its own extension as Space and Time; omniscient, for all things exist in His conscious-being, are formed by it and possessed by it; omnipotent, for this all-possessing consciousness is also an all-possessing Force and all-informing Will. And this Will and Knowledge are not at war with each other as our will and knowledge are capable of being at war with each other, because they are not different but are one movement of the same being. Nor can they be contradicted by any other will, force or consciousness from outside or within; for there is no consciousness or force external to the One, and all energies and formations of knowledge within are not other than it, but are merely play of the one all-determining Will and the one all-harmonising Knowledge. What we see as a clash of wills and forces, because we dwell in the particular and divided and cannot see the whole, the Supermind envisages as the conspiring elements of a predetermined harmony which is always present to it because the totality of things is eternally subject to its gaze.

Whatever be the poise or form its action takes, this will always be the nature of the divine Consciousness. But, its existence being absolute in itself, its power of existence is also absolute in its extension, and it is not therefore limited to one poise or one form of action. We, human beings, are phenomenally a particular form of consciousness, subject to Time and Space, and can only be, in our surface consciousness which is all we know of ourselves, one thing at a time, one formation, one poise of being, one aggregate of experience; and that one thing is for us the truth of ourselves which we acknowledge; all the rest is either not true

or no longer true, because it has disappeared into the past out of our ken, or not yet true, because it is waiting in the future and not yet in our ken. But the Divine Consciousness is not so particularised, nor so limited; it can be many things at a time and take more than one enduring poise even for all time. We find that in the principle of Supermind itself it has three such general poises or sessions of its world-founding consciousness. The first founds the inalienable unity of things, the second modifies that unity so as to support the manifestation of the Many in One and One in Many; the third further modifies it so as to support the evolution of a diversified individuality which, by the action of Ignorance, becomes in us at a lower level the illusion of the separate ego.

We have seen what is the nature of this first and primary poise of the Supermind which founds the inalienable unity of things. It is not the pure unitarian consciousness; for that is a timeless and spaceless concentration of Sachchidananda in itself, in which Conscious Force does not cast itself out into any kind of extension and, if it contains the universe at all, contains it in eternal potentiality and not in temporal actuality. This, on the contrary, is an equal self-extension of Sachchidananda all-comprehending, all-possessing, all-constituting. But this all is one, not many; there is no individualisation. It is when the reflection of this Supermind falls upon our stilled and purified self that we lose all sense of individuality; for there is no concentration of consciousness there to support an individual development. All is developed in unity and as one; all is held by this Divine Consciousness as forms of its existence, not as in any degree separate existences. Somewhat as the thoughts and images that occur in our mind are not separate existences to us, but forms taken by our consciousness, so are all names and forms to this primary Supermind. It is the pure divine ideation and formation in the Infinite,—only an ideation and formation that is organised not as an unreal play of mental thought, but as a real play of conscious being. The divine soul in this poise would make no difference between Conscious-Soul and Force-Soul, for all force would be action of consciousness, nor between

Matter and Spirit since all mould would be simply form of Spirit.

In the second poise of the Supermind the Divine Consciousness stands back in the idea from the movement which it contains, realising it by a sort of apprehending consciousness, following it, occupying and inhabiting its works, seeming to distribute itself in its forms. In each name and form it would realise itself as the stable Conscious-Self, the same in all; but also it would realise itself as a concentration of Conscious-Self following and supporting the individual play of movement and upholding its differentiation from other play of movement, — the same everywhere in soul-essence, but varying in soul-form. This concentration supporting the soul-form would be the individual Divine or Jivatman as distinguished from the universal Divine or one all-constituting self. There would be no essential difference, but only a practical differentiation for the play which would not abrogate the real unity. The universal Divine would know all soul-forms as itself and yet establish a different relation with each separately and in each with all the others. The individual Divine would envisage its existence as a soul-form and soul-movement of the One and, while by the comprehending action of consciousness it would enjoy its unity with the One and with all soul-forms, it would also by a forward or frontal apprehending action support and enjoy its individual movement and its relations of a free difference in unity both with the One and with all its forms. If our purified mind were to reflect this secondary poise of Supermind, our soul could support and occupy its individual existence and yet even there realise itself as the One that has become all, inhabits all, contains all, enjoying even in its particular modification its unity with God and its fellows. In no other circumstance of the supramental existence would there be any characteristic change; the only change would be this play of the One that has manifested its multiplicity and of the Many that are still one, with all that is necessary to maintain and conduct the play.

A third poise of the Supermind would be attained if the supporting concentration were no longer to stand at the back, as it were, of the movement, inhabiting it with a certain superiority

to it and so following and enjoying, but were to project itself into the movement and to be in a way involved in it. Here, the character of the play would be altered, but only in so far as the individual Divine would so predominantly make the play of relations with the universal and with its other forms the practical field of its conscious experience that the realisation of utter unity with them would be only a supreme accompaniment and constant culmination of all experience; but in the higher poise unity would be the dominant and fundamental experience and variation would be only a play of the unity. This tertiary poise would be therefore that of a sort of fundamental blissful dualism in unity — no longer unity qualified by a subordinate dualism — between the individual Divine and its universal source, with all the consequences that would accrue from the maintenance and operation of such a dualism.

It may be said that the first consequence would be a lapse into the ignorance of Avidya which takes the Many for the real fact of existence and views the One only as a cosmic sum of the Many. But there would not necessarily be any such lapse. For the individual Divine would still be conscious of itself as the result of the One and of its power of conscious self-creation, that is to say, of its multiple self-concentration conceived so as to govern and enjoy manifoldly its manifold existence in the extension of Time and Space; this true spiritual Individual would not arrogate to itself an independent or separate existence. It would only affirm the truth of the differentiating movement along with the truth of the stable unity, regarding them as the upper and lower poles of the same truth, the foundation and culmination of the same divine play; and it would insist on the joy of the differentiation as necessary to the fullness of the joy of the unity.

Obviously, these three poises would be only different ways of dealing with the same Truth; the Truth of existence enjoyed would be the same, the way of enjoying it or rather the poise of the soul in enjoying it would be different. The delight, the Ananda would vary, but would abide always within the status of the Truth-consciousness and involve no lapse into the Falsehood and the Ignorance. For the secondary and tertiary

Supermind would only develop and apply in the terms of the divine multiplicity what the primary Supermind had held in the terms of the divine unity. We cannot stamp any of these three poises with the stigma of falsehood and illusion. The language of the Upanishads, the supreme ancient authority for these truths of a higher experience, when they speak of the Divine existence which is manifesting itself, implies the validity of all these experiences. We can only assert the priority of the oneness to the multiplicity, a priority not in time but in relation of consciousness, and no statement of supreme spiritual experience, no Vedantic philosophy denies this priority or the eternal dependence of the Many on the One. It is because in Time the Many seem not to be eternal but to manifest out of the One and return into it as their essence that their reality is denied; but it might equally be reasoned that the eternal persistence or, if you will, the eternal recurrence of the manifestation in Time is a proof that the divine multiplicity is an eternal fact of the Supreme beyond Time no less than the divine unity; otherwise it could not have this characteristic of inevitable eternal recurrence in Time.

It is indeed only when our human mentality lays an exclusive emphasis on one side of spiritual experience, affirms that to be the sole eternal truth and states it in the terms of our all-dividing mental logic that the necessity for mutually destructive schools of philosophy arises. Thus, emphasising the sole truth of the unitarian consciousness, we observe the play of the divine unity, erroneously rendered by our mentality into the terms of real difference, but, not satisfied with correcting this error of the mind by the truth of a higher principle, we assert that the play itself is an illusion. Or, emphasising the play of the One in the Many, we declare a qualified unity and regard the individual soul as a soul-form of the Supreme, but would assert the eternity of this qualified existence and deny altogether the experience of a pure consciousness in an unqualified oneness. Or, again, emphasising the play of difference, we assert that the Supreme and the human soul are eternally different and reject the validity of an experience which exceeds and seems to abolish that difference.

But the position that we have now firmly taken absolves us from the necessity of these negations and exclusions: we see that there is a truth behind all these affirmations, but at the same time an excess which leads to an ill-founded negation. Affirming, as we have done, the absolute absoluteness of That, not limited by our ideas of unity, not limited by our ideas of multiplicity, affirming the unity as a basis for the manifestation of the multiplicity and the multiplicity as the basis for the return to oneness and the enjoyment of unity in the divine manifestation, we need not burden our present statement with these discussions or undertake the vain labour of enslaving to our mental distinctions and definitions the absolute freedom of the Divine Infinite.

Chapter XVII

The Divine Soul

He whose self has become all existences, for he has the knowledge, how shall he be deluded, whence shall he have grief, he who sees everywhere oneness? *Isha Upanishad.*¹

BY THE conception we have formed of the Supermind, by its opposition to the mentality on which our human existence is based, we are able not only to form a precise instead of a vague idea of divinity and the divine life,—expressions which we are otherwise condemned to use with looseness and as the vague wording of a large but almost impalpable aspiration,—but also to give these ideas a firm basis of philosophical reasoning, to put them into a clear relation with the humanity and the human life which is all we at present enjoy and to justify our hope and aspiration by the very nature of the world and of our own cosmic antecedents and the inevitable future of our evolution. We begin to grasp intellectually what is the Divine, the eternal Reality, and to understand how out of it the world has come. We begin also to perceive how inevitably that which has come out of the Divine must return to the Divine. We may now ask with profit and a chance of clearer reply how we must change and what we must become in order to arrive there in our nature and our life and our relations with others and not only through a solitary and ecstatic realisation in the profundities of our being. Certainly, there is still a defect in our premisses; for we have so far been striving to define for ourselves what the Divine is in its descent towards limited Nature, whereas what we ourselves actually are is the Divine in the individual ascending back out of limited Nature

¹ Verse 7.

to its own proper divinity. This difference of movement must involve a difference between the life of the gods who have never known the fall and the life of man redeemed, conqueror of the lost godhead and bearing within him the experience and it may be the new riches gathered by him from his acceptance of the utter descent. Nevertheless, there can be no difference of essential characteristics, but only of mould and colouring. We can already ascertain on the basis of the conclusions at which we have arrived the essential nature of the divine life towards which we aspire.

What then would be the existence of a divine soul, not descended into the ignorance by the fall of Spirit into Matter and the eclipse of soul by material Nature? What would be its consciousness, living in the original Truth of things, in the inalienable unity, in the world of its own infinite being, like the Divine Existence itself, but able by the play of the Divine Maya and by the distinction of the comprehending and apprehending Truth-Consciousness to enjoy also difference from God at the same time as unity with Him and to embrace difference and yet oneness with other divine souls in the infinite play of the self-multiplied Identical?

Obviously, the existence of such a soul would be always self-contained in the conscious play of Sachchidananda. It would be pure and infinite self-existence in its being; in its becoming it would be a free play of immortal life uninvaded by death and birth and change of body because unclouded by ignorance and not involved in the darkness of our material being. It would be a pure and unlimited consciousness in its energy, poised in an eternal and luminous tranquillity as its foundation, yet able to play freely with forms of knowledge and forms of conscious power, tranquil, unaffected by the stumblings of mental error and the misprisions of our striving will because it never departs from truth and oneness, never falls from the inherent light and the natural harmony of its divine existence. It would be, finally, a pure and inalienable delight in its eternal self-experience and in Time a free variation of bliss unaffected by our perversions of dislike, hatred, discontent and suffering because undivided in

being, unbaffled by erring self-will, unperverted by the ignorant stimulus of desire.

Its consciousness would not be shut out from any part of the infinite truth, nor limited by any poise or status that it might assume in its relations with others, nor condemned to any loss of self-knowledge by its acceptance of a purely phenomenal individuality and the play of practical differentiation. It would in its self-experience live eternally in the presence of the Absolute. To us the Absolute is only an intellectual conception of indefinable existence. The intellect tells us simply that there is a Brahman higher than the highest,² an Unknowable that knows itself in other fashion than that of our knowledge; but the intellect cannot bring us into its presence. The divine soul living in the Truth of things would, on the contrary, always have the conscious sense of itself as a manifestation of the Absolute. Its immutable existence it would be aware of as the original "self-form"³ of that Transcendent,—Sachchidananda; its play of conscious being it would be aware of as manifestation of That in forms of Sachchidananda. In its every state or act of knowledge it would be aware of the Unknowable cognising itself by a form of variable self-knowledge; in its every state or act of power, will or force aware of the Transcendence possessing itself by a form of conscious power of being and knowledge; in its every state or act of delight, joy or love aware of the Transcendence embracing itself by a form of conscious self-enjoyment. This presence of the Absolute would not be with it as an experience occasionally glimpsed or finally arrived at and held with difficulty or as an addition, acquisition or culmination superimposed on its ordinary state of being: it would be the very foundation of its being both in the unity and the differentiation; it would be present to it in all its knowing, willing, doing, enjoying; it would be absent neither from its timeless self nor from any moment of Time, neither from its spaceless being nor from any determination of its extended existence, neither from its unconditioned purity

² *parātpara*.

³ *svarūpa*.

beyond all cause and circumstance nor from any relation of circumstance, condition and causality. This constant presence of the Absolute would be the basis of its infinite freedom and delight, ensure its security in the play and provide the root and sap and essence of its divine being.

Moreover such a divine soul would live simultaneously in the two terms of the eternal existence of Sachchidananda, the two inseparable poles of the self-unfolding of the Absolute which we call the One and the Many. All being does really so live; but to our divided self-awareness there is an incompatibility, a gulf between the two driving us towards a choice, to dwell either in the multiplicity exiled from the direct and entire consciousness of the One or in the unity repellent of the consciousness of the Many. But the divine soul would not be enslaved to this divorce and duality. It would be aware in itself at once of the infinite self-concentration and the infinite self-extension and diffusion. It would be aware simultaneously of the One in its unitarian consciousness holding the innumerable multiplicity in itself as if potential, unexpressed and therefore to our mental experience of that state non-existent, and of the One in its extended consciousness holding the multiplicity thrown out and active as the play of its own conscious being, will and delight. It would equally be aware of the Many ever drawing down to themselves the One that is the eternal source and reality of their existence and of the Many ever mounting up attracted to the One that is the eternal culmination and blissful justification of all their play of difference. This vast view of things is the mould of the Truth-Consciousness, the foundation of the large Truth and Right hymned by the Vedic seers; this unity of all these terms of opposition is the real Adwaita, the supreme comprehending word of the knowledge of the Unknowable.

The divine soul will be aware of all variation of being, consciousness, will and delight as the outflowing, the extension, the diffusion of that self-concentrated Unity developing itself, not into difference and division, but into another, an extended form of infinite oneness. It will itself always be concentrated in oneness in the essence of its being, always manifested in variation

in the extension of its being. All that takes form in itself will be the manifested potentialities of the One, the Word or Name vibrating out of the nameless Silence, the Form realising the formless essence, the active Will or Power proceeding out of the tranquil Force, the ray of self-cognition gleaming out from the sun of timeless self-awareness, the wave of becoming rising up into shape of self-conscious existence out of the eternally self-conscious Being, the joy and love welling for ever out of the eternal still Delight. It will be the Absolute biune in its self-unfolding, and each relativity in it will be absolute to itself because aware of itself as the Absolute manifested but without that ignorance which excludes other relativities as alien to its being or less complete than itself.

In the extension the divine soul will be aware of the three grades of the supramental existence, not as we are mentally compelled to regard them, not as grades, but as a triune fact of the self-manifestation of Sachchidananda. It will be able to embrace them in one and the same comprehensive self-realisation,—for a vast comprehensiveness is the foundation of the truth-conscious supermind. It will be able divinely to conceive, perceive and sense all things as the Self, its own self, one self of all, one Self-being and Self-becoming, but not divided in its becomings which have no existence apart from its own self-consciousness. It will be able divinely to conceive, perceive and sense all existences as soul-forms of the One which have each its own being in the One, its own standpoint in the One, its own relations with all the other existences that people the infinite unity, but all dependent on the One, conscious form of Him in His own infinity. It will be able divinely to conceive, perceive and sense all these existences in their individuality, in their separate standpoint living as the individual Divine, each with the One and Supreme dwelling in it and each therefore not altogether a form or eidolon, not really an illusory part of a real whole, a mere foaming wave on the surface of an immobile Ocean,—for these are after all no more than inadequate mental images,—but a whole in the whole, a truth that repeats the infinite Truth, a wave that is all the sea, a relative that proves to be

the Absolute itself when we look behind form and see it in its completeness.

For these three are aspects of the one Existence. The first is based upon that self-knowledge which, in our human realisation of the Divine, the Upanishad describes as the Self in us becoming all existences; the second on that which is described as seeing all existences in the Self; the third on that which is described as seeing the Self in all existences. The Self becoming all existences is the basis of our oneness with all; the Self containing all existences is the basis of our oneness in difference; the Self inhabiting all is the basis of our individuality in the universal. If the defect of our mentality, if its need of exclusive concentration compels it to dwell on any one of these aspects of self-knowledge to the exclusion of the others, if a realisation imperfect as well as exclusive moves us always to bring in a human element of error into the very Truth itself and of conflict and mutual negation into the all-comprehending unity, yet to a divine supramental being, by the essential character of the supermind which is a comprehending oneness and infinite totality, they must present themselves as a triple and indeed a triune realisation.

If we suppose this soul to take its poise, its centre in the consciousness of the individual Divine living and acting in distinct relation with the "others", still it will have in the foundation of its consciousness the entire unity from which all emerges and it will have in the background of that consciousness the extended and the modified unity and to any of these it will be capable of returning and of contemplating from them its individuality. In the Veda all these poised are asserted of the gods. In essence the gods are one existence which the sages call by different names; but in their action founded in and proceeding from the large Truth and Right Agni or another is said to be all the other gods, he is the One that becomes all; at the same time he is said to contain all the gods in himself as the nave of a wheel contains the spokes, he is the One that contains all; and yet as Agni he is described as a separate deity, one who helps all the others, exceeds them in force and knowledge, yet is inferior to them in cosmic position and is employed by them as messenger, priest

and worker,—the creator of the world and father, he is yet the son born of our works, he is, that is to say, the original and the manifested indwelling Self or Divine, the One that inhabits all.

All the relations of the divine soul with God or its supreme Self and with its other selves in other forms will be determined by this comprehensive self-knowledge. These relations will be relations of being, of consciousness and knowledge, of will and force, of love and delight. Infinite in their potentiality of variation, they need exclude no possible relation of soul with soul that is compatible with the preservation of the inalienable sense of unity in spite of every phenomenon of difference. Thus in its relations of enjoyment the divine soul will have the delight of all its own experience in itself; it will have the delight of all its experience of relation with others as a communion with other selves in other forms created for a varied play in the universe; it will have too the delight of the experiences of its other selves as if they were its own—as indeed they really are. And all this capacity it will have because it will be aware of its own experiences, of its relations with others and of the experiences of others and their relations with itself as all the joy or Ananda of the One, the supreme Self, its own self, differentiated by its separate habitation of all these forms comprehended in its own being but still one in difference. Because this unity is the basis of all its experience, it will be free from the discords of our divided consciousness, divided by ignorance and a separatist egoism; all these selves and their relations will play consciously into each other's hands; they will part and melt into each other as the numberless notes of an eternal harmony.

And the same rule will apply to the relations of its being, knowledge, will with the being, knowledge and will of others. For all its experience and delight will be the play of a self-blissful conscious force of being in which, by obedience to this truth of unity, will cannot be at strife with knowledge nor either of them with delight. Nor will the knowledge, will and delight of one soul clash with the knowledge, will and delight of another, because by their awareness of their unity what is clash and strife and discord in our divided being will be there the meeting, entwining and

mutual interplay of the different notes of one infinite harmony.

In its relations with its supreme Self, with God, the divine soul will have this sense of the oneness of the transcendent and universal Divine with its own being. It will enjoy that oneness of God with itself in its own individuality and with its other selves in the universality. Its relations of knowledge will be the play of the divine omniscience, for God is Knowledge, and what is ignorance with us will be there only the holding back of knowledge in the repose of conscious self-awareness so that certain forms of that self-awareness may be brought forward into activity of Light. Its relations of will will be there the play of the divine omnipotence, for God is Force, Will and Power, and what with us is weakness and incapacity will be the holding back of will in tranquil concentrated force so that certain forms of divine conscious-force may realise themselves brought forward into form of Power. Its relations of love and delight will be the play of the divine ecstasy, for God is Love and Delight, and what with us would be denial of love and delight will be the holding back of joy in the still sea of Bliss so that certain forms of divine union and enjoyment may be brought in front in an active upwelling of waves of the Bliss. So also all its becoming will be formation of the divine being in response to these activities and what is with us cessation, death, annihilation will be only rest, transition or holding back of the joyous creative Maya in the eternal being of Sachchidananda. At the same time this oneness will not preclude relations of the divine soul with God, with its supreme Self, founded on the joy of difference separating itself from unity to enjoy that unity otherwise; it will not annul the possibility of any of those exquisite forms of God-enjoyment which are the highest rapture of the God-lover in his clasp of the Divine.

But what will be the conditions in which and by which this nature of the life of the divine soul will realise itself? All experience in relation proceeds through certain forces of being formulating themselves by an instrumentation to which we give the name of properties, qualities, activities, faculties. As, for instance, Mind throws itself into various forms of mind-power, such as judgment, observation, memory, sympathy, proper to its

own being, so must the Truth-consciousness or Supermind effect the relations of soul with soul by forces, faculties, functionings proper to supramental being; otherwise there would be no play of differentiation. What these functionings are, we shall see when we come to consider the psychological conditions of the divine Life; at present we are only considering its metaphysical foundations, its essential nature and principles. Suffice it at present to observe that the absence or abolition of separatist egoism and of effective division in consciousness is the one essential condition of the divine Life, and therefore their presence in us is that which constitutes our mortality and our fall from the Divine. This is our “original sin”, or rather let us say in a more philosophical language, the deviation from the Truth and Right of the Spirit, from its oneness, integrality and harmony that was the necessary condition for the great plunge into the Ignorance which is the soul’s adventure in the world and from which was born our suffering and aspiring humanity.

Chapter XVIII

Mind and Supermind

He discovered that Mind was the Brahman.

*Taittiriya Upanishad.*¹

Indivisible, but as if divided in beings.

*Gita.*²

THE CONCEPTION which we have so far been striving to form is that of the essence only of the supramental life which the divine soul possesses securely in the being of Sachchidananda, but which the human soul has to manifest in this body of Sachchidananda formed here into the mould of a mental and physical living. But so far as we have been able yet to envisage this supramental existence, it does not seem to have any connection or correspondence with life as we know it, life active between the two terms of our normal existence, the two firmaments of mind and body. It seems rather to be a state of being, a state of consciousness, a state of active relation and mutual enjoyment such as disembodied souls might possess and experience in a world without physical forms, a world in which differentiation of souls had been accomplished but not differentiation of bodies, a world of active and joyous infinites, not of form-imprisoned spirits. Therefore it might reasonably be doubted whether such a divine living would be possible with this limitation of bodily form and this limitation of form-imprisoned mind and form-trammelled force which is what we now know as existence.

In fact, we have striven to arrive at some conception of that supreme infinite being, conscious-force and self-delight of which our world is a creation and our mentality a perverse

¹ III. 4. ² XIII. 17.

figure; we have tried to give ourselves an idea of what this divine Maya may be, this Truth-consciousness, this Real-Idea by which the conscious force of the transcendent and universal Existence conceives, forms and governs the universe, the order, the cosmos of its manifested delight of being. But we have not studied the connections of these four great and divine terms with the three others with which our human experience is alone familiar,—mind, life and body. We have not scrutinised this other and apparently undivine Maya which is the root of all our striving and suffering or seen how precisely it develops out of the divine reality or the divine Maya. And till we have done this, till we have woven the missing cords of connection, our world is still unexplained to us and the doubt of a possible unification between that higher existence and this lower life has still a basis. We know that our world has come forth from Sachchidananda and subsists in His being; we conceive that He dwells in it as the Enjoyer and Knower, Lord and Self; we have seen that our dual terms of sensation, mind, force, being can only be representations of His delight, His conscious force, His divine existence. But it would seem that they are actually so much the opposite of what He really and supernally is that we cannot while dwelling in the cause of these opposites, cannot while contained in the lower triple term of existence attain to the divine living. We must either exalt this lower being into that higher status or exchange body for that pure existence, life for that pure condition of conscious-force, sensation and mentality for that pure delight and knowledge which live in the truth of the spiritual reality. And must not this mean that we abandon all earthly or limited mental existence for something which is its opposite,—either for some pure state of the Spirit or else for some world of the Truth of things, if such exists, or other worlds, if such exist, of divine Bliss, divine Energy, divine Being? In that case the perfection of humanity is elsewhere than in humanity itself; the summit of its earthly evolution can only be a fine apex of dissolving mentality whence it takes the great leap either into formless being or into worlds beyond the reach of embodied Mind.

But in reality all that we call undivine can only be an action of the four divine principles themselves, such action of them as was necessary to create this universe of forms. Those forms have been created not outside but in the divine existence, conscious-force and bliss, not outside but in and as a part of the working of the divine Real-Idea. There is therefore no reason to suppose that there cannot be any real play of the higher divine consciousness in a world of forms or that forms and their immediate supports, mental consciousness, energy of vital force and formal substance, must necessarily distort that which they represent. It is possible, even probable that mind, body and life are to be found in their pure forms in the divine Truth itself, are there in fact as subordinate activities of its consciousness and part of the complete instrumentation by which the supreme Force always works. Mind, life and body must then be capable of divinity; their form and working in that short period out of possibly only one cycle of the terrestrial evolution which Science reveals to us, need not represent all the potential workings of these three principles in the living body. They work as they do because they are by some means separated in consciousness from the divine Truth from which they proceed. Were this separation once abrogated by the expanding energy of the Divine in humanity, their present functioning might well be converted, would indeed naturally be converted by a supreme evolution and progression into that purer working which they have in the Truth-consciousness.

In that case not only would it be possible to manifest and maintain the divine consciousness in the human mind and body but, even, that divine consciousness might in the end, increasing its conquests, remould mind, life and body themselves into a more perfect image of its eternal Truth and realise not only in soul but in substance its kingdom of heaven upon earth. The first of these victories, the internal, has certainly been achieved in a greater or less degree by some, perhaps by many, upon earth; the other, the external, even if never more or less realised in past aeons as a first type for future cycles and still held in the subconscious memory of the earth-nature, may yet be intended as a coming victorious achievement of God in humanity. This

earthly life need not be necessarily and for ever a wheel of half-joyous half-anguished effort; attainment may also be intended and the glory and joy of God made manifest upon earth.

What Mind, Life and Body are in their supreme sources and what therefore they must be in the integral completeness of the divine manifestation when informed by the Truth and not cut off from it by the separation and the ignorance in which presently we live,—this then is the problem that we have next to consider. For there they must have already their perfection towards which we here are growing,—we who are only the first shackled movement of the Mind which is evolving in Matter, we who are not yet liberated from the conditions and effects of that involution of spirit in form, that plunge of Light into its own shadow by which the darkened material consciousness of physical Nature was created. The type of all perfection towards which we grow, the terms of our highest evolution must already be held in the divine Real-Idea; they must be there formed and conscious for us to grow towards and into them: for that pre-existence in the divine knowledge is what our human mentality names and seeks as the Ideal. The Ideal is an eternal Reality which we have not yet realised in the conditions of our own being, not a non-existent which the Eternal and Divine has not yet grasped and only we imperfect beings have glimpsed and mean to create.

Mind, first, the chained and hampered sovereign of our human living. Mind in its essence is a consciousness which measures, limits, cuts out forms of things from the indivisible whole and contains them as if each were a separate integer. Even with what exists only as obvious parts and fractions, Mind establishes this fiction of its ordinary commerce that they are things with which it can deal separately and not merely as aspects of a whole. For, even when it knows that they are not things in themselves, it is obliged to deal with them as if they were things in themselves; otherwise it could not subject them to its own characteristic activity. It is this essential characteristic of Mind which conditions the workings of all its operative powers, whether conception, perception, sensation or the dealings of

creative thought. It conceives, perceives, senses things as if rigidly cut out from a background or a mass and employs them as fixed units of the material given to it for creation or possession. All its action and enjoyment deal thus with wholes that form part of a greater whole, and these subordinate wholes again are broken up into parts which are also treated as wholes for the particular purposes they serve. Mind may divide, multiply, add, subtract, but it cannot get beyond the limits of this mathematics. If it goes beyond and tries to conceive a real whole, it loses itself in a foreign element; it falls from its own firm ground into the ocean of the intangible, into the abysses of the infinite where it can neither perceive, conceive, sense nor deal with its subject for creation and enjoyment. For if Mind appears sometimes to conceive, to perceive, to sense or to enjoy with possession the infinite, it is only in seeming and always in a figure of the infinite. What it does thus vaguely possess is simply a formless Vast and not the real spaceless infinite. The moment it tries to deal with that, to possess it, at once the inalienable tendency to delimitation comes in and the Mind finds itself again handling images, forms and words. Mind cannot possess the infinite, it can only suffer it or be possessed by it; it can only lie blissfully helpless under the luminous shadow of the Real cast down on it from planes of existence beyond its reach. The possession of the Infinite cannot come except by an ascent to those supramental planes, nor the knowledge of it except by an inert submission of Mind to the descending messages of the Truth-conscious Reality.

This essential faculty and the essential limitation that accompanies it are the truth of Mind and fix its real nature and action, *svabhāva* and *svadharma*; here is the mark of the divine fiat assigning it its office in the complete instrumentation of the supreme Maya,—the office determined by that which it is in its very birth from the eternal self-conception of the Self-existent. That office is to translate always infinity into the terms of the finite, to measure off, limit, depiece. Actually it does this in our consciousness to the exclusion of all true sense of the Infinite; therefore Mind is the nodus of the great Ignorance, because

it is that which originally divides and distributes, and it has even been mistaken for the cause of the universe and for the whole of the divine Maya. But the divine Maya comprehends Vidya as well as Avidya, the Knowledge as well as the Ignorance. For it is obvious that since the finite is only an appearance of the Infinite, a result of its action, a play of its conception and cannot exist except by it, in it, with it as a background, itself form of that stuff and action of that force, there must be an original consciousness which contains and views both at the same time and is intimately conscious of all the relations of the one with the other. In that consciousness there is no ignorance, because the infinite is known and the finite is not separated from it as an independent reality; but still there is a subordinate process of delimitation,—otherwise no world could exist,—a process by which the ever dividing and reuniting consciousness of Mind, the ever divergent and convergent action of Life and the infinitely divided and self-aggregating substance of Matter come, all by one principle and original act, into phenomenal being. This subordinate process of the eternal Seer and Thinker, perfectly luminous, perfectly aware of Himself and all, knowing well what He does, conscious of the infinite in the finite which He is creating, may be called the divine Mind. And it is obvious that it must be a subordinate and not really a separate working of the Real-Idea, of the Supermind, and must operate through what we have described as the apprehending movement of the Truth-consciousness.

That apprehending consciousness, the Prajnana, places, as we have seen, the working of the indivisible All, active and formative, as a process and object of creative knowledge before the consciousness of the same All, originative and cognisant as the possessor and witness of its own working,—somewhat as a poet views the creations of his own consciousness placed before him in it as if they were things other than the creator and his creative force, yet all the time they are really no more than the play of self-formation of his own being in itself and are indivisible there from their creator. Thus Prajnana makes the fundamental division which leads to all the rest, the division of the Purusha,

the conscious soul who knows and sees and by his vision creates and ordains, and the Prakriti, the Force-Soul or Nature-Soul which is his knowledge and his vision, his creation and his all-ordaining power. Both are one Being, one existence, and the forms seen and created are multiple forms of that Being which are placed by Him as knowledge before Himself as knower, by Himself as Force before Himself as Creator. The last action of this apprehending consciousness takes place when the Purusha pervading the conscious extension of his being, present at every point of himself as well as in his totality, inhabiting every form, regards the whole as if separately, from each of the standpoints he has taken; he views and governs the relations of each soul-form of himself with other soul-forms from the standpoint of will and knowledge appropriate to each particular form.

Thus the elements of division have come into being. First, the infinity of the One has translated itself into an extension in conceptual Time and Space; secondly, the omnipresence of the One in that self-conscious extension translates itself into a multiplicity of the conscious soul, the many Purushas of the Sankhya; thirdly, the multiplicity of soul-forms has translated itself into a divided habitation of the extended unity. This divided habitation is inevitable the moment these multiple Purushas do not each inhabit a separate world of its own, do not each possess a separate Prakriti building a separate universe, but rather all enjoy the same Prakriti,—as they must do, being only soul-forms of the One presiding over the multiple creations of His power,—yet have relations with each other in the one world of being created by the one Prakriti. The Purusha in each form actively identifies himself with each; he delimits himself in that and sets off his other forms against it in his consciousness as containing his other selves which are identical with him in being but different in relation, different in the various extent, various range of movement and various view of the one substance, force, consciousness, delight which each is actually deploying at any given moment of Time or in any given field of Space. Granted that in the divine Existence, perfectly aware of itself, this is not a binding limitation, not an identification to which the soul

becomes enslaved and which it cannot exceed as we are enslaved to our self-identification with the body and unable to exceed the limitation of our conscious ego, unable to escape from a particular movement of our consciousness in Time determining our particular field in Space; granted all this, still there is a free identification from moment to moment which only the inalienable self-knowledge of the divine soul prevents from fixing itself in an apparently rigid chain of separation and Time succession such as that in which our consciousness seems to be fixed and chained.

Thus the depiecing is already there; the relation of form with form as if they were separate beings, of will-of-being with will-of-being as if they were separate forces, of knowledge-of-being with knowledge-of-being as if they were separate consciousnesses has already been founded. It is as yet only "as if"; for the divine soul is not deluded, it is aware of all as phenomenon of being and keeps hold of its existence in the reality of being; it does not forfeit its unity: it uses mind as a subordinate action of the infinite knowledge, a definition of things subordinate to its awareness of infinity, a delimitation dependent on its awareness of essential totality — not that apparent and pluralistic totality of sum and collective aggregation which is only another phenomenon of Mind. Thus there is no real limitation; the soul uses its defining power for the play of well-distinguished forms and forces and is not used by that power.

A new factor, a new action of conscious force is therefore needed to create the operation of a helplessly limited as opposed to a freely limiting mind, — that is to say, of mind subject to its own play and deceived by it as opposed to mind master of its own play and viewing it in its truth, the creature mind as opposed to the divine. That new factor is Avidya, the self-ignoring faculty which separates the action of mind from the action of the supermind that originated and still governs it from behind the veil. Thus separated, Mind perceives only the particular and not the universal, or conceives only the particular in an unpossessed universal and no longer both particular and universal as phenomena of the Infinite. Thus we have the limited mind which

views every phenomenon as a thing-in-itself, separate part of a whole which again exists separately in a greater whole and so on, enlarging always its aggregates without getting back to the sense of a true infinity.

Mind, being an action of the Infinite, depieces as well as aggregates *ad infinitum*. It cuts up being into wholes, into ever smaller wholes, into atoms and those atoms into primal atoms, until it would, if it could, dissolve the primal atom into nothingness. But it cannot, because behind this dividing action is the saving knowledge of the supramental which knows every whole, every atom to be only a concentration of all-force, of all-consciousness, of all-being into phenomenal forms of itself. The dissolution of the aggregate into an infinite nothingness at which Mind seems to arrive, is to the Supermind only the return of the self-concentrating conscious-being out of its phenomenon into its infinite existence. Whichever way its consciousness proceeds, by the way of infinite division or by the way of infinite enlargement, it arrives only at itself, at its own infinite unity and eternal being. And when the action of the mind is consciously subordinate to this knowledge of the supermind, the truth of the process is known to it also and not at all ignored; there is no real division but only an infinitely multiple concentration into forms of being and into arrangements of the relation of those forms of being to each other in which division is a subordinate appearance of the whole process necessary to their spatial and temporal play. For divide as you will, get down to the most infinitesimal atom or form the most monstrous possible aggregate of worlds and systems, you cannot get by either process to a thing-in-itself; all are forms of a Force which alone is real in itself while the rest are real only as self-imaginings or manifesting self-forms of the eternal Force-consciousness.

Whence then does the limiting Avidya, the fall of mind from Supermind and the consequent idea of real division originally proceed? exactly from what perversion of the supramental functioning? It proceeds from the individualised soul viewing everything from its own standpoint and excluding all others; it proceeds, that is to say, by an exclusive concentration of

consciousness, an exclusive self-identification of the soul with a particular temporal and spatial action which is only a part of its own play of being; it starts from the soul's ignoring the fact that all others are also itself, all other action its own action and all other states of being and consciousness equally its own as well as the action of the one particular moment in Time and one particular standing-point in Space and the one particular form it presently occupies. It concentrates on the moment, the field, the form, the movement so as to lose the rest; it has then to recover the rest by linking together the succession of moments, the succession of points of Space, the succession of forms in Time and Space, the succession of movements in Time and Space. It has thus lost the truth of the indivisibility of Time, the indivisibility of Force and Substance. It has lost sight even of the obvious fact that all minds are one Mind taking many standpoints, all lives one Life developing many currents of activity, all body and form one substance of Force and Consciousness concentrating into many apparent stabilities of force and consciousness; but in truth all these stabilities are really only a constant whorl of movement repeating a form while it modifies it; they are nothing more. For the Mind tries to clamp everything into rigidly fixed forms and apparently unchanging or unmoving external factors, because otherwise it cannot act; it then thinks it has got what it wants: in reality all is a flux of change and renewal and there is no fixed form-in-itself and no unchanging external factor. Only the eternal Real-Idea is firm and maintains a certain ordered constancy of figures and relations in the flux of things, a constancy which the Mind vainly attempts to imitate by attributing fixity to that which is always inconstant. These truths Mind has to rediscover; it knows them all the time, but only in the hidden back of its consciousness, in the secret light of its self-being; and that light is to it a darkness because it has created the ignorance, because it has lapsed from the dividing into the divided mentality, because it has become involved in its own workings and in its own creations.

This ignorance is farther deepened for man by his self-identification with the body. To us mind seems to be determined

by the body, because it is preoccupied with that and devoted to the physical workings which it uses for its conscious superficial action in this gross material world. Employing constantly that operation of the brain and nerves which it has developed in the course of its own development in the body, it is too absorbed in observing what this physical machinery gives to it to get back from it to its own pure workings; those are to it mostly subconscious. Still we can conceive a life mind or life being which has got beyond the evolutionary necessity of this absorption and is able to see and even experience itself assuming body after body and not created separately in each body and ending with it; for it is only the physical impress of mind on matter, only the corporeal mentality that is so created, not the whole mental being. This corporeal mentality is merely our surface of mind, merely the front which it presents to physical experience. Behind, even in our terrestrial being, there is this other, subconscious or subliminal to us, which knows itself as more than the body and is capable of a less materialised action. To this we owe immediately most of the larger, deeper and more forceful dynamic action of our surface mind; this, when we become conscious of it or of its impress on us, is our first idea or our first realisation of a soul or inner being, Purusha.³

But this life mentality also, though it may get free from the error of body, does not make us free from the whole error of mind; it is still subject to the original act of ignorance by which the individualised soul regards everything from its own standpoint and can see the truth of things only as they present themselves to it from outside or else as they rise up to its view from its separate temporal and spatial consciousness, forms and results of past and present experience. It is not conscious of its other selves except by the outward indications they give of their existence, indications of communicated thought, speech, action, result of actions, or subtler indications — not felt directly by the physical being — of vital impact and relation. Equally is it ignorant of itself; for it knows of its self only through a movement in

³ Perceived as the life being or vital being, *prāṇamaya puruṣa*.

Time and a succession of lives in which it has used its variously embodied energies. As our physical instrumental mind has the illusion of the body, so this subconscious dynamic mind has the illusion of life. In that it is absorbed and concentrated, by that it is limited, with that it identifies its being. Here we do not yet get back to the meeting-place of mind and supermind and the point at which they originally separated.

But there is still another clearer reflective mentality behind the dynamic and vital which is capable of escaping from this absorption in life and views itself as assuming life and body in order to image out in active relations of energy that which it perceives in will and thought. It is the source of the pure thinker in us; it is that which knows mentality in itself and sees the world not in terms of life and body but of mind; it is that⁴ which, when we get back to it, we sometimes mistake for the pure spirit as we mistake the dynamic mind for the soul. This higher mind is able to perceive and deal with other souls as other forms of its pure self; it is capable of sensing them by pure mental impact and communication and no longer only by vital and nervous impact and physical indication; it conceives too a mental figure of unity, and in its activity and its will it can create and possess more directly—not only indirectly as in the ordinary physical life—and in other minds and lives as well as its own. But still even this pure mentality does not escape from the original error of mind. For it is still its separate mental self which it makes the judge, witness and centre of the universe and through it alone strives to arrive at its own higher self and reality; all others are “others” grouped to it around itself: when it wills to be free, it has to draw back from life and mind in order to disappear into the real unity. For there is still the veil created by Avidya between the mental and supramental action; an image of the Truth gets through, not the Truth itself.

It is only when the veil is rent and the divided mind overpowered, silent and passive to a supramental action that mind itself gets back to the Truth of things. There we find a luminous

⁴ The mental being, *manomaya puruṣa*.

mentality reflective, obedient and instrumental to the divine Real-Idea. There we perceive what the world really is; we know in every way ourselves in others and as others, others as ourselves and all as the universal and self-multiplied One. We lose the rigidly separate individual standpoint which is the source of all limitation and error. Still, we perceive also that all that the ignorance of Mind took for the truth was in fact truth, but truth deflected, mistaken and falsely conceived. We still perceive the division, the individualising, the atomic creation, but we know them and ourselves for what they and we really are. And so we perceive that the Mind was really a subordinate action and instrumentation of the Truth-consciousness. So long as it is not separated in self-experience from the enveloping Master-consciousness and does not try to set up house for itself, so long as it serves passively as an instrumentation and does not attempt to possess for its own benefit, Mind fulfils luminously its function which is in the Truth to hold forms apart from each other by a phenomenal, a purely formal delimitation of their activity behind which the governing universality of the being remains conscious and untouched. It has to receive the truth of things and distribute it according to the unerring perception of a supreme and universal Eye and Will. It has to uphold an individualisation of active consciousness, delight, force, substance which derives all its power, reality and joy from an inalienable universality behind. It has to turn the multiplicity of the One into an apparent division by which relations are defined and held off against each other so as to meet again and join. It has to establish the delight of separation and contact in the midst of an eternal unity and intermischance. It has to enable the One to behave as if He were an individual dealing with other individuals but always in His own unity, and this is what the world really is. The mind is the final operation of the apprehending Truth-consciousness which makes all this possible, and what we call the Ignorance does not create a new thing and absolute falsehood but only misrepresents the Truth. The Ignorance is the Mind separated in knowledge from its source of knowledge and giving a false rigidity and a mistaken appearance of opposition and conflict

to the harmonious play of the supreme Truth in its universal manifestation.

The fundamental error of the Mind is, then, this fall from self-knowledge by which the individual soul conceives of its individuality as a separate fact instead of as a form of Oneness and makes itself the centre of its own universe instead of knowing itself as one concentration of the universal. From that original error all its particular ignorances and limitations are contingent results. For, viewing the flux of things only as it flows upon and through itself, it makes a limitation of being from which proceeds a limitation of consciousness and therefore of knowledge, a limitation of conscious force and will and therefore of power, a limitation of self-enjoyment and therefore of delight. It is conscious of things and knows them only as they present themselves to its individuality and therefore it falls into an ignorance of the rest and thereby into an erroneous conception even of that which it seems to know: for since all being is interdependent, the knowledge either of the whole or of the essence is necessary for the right knowledge of the part. Hence there is an element of error in all human knowledge. Similarly our will, ignorant of the rest of the all-will, must fall into error of working and a greater or less degree of incapacity and impotence; the soul's self-delight and delight of things, ignoring the all-bliss and by defect of will and knowledge unable to master its world, must fall into incapacity of possessive delight and therefore into suffering. Self-ignorance is therefore the root of all the perversity of our existence, and that perversity stands fortified in the self-limitation, the egoism which is the form taken by that self-ignorance.

Yet is all ignorance and all perversity only the distortion of the truth and right of things and not the play of an absolute falsehood. It is the result of Mind viewing things in the division it makes, *avidyāyām antare*, instead of viewing itself and its divisions as instrumentation and phenomenon of the play of the truth of Sachchidananda. If it gets back to the truth from which it fell, it becomes again the final action of the Truth-consciousness in its apprehensive operation, and the relations it helps to create in that light and power will be relations of the Truth and not

of the perversity. They will be the straight things and not the crooked, to use the expressive distinction of the Vedic Rishis, — Truths, that is to say, of divine being with its self-possessive consciousness, will and delight moving harmoniously in itself. Now we have rather the warped and zigzag movement of mind and life, the contortions created by the struggle of the soul once grown oblivious of its true being to find itself again, to resolve back all error into the truth which both our truth and our error, our right and our wrong limit or distort, all incapacity into the strength which both our power and our weakness are a struggle of force to grasp, all suffering into the delight which both our joy and our pain are a convulsive effort of sensation to realise, all death into the immortality to which both our life and our death are a constant effort of being to return.

Chapter XIX

Life

Pranic energy is the life of creatures; for that is said to be the universal principle of life. *Taittiriya Upanishad.*¹

WE PERCEIVE, then, what Mind is in its divine origin and how it is related to the Truth-consciousness,— Mind, the highest of the three lower principles which constitute our human existence. It is a special action of the divine consciousness, or rather it is the final strand of its whole creative action. It enables the Purusha to hold apart the relations of different forms and forces of himself to each other; it creates phenomenal differences which to the individual soul fallen from the Truth-consciousness take the appearance of radical divisions, and is by that original perversion the parent of all the resultant perversions which impress us as the contrary dualities and oppositions proper to the life of the Soul in the Ignorance. But so long as it is not separated from the Supermind, it supports, not perversions and falsehoods, but the various working of the universal Truth.

Mind thus appears as a creative cosmic agency. This is not the impression which we normally have of our mentality; rather we regard it primarily as a perceptive organ, perceptive of things already created by Force working in Matter, and the only origination we allow to it is a secondary creation of new combined forms from those already developed by Force in Matter. But the knowledge we are now recovering, aided by the last discoveries of Science, begins to show us that in this Force and in this Matter there is a subconscious Mind at work which is certainly responsible for its own emergence, first in the forms

¹ II. 3.

of life and secondly in the forms of mind itself, first in the nervous consciousness of plant-life and the primitive animal, secondly in the ever-developing mentality of the evolved animal and of man. And as we have already discovered that Matter is only substance-form of Force, so we shall discover that material Force is only energy-form of Mind. Material force is, in fact, a subconscious operation of Will; Will that works in us in what seems to be light, though it is in truth no more than a half-light, and material Force that works in what to us seems to be a darkness of unintelligence, are yet really and in essence the same, as materialistic thought has always instinctively felt from the wrong or lower end of things and as spiritual knowledge working from the summit had long ago discovered. We may say, therefore, that it is a subconscious Mind or Intelligence which, manifesting Force as its driving-power, its executive Nature, its Prakriti, has created this material world.

But since, as we have now found, Mind is no independent and original entity but only a final operation of the Truth-consciousness or Supermind, therefore wherever Mind is, there Supermind must be. Supermind or the Truth-consciousness is the real creative agency of the universal Existence. Even when Mind is in its own darkened consciousness separated from its source, yet is that larger movement always there in the workings of Mind; forcing them to preserve their right relation, evolving from them the inevitable results they bear in themselves, producing the right tree from the right seed, it compels even the operations of so brute, inert and darkened a thing as material Force to result in a world of Law, of order, of right relation and not, as it would otherwise be, of hurtling chance and chaos. Obviously, this order and right relation can only be relative and not the supreme order and supreme right which would reign if Mind were not in its own consciousness separated from Supermind; it is an arrangement, an order of the results right and proper to the action of dividing Mind and its creation of separative oppositions, its dual contrary sides of the one Truth. The Divine Consciousness, having conceived and thrown into operation the Idea of this dual or divided representation of Itself, deduces

from it in real-idea and educes practically from it in substance of life, by the governing action of the whole Truth-consciousness behind it, its own inferior truth or inevitable result of various relation. For this is the nature of Law or Truth in the world that it is the just working and bringing out of that which is contained in being, implied in the essence and nature of the thing itself, latent in its self-being and self-law, *svabhāva* and *svadharma*, as seen by the divine Knowledge. To use one of those wonderful formulas of the Upanishad² which contain a world of knowledge in a few revealing words, it is the Self-existent who as the seer and thinker becoming everywhere has arranged in Himself all things rightly from years eternal according to the truth of that which they are.

Consequently, the triple world that we live in, the world of Mind-Life-Body, is triple only in its actual accomplished evolution. Life involved in Matter has emerged in the form of thinking and mentally conscious life. But with Mind, involved in it and therefore in Life and Matter, is the Supermind, which is the origin and ruler of the other three, and this also must emerge. We seek for an intelligence at the root of the world, because intelligence is the highest principle of which we are aware and that which seems to us to govern and explain all our own action and creation and, therefore, if there is a Consciousness at all in the universe, we presume that it must be an Intelligence, a mental Consciousness. But intelligence only perceives, reflects and uses within the measure of its capacity the work of a Truth of being superior to itself; the power behind that works must therefore be another and superior form of Consciousness proper to that Truth. We have, accordingly, to mend our conception and affirm that not a subconscious Mind or Intelligence, but an involved Supermind, which puts Mind in front of it as the immediately active special form of its knowledge-will subconscious in Force and uses material Force or Will subconscious in substance of being as its executive Nature or Prakriti, has created this material universe.

² *Kavir maniṣī paribhūḥ svayambhūr yāthātathyato'rthān vyadadhāt śāśvatibhyah samābhyaḥ*. — *Isha Upanishad*, Verse 8.

But we see that here Mind is manifested in a specialisation of Force to which we give the name of Life. What then is Life? and what relation has it to Supermind, to this supreme trinity of Sachchidananda active in creation by means of the Real-Idea or Truth-consciousness? From what principle in the Trinity does it take its birth? or by what necessity, divine or undivine, of the Truth or the illusion, does it come into being? Life is an evil, rings down the centuries the ancient cry, a delusion, a delirium, an insanity from which we have to flee into the repose of eternal being. Is it so? and why then is it so? Why has the Eternal wantonly inflicted this evil, brought this delirium or insanity upon Himself or else upon the creatures brought into being by His terrible all-deluding Maya? Or is it rather some divine principle that thus expresses itself, some power of the Delight of eternal being that had to express and has thus thrown itself into Time and Space in this constant outburst of the million and million forms of life which people the countless worlds of the universe?

When we study this Life as it manifests itself upon earth with Matter as its basis, we observe that essentially it is a form of the one cosmic Energy, a dynamic movement or current of it positive and negative, a constant act or play of the Force which builds up forms, energises them by a continual stream of stimulation and maintains them by an unceasing process of disintegration and renewal of their substance. This would tend to show that the natural opposition we make between death and life is an error of our mentality, one of those false oppositions — false to inner truth though valid in surface practical experience — which, deceived by appearances, it is constantly bringing into the universal unity. Death has no reality except as a process of life. Disintegration of substance and renewal of substance, maintenance of form and change of form are the constant process of life; death is merely a rapid disintegration subservient to life's necessity of change and variation of formal experience. Even in the death of the body there is no cessation of Life, only the material of one form of life is broken up to serve as material for other forms of life. Similarly we may be sure, in the uniform law of Nature, that if there is in the bodily form a mental or psychic

energy, that also is not destroyed but only breaks out from one form to assume others by some process of metempsychosis or new ensouling of body. All renews itself, nothing perishes.

It could be affirmed as a consequence that there is one all-pervading Life or dynamic energy — the material aspect being only its outermost movement — that creates all these forms of the physical universe, Life imperishable and eternal which, even if the whole figure of the universe were quite abolished, would itself still go on existing and be capable of producing a new universe in its place, must indeed, unless it be held back in a state of rest by some higher Power or hold itself back, inevitably go on creating. In that case Life is nothing else than the Force that builds and maintains and destroys forms in the world; it is Life that manifests itself in the form of the earth as much as in the plant that grows upon the earth and the animals that support their existence by devouring the life-force of the plant or of each other. All existence here is a universal Life that takes form of Matter. It might for that purpose hide life-process in physical process before it emerges as submental sensitivity and mentalised vitality, but still it would be throughout the same creative Life-principle.

It will be said, however, that this is not what we mean by life; we mean a particular result of universal force with which we are familiar and which manifests itself only in the animal and the plant, but not in the metal, the stone, the gas, operates in the animal cell but not in the pure physical atom. We must, therefore, in order to be sure of our ground, examine in what precisely consists this particular result of the play of Force which we call life and how it differs from that other result of the play of Force in inanimate things which, we say, is not life. We see at once that there are here on earth three realms of the play of Force, the animal kingdom of the old classification to which we belong, the vegetable, and lastly the mere material void, as we pretend, of life. How does life in ourselves differ from the life of the plant, and the life of the plant from the not-life, say, of the metal, the mineral kingdom of the old phraseology, or that new chemical kingdom which Science has discovered?

Ordinarily, when we speak of life, we have meant animal life, that which moves, breathes, eats, feels, desires, and, if we speak of the life of plants, it has been almost as a metaphor rather than a reality, for plant life was regarded as a purely material process rather than a biological phenomenon. Especially we have associated life with breathing; the breath is life, it was said in every language, and the formula is true if we change our conception of what we mean by the Breath of Life. But it is evident that spontaneous motion or locomotion, breathing, eating are only processes of life and not life itself; they are means for the generation or release of that constantly stimulating energy which is our vitality and for that process of disintegration and renewal by which it supports our substantial existence; but these processes of our vitality can be maintained in other ways than by our respiration and our means of sustenance. It is a proved fact that even human life can remain in the body and can remain in full consciousness when breathing and the beating of the heart and other conditions formerly deemed essential to it have been temporarily suspended. And new evidence of phenomena has been brought forward to establish that the plant, to which we can still deny any conscious reaction, has at least a physical life identical with our own and even organised essentially like our own though different in its apparent organisation. If that is proved true, we still have to make a clean sweep of our old facile and false conceptions and get beyond symptoms and externalities to the root of the matter.

In some recent discoveries³ which, if their conclusions are

³ These considerations drawn from recent scientific researches are brought in here as illustrative, not probative of the nature and process of Life in Matter as they are developed here. Science and metaphysics (whether founded on pure intellectual speculation or, as in India, ultimately on a spiritual vision of things and spiritual experience) have each its own province and method of inquiry. Science cannot dictate its conclusions to metaphysics any more than metaphysics can impose its conclusions on Science. Still if we accept the reasonable belief that Being and Nature in all their states have a system of correspondences expressive of a common Truth underlying them, it is permissible to suppose that truths of the physical universe can throw some light on the nature as well as the process of the Force that is active in the universe—not a complete light, for physical Science is necessarily incomplete in the range of its inquiry and has no clue to the occult movements of the Force.

accepted, must throw an intense light on the problem of Life in Matter, a great Indian physicist has pointed attention to the response to stimulus as an infallible sign of the existence of life. It is especially the phenomenon of plant-life that has been illumined by his data and illustrated in all its subtle functionings; but we must not forget that in the essential point the same proof of vitality, the response to stimulus, the positive state of life and its negative state which we call death, have been affirmed by him in metals as in the plant. Not indeed with the same abundance, not indeed so as to show an essentially identical organisation of life; but it is possible that, could instruments of the right nature and sufficient delicacy be invented, more points of similarity between the metal and plant life could be discovered; and even if it prove not to be so, this might mean that the same or any life organisation is absent, but the beginnings of vitality could still be there. But if life, however rudimentary in its symptoms, exists in the metal, it must be admitted as present, involved perhaps or elementary and elemental in the earth or other material existences akin to the metal. If we can pursue our inquiries farther, not obliged to stop short where our immediate means of investigation fail us, we may be sure from our unvarying experience of Nature that investigations thus pursued will in the end prove to us that there is no break, no rigid line of demarcation between the earth and the metal formed in it or between the metal and the plant and, pursuing the synthesis farther, that there is none either between the elements and atoms that constitute the earth or metal and the metal or earth that they constitute. Each step of this graded existence prepares the next, holds in itself what appears in that which follows it. Life is everywhere, secret or manifest, organised or elemental, involved or evolved, but universal, all-pervading, imperishable; only its forms and organisings differ.

We must remember that the physical response to stimulus is only an outward sign of life, even as are breathing and locomotion in ourselves. An exceptional stimulus is applied by the experimenter and vivid responses are given which we can at once recognise as indices of vitality in the object of the experiment.

But during its whole existence the plant is responding constantly to a constant mass of stimulation from its environment; that is to say, there is a constantly maintained force in it which is capable of responding to the application of force from its surroundings. It is said that the idea of a vital force in the plant or other living organism has been destroyed by these experiments. But when we say that a stimulus has been applied to the plant, we mean that an energised force, a force in dynamic movement has been directed on that object, and when we say that a response is given, we mean that an energised force capable of dynamic movement and of sensitive vibration answers to the shock. There is a vibrant reception and reply, as well as a will to grow and be, indicative of a submental, a vital-physical organisation of consciousness-force hidden in the form of being. The fact would seem to be, then, that as there is a constant dynamic energy in movement in the universe which takes various material forms more or less subtle or gross, so in each physical body or object, plant or animal or metal, there is stored and active the same constant dynamic force; a certain interchange of these two gives us the phenomena which we associate with the idea of life. It is this action that we recognise as the action of Life-Energy and that which so energises itself is the Life-Force. Mind-Energy, Life-Energy, material Energy are different dynamisms of one World-Force.

Even when a form appears to us to be dead, this force still exists in it in potentiality although its familiar operations of vitality are suspended and about to be permanently ended. Within certain limits that which is dead can be revived; the habitual operations, the response, the circulation of active energy can be restored; and this proves that what we call life was still there in the body, latent, that is to say, not active in its usual habits, its habits of ordinary physical functioning, its habits of nervous play and response, its habits in the animal of conscious mental response. It is difficult to suppose that there is a distinct entity called life which has gone entirely out of the body and gets into it again when it feels — how, since there is nothing to connect it with the body? — that somebody is stimulating the form. In certain cases, such as catalepsy, we see that the outward physical

signs and operations of life are suspended, but the mentality is there self-possessed and conscious although unable to compel the usual physical responses. Certainly, it is not the fact that the man is physically dead but mentally alive or that life has gone out of the body while mind still inhabits it, but only that the ordinary physical functioning is suspended, while the mental is still active.

So also, in certain forms of trance, both the physical functionings and the outward mental are suspended, but afterwards resume their operation, in some cases by external stimulation, but more normally by a spontaneous return to activity from within. What has really happened is that the surface mind-force has been withdrawn into subconscious mind and the surface life-force into subactive life and either the whole man has lapsed into the subconscious existence or else he has withdrawn his outer life into the subconscious while his inner being has been lifted into the superconscious. But the main point for us at present is that the Force, whatever it be, that maintains dynamic energy of life in the body, has indeed suspended its outer operations, but still informs the organised substance. A point comes, however, at which it is no longer possible to restore the suspended activities; and this occurs when either such a lesion has been inflicted on the body as makes it useless or incapable of the habitual functionings or, in the absence of such lesion, when the process of disintegration has begun, that is to say, when the Force that should renew the life-action becomes entirely inert to the pressure of the environing forces with whose mass of stimulation it was wont to keep up a constant interchange. Even then there is Life in the body, but a Life that is busy only with the process of disintegrating the formed substance so that it may escape in its elements and constitute with them new forms. The Will in the universal force that held the form together, now withdraws from constitution and supports instead a process of dispersion. Not till then is there the real death of the body.

Life then is the dynamic play of a universal Force, a Force in which mental consciousness and nervous vitality are in some form or at least in their principle always inherent and therefore they appear and organise themselves in our world in the forms

of Matter. The life-play of this Force manifests itself as an interchange of stimulation and response to stimulation between the different forms it has built up and in which it keeps up its constant dynamic pulsation; each form is constantly taking into itself and giving out again the breath and energy of the common Force; each form feeds upon that and nourishes itself with it by various means, whether indirectly by taking in other forms in which the energy is stored or directly by absorbing the dynamic discharges it receives from outside. All this is the play of Life; but it is chiefly recognisable to us where the organisation of it is sufficient for us to perceive its more outward and complex movements and especially where it partakes of the nervous type of vital energy which belongs to our own organisation. It is for this reason that we are ready enough to admit life in the plant because obvious phenomena of life are there,—and this becomes still easier if it can be shown that it manifests symptoms of nervosity and has a vital system not very different from our own,—but are unwilling to recognise it in the metal and the earth and the chemical atom where these phenomenal developments can with difficulty be detected or do not apparently at all exist.

Is there any justification for elevating this distinction into an essential difference? What, for instance, is the difference between life in ourselves and life in the plant? We see that they differ, first, in our possession of the power of locomotion which has evidently nothing to do with the essence of vitality, and, secondly, in our possession of conscious sensation which is, so far as we know, not yet evolved in the plant. Our nervous responses are largely, though by no means always or in their entirety, attended with the mental response of conscious sensation; they have a value to the mind as well as to the nerve system and the body agitated by the nervous action. In the plant it would seem that there are symptoms of nervous sensation, including those which would be in us rendered as pleasure and pain, waking and sleep, exhilaration, dullness and fatigue, and the body is inwardly agitated by the nervous action, but there is no sign of the actual presence of mentally conscious sensation. But sensation is sensation whether mentally conscious or vitally sensitive,

and sensation is a form of consciousness. When the sensitive plant shrinks from a contact, it appears that it is nervously affected, that something in it dislikes the contact and tries to draw away from it; there is, in a word, a subconscious sensation in the plant, just as there are, as we have seen, subconscious operations of the same kind in ourselves. In the human system it is quite possible to bring these subconscious perceptions and sensations to the surface long after they have happened and have ceased to affect the nervous system; and an ever-increasing mass of evidence has irrefutably established the existence of a subconscious mentality in us much vaster than the conscious. The mere fact that the plant has no superficially vigilant mind which can be awakened to the valuation of its subconscious sensations, makes no difference to the essential identity of the phenomena. The phenomena being the same, the thing they manifest must be the same, and that thing is a subconscious mind. And it is quite possible that there is a more rudimentary life operation of the subconscious sense-mind in the metal, although in the metal there is no bodily agitation corresponding to the nervous response; but the absence of bodily agitation makes no essential difference to the presence of vitality in the metal any more than the absence of bodily locomotion makes an essential difference to the presence of vitality in the plant.

What happens when the conscious becomes subconscious in the body or the subconscious becomes conscious? The real difference lies in the absorption of the conscious energy in part of its work, its more or less exclusive concentration. In certain forms of concentration, what we call the mentality, that is to say, the Prajna or apprehensive consciousness almost or quite ceases to act consciously, yet the work of the body and the nerves and the sense-mind goes on unnoticed but constant and perfect; it has all become subconscious and only in one activity or chain of activities is the mind luminously active. While I write, the physical act of writing is largely or sometimes entirely done by the subconscious mind; the body makes, unconsciously as we say, certain nervous movements; the mind is awake only to the thought with which it is occupied. The whole man indeed may

sink into the subconscious, yet habitual movements implying the action of mind may continue, as in many phenomena of sleep; or he may rise into the superconscious and yet be active with the subliminal mind in the body, as in certain phenomena of *samādhi* or Yoga trance. It is evident, then, that the difference between plant sensation and our sensation is simply that in the plant the conscious Force manifesting itself in the universe has not yet fully emerged from the sleep of Matter, from the absorption which entirely divides the worker Force from its source of work in the superconscious knowledge, and therefore does subconsciously what it will do consciously when it emerges in man from its absorption and begins to wake, though still indirectly, to its knowledge-self. It does exactly the same things, but in a different way and with a different value in terms of consciousness.

It is becoming possible now to conceive that in the very atom there is something that becomes in us a will and a desire, there is an attraction and repulsion which, though phenomenally other, are essentially the same thing as liking and disliking in ourselves, but are, as we say, inconscient or subconscious. This essence of will and desire are evident everywhere in Nature and, though this is not yet sufficiently envisaged, they are associated with and indeed the expression of a subconscious or, if you will, inconscient or quite involved sense and intelligence which are equally pervasive. Present in every atom of Matter all this is necessarily present in every thing which is formed by the aggregation of those atoms; and they are present in the atom because they are present in the Force which builds up and constitutes the atom. That Force is fundamentally the Chit-Tapas or Chit-Shakti of the Vedanta, consciousness-force, inherent conscious force of conscious-being, which manifests itself as nervous energy full of submental sensation in the plant, as desire-sense and desire-will in the primary animal forms, as self-conscious sense and force in the developing animal, as mental will and knowledge topping all the rest in man. Life is a scale of the universal Energy in which the transition from inconscience to consciousness is managed; it is an intermediary power of it latent or submerged in Matter, delivered by its own force into submental being, delivered finally

by the emergence of Mind into the full possibility of its dynamis.

Apart from all other considerations, this conclusion imposes itself as a logical necessity if we observe even the surface process of the emergence in the light of the evolutionary theme. It is self-evident that Life in the plant, even if otherwise organised than in the animal, is yet the same power, marked by birth and growth and death, propagation by the seed, death by decay or malady or violence, maintenance by indrawing of nourishing elements from without, dependence on light and heat, productiveness and sterility, even states of sleep and waking, energy and depression of life-dynamism, passage from infancy to maturity and age; the plant contains, moreover, the essences of the force of life and is therefore the natural food of animal existences. If it is conceded that it has a nervous system and reactions to stimuli, a beginning or undercurrent of submental or purely vital sensations, the identity becomes closer; but still it remains evidently a stage of life evolution intermediate between animal existence and "inanimate" Matter. This is precisely what must be expected if Life is a force evolving out of Matter and culminating in Mind, and, if it is that, then we are bound to suppose that it is already there in Matter itself submerged or latent in the material subconsciousness or inconscience. For from where else can it emerge? Evolution of Life in matter supposes a previous involution of it there, unless we suppose it to be a new creation magically and unaccountably introduced into Nature. If it is that, it must either be a creation out of nothing or a result of material operations which is not accounted for by anything in the operations themselves or by any element in them which is of a kindred nature; or, conceivably, it may be a descent from above, from some supraphysical plane above the material universe. The two first suppositions can be dismissed as arbitrary conceptions; the last explanation is possible and it is quite conceivable and in the occult view of things true that a pressure from some plane of Life above the material universe has assisted the emergence of life here. But this does not exclude the origin of life from Matter itself as a primary and necessary movement; for the existence of a Life-world or Life-plane above the material does not of itself

lead to the emergence of Life in matter unless that Life-plane exists as a formative stage in a descent of Being through several grades or powers of itself into the Inconscience with the result of an involution of itself with all these powers in Matter for a later evolution and emergence. Whether signs of this submerged life are discoverable, unorganised yet or rudimentary, in material things or there are no such signs, because this involved Life is in a full sleep, is not a question of capital importance. The material Energy that aggregates, forms and disaggregates⁴ is the same Power in another grade of itself as that Life-Energy which expresses itself in birth, growth and death, just as by its doing of the works of Intelligence in a somnambulist subconsciousness it betrays itself as the same Power that in yet another grade attains the status of Mind; its very character shows that it contains in itself, though not yet in their characteristic organisation or process, the yet undelivered powers of Mind and Life.

Life then reveals itself as essentially the same everywhere from the atom to man, the atom containing the subconscious stuff and movement of being which are released into consciousness in the animal, with plant life as a midway stage in the evolution. Life is really a universal operation of Conscious-Force acting subconsciously on and in Matter; it is the operation that creates, maintains, destroys and re-creates forms or bodies and attempts by play of nerve-force, that is to say, by currents of interchange of stimulating energy to awake conscious sensation in those bodies. In this operation there are three stages; the lowest is that in which the vibration is still in the sleep of Matter, entirely subconscious so as to seem wholly mechanical; the middle stage is that in which it becomes capable of a response still submental but on the verge of what we know as consciousness;

⁴ Birth, growth and death of life are in their outward aspect the same process of aggregation, formation and disaggregation, though more than that in their inner process and significance. Even the ensoulment of the body by the psychic being follows, if the occult view of these things is correct, a similar outward process, for the soul as nucleus draws to itself for birth and aggregates the elements of its mental, vital and physical sheaths and their contents, increases these formations in life, and in its departing drops and disaggregates again these aggregates, drawing back into itself its inner powers, till in rebirth it repeats the original process.

the highest is that in which life develops conscious mentality in the form of a mentally perceptible sensation which in this transition becomes the basis for the development of sense-mind and intelligence. It is in the middle stage that we catch the idea of Life as distinguished from Matter and Mind, but in reality it is the same in all the stages and always a middle term between Mind and Matter, constituent of the latter and instinct with the former. It is an operation of Conscious-Force which is neither the mere formation of substance nor the operation of mind with substance and form as its object of apprehension; it is rather an energising of conscious being which is a cause and support of the formation of substance and an intermediate source and support of conscious mental apprehension. Life, as this intermediate energising of conscious being, liberates into sensitive action and reaction a form of the creative force of existence which was working subconsciously or inconsciously, absorbed in its own substance; it supports and liberates into action the apprehensive consciousness of existence called mind and gives it a dynamic instrumentation so that it can work not only on its own forms but on forms of life and matter; it connects, too, and supports, as a middle term between them, the mutual commerce of the two, mind and matter. This means of commerce Life provides in the continual currents of her pulsating nerve-energy which carry force of the form as a sensation to modify Mind and bring back force of Mind as will to modify Matter. It is therefore this nerve-energy which we usually mean when we talk of Life; it is the Prana or Life-force of the Indian system. But nerve-energy is only the form it takes in the animal being; the same Pranic energy is present in all forms down to the atom, since everywhere it is the same in essence and everywhere it is the same operation of Conscious-Force,—Force supporting and modifying the substantial existence of its own forms, Force with sense and mind secretly active but at first involved in the form and preparing to emerge, then finally emerging from their involution. This is the whole significance of the omnipresent Life that has manifested and inhabits the material universe.

Chapter XX

Death, Desire and Incapacity

In the beginning all was covered by Hunger that is Death; that made for itself Mind so that it might attain to possession of self.

*Brihadaranyaka Upanishad.*¹

This is the Power discovered by the mortal that has the multitude of its desires so that it may sustain all things; it takes the taste of all foods and builds a house for the being.

*Rig Veda.*²

IN OUR last chapter we have considered Life from the point of view of the material existence and the appearance and working of the vital principle in Matter and we have reasoned from the data which this evolutionary terrestrial existence offers. But it is evident that wherever it may appear and however it may work, under whatsoever conditions, the general principle must be everywhere the same. Life is universal Force working so as to create, energise, maintain and modify, even to the extent of dissolving and reconstructing, substantial forms with mutual play and interchange of an overtly or secretly conscious energy as its fundamental character. In the material world we inhabit Mind is involved and subconscious in Life, just as Supermind is involved and subconscious in Mind, and this Life instinct with an involved subconscious Mind is again itself involved in Matter. Therefore Matter is here the basis and the apparent beginning; in the language of the Upanishads, Prithivi, the Earth-principle, is our foundation. The material universe starts from the formal atom surcharged with energy, instinct with the unformed stuff of a subconscious desire, will, intelligence. Out of this Matter apparent Life manifests and it delivers out of itself by means of

¹ I. 2. 1. ² V. 7. 6.

the living body the Mind it contains imprisoned within it; Mind also has still to deliver out of itself the Supermind concealed in its workings. But we can conceive a world otherwise constituted in which Mind is not involved at the start but consciously uses its innate energy to create original forms of substance and is not, as here, only subconscious in the beginning. Still though the working of such a world would be quite different from ours, the intermediate vehicle of operation of that energy would always be Life. The thing itself would be the same, even if the process were entirely reversed.

But then it appears immediately that as Mind is only a final operation of Supermind, so Life is only a final operation of the Consciousness-Force of which Real-Idea is the determinative form and creative agent. Consciousness that is Force is the nature of Being and this conscious Being manifested as a creative Knowledge-Will is the Real-Idea or Supermind. The supramental Knowledge-Will is Consciousness-Force rendered operative for the creation of forms of united being in an ordered harmony to which we give the name of world or universe; so also Mind and Life are the same Consciousness-Force, the same Knowledge-Will, but operating for the maintenance of distinctly individual forms in a sort of demarcation, opposition and interchange in which the soul in each form of being works out its own mind and life as if they were separate from the others, though in fact they are never separate but are the play of the one Soul, Mind, Life in different forms of its single reality. In other words, as Mind is the final individualising operation of the all-comprehending and all-apprehending Supermind, the process by which its consciousness works individualised in each form from the standpoint proper to it and with the cosmic relations which proceed from that standpoint, so Life is the final operation by which the Force of Conscious-Being acting through the all-possessing and all-creative Will of the universal Supermind maintains and energises, constitutes and reconstitutes individual forms and acts in them as the basis of all the activities of the soul thus embodied. Life is the energy of the Divine continually generating itself in forms as in a dynamo and not only playing

with the outgoing battery of its shocks on surrounding forms of things but receiving itself the incoming shocks of all life around as they pour in upon and penetrate the form from outside, from the environing universe.

In this view Life appears as a form of energy of consciousness intermediary and appropriate to the action of Mind on Matter; in a sense, it may be said to be an energy aspect of Mind when it creates and relates itself no longer only to ideas, but to motions of force and to forms of substance. But it must immediately be added that just as Mind is not a separate entity, but has all Supermind behind it and it is Supermind that creates with Mind only as its final individualising operation, so Life also is not a separate entity or movement, but has all Conscious-Force behind it in every one of its workings and it is that Conscious-Force alone which exists and acts in created things. Life is only its final operation intermediary between Mind and Body. All that we say of Life must therefore be subject to the qualifications arising from this dependence. We do not really know Life whether in its nature or its process unless and until we are aware and grow conscious of that Conscious-Force working in it of which it is only the external aspect and instrumentation. Then only can we perceive and execute with knowledge, as individual soul-forms and mental and bodily instruments of the Divine, the will of God in Life; then only can Life and Mind proceed in paths and movements of an ever-increasing straightness of the truth in ourselves and things by a constant diminishing of the crooked perversions of the Ignorance. Just as Mind has to unite itself consciously with the Supermind from which it is separated by the action of Avidya, so Life has to become aware of the Conscious-Force which operates in it for ends and with a meaning of which the life in us, because it is absorbed in the mere process of living as our mind is absorbed in the mere process of mentalising life and matter, is unconscious in its darkened action so that it serves them blindly and ignorantly and not, as it must and will in its liberation and fulfilment, luminously or with a self-fulfilling knowledge, power and bliss.

In fact, our Life, because it is subservient to the darkened

and dividing operation of Mind, is itself darkened and divided and undergoes all that subjection to death, limitation, weakness, suffering, ignorant functioning of which the bound and limited creature-Mind is the parent and cause. The original source of the perversion was, we have seen, the self-limitation of the individual soul bound to self-ignorance because it regards itself by an exclusive concentration as a separate self-existent individuality and regards all cosmic action only as it presents itself to its own individual consciousness, knowledge, will, force, enjoyment and limited being instead of seeing itself as a conscious form of the One and embracing all consciousness, all knowledge, all will, all force, all enjoyment and all being as one with its own. The universal life in us, obeying this direction of the soul imprisoned in mind, itself becomes imprisoned in an individual action. It exists and acts as a separate life with a limited insufficient capacity undergoing and not freely embracing the shock and pressure of all the cosmic life around it. Thrown into the constant cosmic interchange of Force in the universe as a poor, limited, individual existence, Life at first helplessly suffers and obeys the giant interplay with only a mechanical reaction upon all that attacks, devours, enjoys, uses, drives it. But as consciousness develops, as the light of its own being emerges from the inert darkness of the involutionary sleep, the individual existence becomes dimly aware of the power in it and seeks first nervously and then mentally to master, use and enjoy the play. This awakening to the Power in it is the gradual awakening to self. For Life is Force and Force is Power and Power is Will and Will is the working of the Master-consciousness. Life in the individual becomes more and more aware in its depths that it too is the Will-Force of Sachchidananda which is master of the universe and it aspires itself to be individually master of its own world. To realise its own power and to master as well as to know its world is therefore the increasing impulse of all individual life; that impulse is an essential feature of the growing self-manifestation of the Divine in cosmic existence.

But though Life is Power and the growth of individual life means the growth of the individual Power, still the mere fact of

its being a divided individualised life and force prevents it from really becoming master of its world. For that would mean to be master of the All-Force, and it is impossible for a divided and individualised consciousness with a divided, individualised and therefore limited power and will to be master of the All-Force; only the All-Will can be that and the individual only, if at all, by becoming again one with the All-Will and therefore with the All-Force. Otherwise, the individual life in the individual form must be always subject to the three badges of its limitation, Death, Desire and Incapacity.

Death is imposed on the individual life both by the conditions of its own existence and by its relations to the All-Force which manifests itself in the universe. For the individual life is a particular play of energy specialised to constitute, maintain, energise and finally to dissolve, when its utility is over, one of myriad forms which all serve, each in its own place, time and scope, the whole play of the universe. The energy of life in the body has to support the attack of the energies external to it in the universe; it has to draw them in and feed upon them and is itself being constantly devoured by them. All Matter according to the Upanishad is food, and this is the formula of the material world that "the eater eating is himself eaten". The life organised in the body is constantly exposed to the possibility of being broken up by the attack of the life external to it or, its devouring capacity being insufficient or not properly served or there being no right balance between the capacity of devouring and the capacity or necessity of providing food for the life outside, it is unable to protect itself and is devoured or is unable to renew itself and therefore wasted away or broken; it has to go through the process of death for a new construction or renewal.

Not only so but, again in the language of the Upanishad, the life-force is the food of the body and the body the food of the life-force; in other words, the life-energy in us both supplies the material by which the form is built up and constantly maintained and renewed and is at the same time constantly using up the substantial form of itself which it thus creates and keeps in existence. If the balance between these two operations

is imperfect or is disturbed or if the ordered play of the different currents of life-force is thrown out of gear, then disease and decay intervene and commence the process of disintegration. And the very struggle for conscious mastery and even the growth of mind make the maintenance of the life more difficult. For there is an increasing demand of the life-energy on the form, a demand which is in excess of the original system of supply and disturbs the original balance of supply and demand, and before a new balance can be established, many disorders are introduced inimical to the harmony and to the length of maintenance of the life; in addition the attempt at mastery creates always a corresponding reaction in the environment which is full of forces that also desire fulfilment and are therefore intolerant of, revolt against and attack the existence which seeks to master them. There too a balance is disturbed, a more intense struggle is generated; however strong the mastering life, unless either it is unlimited or else succeeds in establishing a new harmony with its environment, it cannot always resist and triumph but must one day be overcome and disintegrated.

But, apart from all these necessities, there is the one fundamental necessity of the nature and object of embodied life itself, which is to seek infinite experience on a finite basis; and since the form, the basis by its very organisation limits the possibility of experience, this can only be done by dissolving it and seeking new forms. For the soul, having once limited itself by concentrating on the moment and the field, is driven to seek its infinity again by the principle of succession, by adding moment to moment and thus storing up a Time-experience which it calls its past; in that Time it moves through successive fields, successive experiences or lives, successive accumulations of knowledge, capacity, enjoyment, and all this it holds in subconscious or superconscious memory as its fund of past acquisition in Time. To this process change of form is essential, and for the soul involved in individual body change of form means dissolution of the body in subjection to the law and compulsion of the All-life in the material universe, to its law of supply of the material of form and demand on the material, to its principle of constant

intershock and the struggle of the embodied life to exist in a world of mutual devouring. And this is the law of Death.

This then is the necessity and justification of Death, not as a denial of Life, but as a process of Life; death is necessary because eternal change of form is the sole immortality to which the finite living substance can aspire and eternal change of experience the sole infinity to which the finite mind involved in living body can attain. This change of form cannot be allowed to remain merely a constant renewal of the same form-type such as constitutes our bodily life between birth and death; for unless the form-type is changed and the experiencing mind is thrown into new forms in new circumstances of time, place and environment, the necessary variation of experience which the very nature of existence in Time and Space demands, cannot be effectuated. And it is only the process of Death by dissolution and by the devouring of life by Life, it is only the absence of freedom, the compulsion, the struggle, the pain, the subjection to something that appears to be Not-Self which makes this necessary and salutary change appear terrible and undesirable to our mortal mentality. It is the sense of being devoured, broken up, destroyed or forced away which is the sting of Death and which even the belief in personal survival of death cannot wholly abrogate.

But this process is a necessity of that mutual devouring which we see to be the initial law of Life in Matter. Life, says the Upanishad, is Hunger which is Death, and by this Hunger which is Death, *aśanāyā mr̥tyuh*, the material world has been created. For Life here assumes as its mould material substance, and material substance is Being infinitely divided and seeking infinitely to aggregate itself; between these two impulses of infinite division and infinite aggregation the material existence of the universe is constituted. The attempt of the individual, the living atom, to maintain and aggrandise itself is the whole sense of Desire; a physical, vital, moral, mental increase by a more and more all-embracing experience, a more and more all-embracing possession, absorption, assimilation, enjoyment is the inevitable, fundamental, ineradicable impulse of Existence, once divided and individualised, yet ever secretly conscious of its

all-embracing, all-possessing infinity. The impulse to realise that secret consciousness is the spur of the cosmic Divine, the lust of the embodied Self within every individual creature; and it is inevitable, just, salutary that it should seek to realise it first in the terms of life by an increasing growth and expansion. In the physical world this can only be done by feeding on the environment, by aggrandising oneself through the absorption of others or of what is possessed by others; and this necessity is the universal justification of Hunger in all its forms. Still what devours must also be devoured; for the law of interchange, of action and reaction, of limited capacity and therefore of a final exhaustion and succumbing governs all life in the physical world.

In the conscious mind that which was still only a vital hunger in subconscious life, transforms itself into higher forms; hunger in the vital parts becomes craving of Desire in the mentalised life, straining of Will in the intellectual or thinking life. This movement of desire must and ought to continue until the individual has grown sufficiently so that he can now at last become master of himself and by increasing union with the Infinite possessor of his universe. Desire is the lever by which the divine Life-principle effects its end of self-affirmation in the universe and the attempt to extinguish it in the interests of inertia is a denial of the divine Life-principle, a Will-not-to-be which is necessarily ignorance; for one cannot cease to be individually except by being infinitely. Desire too can only cease rightly by becoming the desire of the infinite and satisfying itself with a supernal fulfilment and an infinite satisfaction in the all-possessing bliss of the Infinite. Meanwhile it has to progress from the type of a mutually devouring hunger to the type of a mutual giving, of an increasingly joyous sacrifice of interchange; — the individual gives himself to other individuals and receives them back in exchange; the lower gives itself to the higher and the higher to the lower so that they may be fulfilled in each other; the human gives itself to the Divine and the Divine to the human; the All in the individual gives itself to the All in the universe and receives its realised universality as a divine recompense. Thus the law of Hunger must give place progressively to the law of Love, the law of Division to the law

of Unity, the law of Death to the law of Immortality. Such is the necessity, such the justification, such the culmination and self-fulfilment of the Desire that is at work in the universe.

As this mask of Death which Life assumes results from the movement of the finite seeking to affirm its immortality, so Desire is the impulse of the Force of Being individualised in Life to affirm progressively in the terms of succession in Time and of self-extension in Space, in the framework of the finite, its infinite Bliss, the Ananda of Sachchidananda. The mask of Desire which that impulse assumes comes directly from the third phenomenon of Life, its law of incapacity. Life is an infinite Force working in the terms of the finite; inevitably, throughout its overt individualised action in the finite its omnipotence must appear and act as a limited capacity and a partial impotence, although behind every act of the individual, however weak, however futile, however stumbling, there must be the whole superconscious and subconscious presence of infinite omnipotent Force; without that presence behind it no least single movement in the cosmos can happen; into its sum of universal action each single act and movement falls by the fiat of the omnipotent omniscience which works as the Supermind inherent in things. But the individualised life-force is to its own consciousness limited and full of incapacity; for it has to work not only against the mass of other environing individualised life-forces, but also subject to control and denial by the infinite Life itself with whose total will and trend its own will and trend may not immediately agree. Therefore limitation of force, phenomenon of incapacity is the third of the three characteristics of individualised and divided Life. On the other hand, the impulse of self-enlargement and all-possession remains and it does not and is not meant to measure or limit itself by the limit of its present force or capacity. Hence from the gulf between the impulse to possess and the force of possession desire arises; for if there were no such discrepancy, if the force could always take possession of its object, always attain securely its end, desire would not come into existence but only a calm and self-possessed Will without craving such as is the Will of the Divine.

If the individualised force were the energy of a mind free from ignorance, no such limitation, no such necessity of desire would intervene. For a mind not separated from supermind, a mind of divine knowledge would know the intention, scope and inevitable result of its every act and would not crave or struggle but put forth an assured force self-limited to the immediate object in view. It would, even in stretching beyond the present, even in undertaking movements not intended to succeed immediately, yet not be subject to desire or limitation. For the failures also of the Divine are acts of its omniscient omnipotence which knows the right time and circumstance for the incipience, the vicissitudes, the immediate and the final results of all its cosmic undertakings. The mind of knowledge, being in unison with the divine Supermind, would participate in this science and this all-determining power. But, as we have seen, individualised life-force here is an energy of individualising and ignorant Mind, Mind that has fallen from the knowledge of its own Supermind. Therefore incapacity is necessary to its relations in Life and inevitable in the nature of things; for the practical omnipotence of an ignorant force even in a limited sphere is unthinkable, since in that sphere such a force would set itself against the working of the divine and omniscient omnipotence and unfix the fixed purpose of things,—an impossible cosmic situation. The struggle of limited forces increasing their capacity by that struggle under the driving impetus of instinctive or conscious desire is therefore the first law of Life. As with desire, so with this strife; it must rise into a mutually helpful trial of strength, a conscious wrestling of brother forces in which the victor and vanquished or rather that which influences by action from above and that which influences by retort of action from below must equally gain and increase. And this again has eventually to become the happy shock of divine interchange, the strenuous clasp of Love replacing the convulsive clasp of strife. Still, strife is the necessary and salutary beginning. Death, Desire and Strife are the trinity of divided living, the triple mask of the divine Life-principle in its first essay of cosmic self-affirmation.

Chapter XXI

The Ascent of Life

Let the path of the Word lead to the godheads, towards the Waters by the working of the Mind. . . .¹ O Flame, thou goest to the ocean of Heaven, towards the gods; thou makest to meet together the godheads of the planes, the waters that are in the realm of light above the sun and the waters that abide below.²

The Lord of Delight conquers the third status; he maintains and governs according to the Soul of universality; like a hawk, a kite he settles on the vessel and uplifts it, a finder of the Light he manifests the fourth status and cleaves to the ocean that is the billowing of those waters.³

Thrice Vishnu paced and set his step uplifted out of the primal dust; three steps he has paced, the Guardian, the Invincible, and from beyond he upholds their laws. Scan the workings of Vishnu and see from whence he has manifested their laws. That is his highest pace which is seen ever by the seers like an eye extended in heaven; that the illumined, the awakened kindle into a blaze, even Vishnu's step supreme. . . .⁴

Rig Veda.

WE HAVE seen that as the divided mortal Mind, parent of limitation and ignorance and the dualities, is only a dark figure of the supermind, of the self-luminous divine Consciousness in its first dealings with the apparent negation of itself from which our cosmos commences, so also Life as it emerges in our material universe, an energy of the dividing

¹ X. 30. 1. ² III. 22. 3. ³ IX. 96. 18, 19. ⁴ I. 22. 17-21.

Mind subconscious, submerged, imprisoned in Matter, Life as the parent of death, hunger and incapacity, is only a dark figure of the divine superconscious Force whose highest terms are immortality, satisfied delight and omnipotence. This relation fixes the nature of that great cosmic processus of which we are a part; it determines the first, the middle and the ultimate terms of our evolution. The first terms of Life are division, a force-driven subconscious will, apparent not as will but as dumb urge of physical energy, and the impotence of an inert subjection to the mechanical forces that govern the interchange between the form and its environment. This in conscience and this blind but potent action of Energy are the type of the material universe as the physical scientist sees it and this his view of things extends and turns into the whole of basic existence; it is the consciousness of Matter and the accomplished type of material living. But there comes a new equipoise, there intervenes a new set of terms which increase in proportion as Life delivers itself out of this form and begins to evolve towards conscious Mind; for the middle terms of Life are death and mutual devouring, hunger and conscious desire, the sense of a limited room and capacity and the struggle to increase, to expand, to conquer and to possess. These three terms are the basis of that status of evolution which the Darwinian theory first made plain to human knowledge. For the phenomenon of death involves in itself a struggle to survive, since death is only the negative term in which Life hides from itself and tempts its own positive being to seek for immortality. The phenomenon of hunger and desire involves a struggle towards a status of satisfaction and security, since desire is only the stimulus by which Life tempts its own positive being to rise out of the negation of unfulfilled hunger towards the full possession of the delight of existence. The phenomenon of limited capacity involves a struggle towards expansion, mastery and possession, the possession of the self and the conquest of the environment, since limitation and defect are only the negation by which Life tempts its own positive being to seek for the perfection of which it is eternally capable. The struggle for life is not only a struggle to survive, it is also a struggle for possession and perfection,

since only by taking hold of the environment whether more or less, whether by self-adaptation to it or by adapting it to oneself either by accepting and conciliating it or by conquering and changing it, can survival be secured, and equally is it true that only a greater and greater perfection can assure a continuous permanence, a lasting survival. It is this truth that Darwinism sought to express in the formula of the survival of the fittest.

But as the scientific mind sought to extend to Life the mechanical principle proper to the existence and concealed mechanical consciousness in Matter, not seeing that a new principle has entered whose very reason of being is to subject to itself the mechanical, so the Darwinian formula was used to extend too largely the aggressive principle of Life, the vital selfishness of the individual, the instinct and process of self-preservation, self-assertion and aggressive living. For these two first states of Life contain in themselves the seeds of a new principle and another state which must increase in proportion as Mind evolves out of matter through the vital formula into its own law. And still more must all things change when as Life evolves upward towards Mind, so Mind evolves upward towards Supermind and Spirit. Precisely because the struggle for survival, the impulse towards permanence is contradicted by the law of death, the individual life is compelled, and used, to secure permanence rather for its species than for itself; but this it cannot do without the co-operation of others; and the principle of co-operation and mutual help, the desire of others, the desire of the wife, the child, the friend and helper, the associated group, the practice of association, of conscious joining and interchange are the seeds out of which flowers the principle of love. Let us grant that at first love may only be an extended selfishness and that this aspect of extended selfishness may persist and dominate, as it does still persist and dominate, in higher stages of the evolution: still as mind evolves and more and more finds itself, it comes by the experience of life and love and mutual help to perceive that the natural individual is a minor term of being and exists by the universal. Once this is discovered, as it is inevitably discovered by man the mental being, his destiny is determined; for

he has reached the point at which Mind can begin to open to the truth that there is something beyond itself; from that moment his evolution, however obscure and slow, towards that superior something, towards Spirit, towards supermind, towards supermanhood is inevitably predetermined.

Therefore Life is predestined by its own nature to a third status, a third set of terms of its self-expression. If we examine this ascent of Life we shall see that the last terms of its actual evolution, the terms of that which we have called its third status, must necessarily be in appearance the very contradiction and opposite but in fact the very fulfilment and transfiguration of its first conditions. Life starts with the extreme divisions and rigid forms of Matter, and of this rigid division the atom, which is the basis of all material form, is the very type. The atom stands apart from all others even in its union with them, rejects death and dissolution under any ordinary force and is the physical type of the separate ego defining its existence against the principle of fusion in Nature. But unity is as strong a principle in Nature as division; it is indeed the master principle of which division is only a subordinate term, and to the principle of unity every divided form must therefore subordinate itself in one fashion or another by mechanical necessity, by compulsion, by assent or inducement. Therefore, if Nature for her own ends, in order principally to have a firm basis for her combinations and a fixed seed of forms, allows the atom ordinarily to resist the process of fusion by dissolution, she compels it to subserve the process of fusion by aggregation; the atom, as it is the first aggregate, is also the first basis of aggregate unities.

When Life reaches its second status, that which we recognise as vitality, the contrary phenomenon takes the lead and the physical basis of the vital ego is obliged to consent to dissolution. Its constituents are broken up so that the elements of one life can be used to enter into the elemental formation of other lives. The extent to which this law reigns in Nature has not yet been fully recognised and indeed cannot be until we have a science of mental life and spiritual existence as sound as our present science of physical life and the existence of Matter. Still we can

see broadly that not only the elements of our physical body, but those of our subtler vital being, our life-energy, our desire-energy, our powers, strivings, passions enter both during our life and after our death into the life-existence of others. An ancient occult knowledge tells us that we have a vital frame as well as a physical and this too is after death dissolved and lends itself to the constitution of other vital bodies; our life energies while we live are continually mixing with the energies of other beings. A similar law governs the mutual relations of our mental life with the mental life of other thinking creatures. There is a constant dissolution and dispersion and a reconstruction effected by the shock of mind upon mind with a constant interchange and fusion of elements. Interchange, intermixture and fusion of being with being, is the very process of life, a law of its existence.

We have then two principles in Life, the necessity or the will of the separate ego to survive in its distinctness and guard its identity and the compulsion imposed upon it by Nature to fuse itself with others. In the physical world she lays much stress on the former impulse; for she needs to create stable separate forms, since it is her first and really her most difficult problem to create and maintain any such thing as a separative survival of individuality and a stable form for it in the incessant flux and motion of Energy and in the unity of the infinite. In the atomic life therefore the individual form persists as the basis and secures by its aggregation with others the more or less prolonged existence of aggregate forms which shall be the basis of vital and mental individualisations. But as soon as Nature has secured a sufficient firmness in this respect for the safe conduct of her ulterior operations, she reverses the process; the individual form perishes and the aggregate life profits by the elements of the form that is thus dissolved. This, however, cannot be the last stage; that can only be reached when the two principles are harmonised, when the individual is able to persist in the consciousness of his individuality and yet fuse himself with others without disturbance of preservative equilibrium and interruption of survival.

The terms of the problem presuppose the full emergence of Mind; for in vitality without conscious mind there can be no

equation, but only a temporary unstable equilibrium ending in the death of the body, the dissolution of the individual and the dispersal of its elements into the universality. The nature of physical Life forbids the idea of an individual form possessing the same inherent power of persistence and therefore of continued individual existence as the atoms of which it is composed. Only a mental being, supported by the psychic nodus within which expresses or begins to express the secret soul, can hope to persist by his power of linking on the past to the future in a stream of continuity which the breaking of the form may break in the physical memory but need not destroy in the mental being itself and which may even by an eventual development bridge over the gap of physical memory created by death and birth of the body. Even as it is, even in the present imperfect development of embodied mind, the mental being is conscious in the mass of a past and a future extending beyond the life of the body; he becomes aware of an individual past, of individual lives that have created his and of which he is a development and modified reproduction and of future individual lives which his is creating out of itself; he is conscious also of an aggregate life past and future through which his own continuity runs as one of its fibres. This which is evident to physical Science in the terms of heredity, becomes otherwise evident to the developing soul behind the mental being in the terms of persistent personality. The mental being expressive of this soul-consciousness is therefore the nodus of the persistent individual and the persistent aggregate life; in him their union and harmony become possible.

Association with love as its secret principle and its emergent summit is the type, the power of this new relation and therefore the governing principle of the development into the third status of life. The conscious preservation of individuality along with the consciously accepted necessity and desire of interchange, self-giving and fusion with other individuals, is necessary for the working of the principle of love; for if either is abolished, the working of love ceases, whatever may take its place. Fulfilment of love by entire self-immolation, even with an illusion of self-annihilation, is indeed an idea and an impulse in the mental

being, but it points to a development beyond this third status of Life. This third status is a condition in which we rise progressively beyond the struggle for life by mutual devouring and the survival of the fittest by that struggle; for there is more and more a survival by mutual help and a self-perfectioning by mutual adaptation, interchange and fusion. Life is a self-affirmation of being, even a development and survival of ego, but of a being that has need of other beings, an ego that seeks to meet and include other egos and to be included in their life. The individuals and the aggregates who develop most the law of association and the law of love, of common help, kindness, affection, comradeship, unity, who harmonise most successfully survival and mutual self-giving, the aggregate increasing the individual and the individual the aggregate, as well as individual increasing individual and aggregate aggregate by mutual interchange, will be the fittest for survival in this tertiary status of the evolution.

This development is significant of the increasing predominance of Mind⁵ which progressively imposes its own law more and more upon the material existence. For Mind by its greater subtlety does not need to devour in order to assimilate, possess and grow; rather the more it gives, the more it receives and grows; and the more it fuses itself into others, the more it fuses others into itself and increases the scope of its being. Physical life exhausts itself by too much giving and ruins itself by too much devouring; but though Mind in proportion as it leans on the law of Matter suffers the same limitation, yet, on the other hand, in proportion as it grows into its own law it tends to overcome this limitation, and in proportion as it overcomes the material limitation giving and receiving become one. For in its upward ascent it grows towards the rule of conscious unity in differentiation which is the divine law of the manifest Sachchidananda.

⁵ What is spoken of here is mind as it acts directly in life, in the vital being, through the heart. Love—the relative principle, not its absolute—is a principle of life, not of mind, but it can possess itself and move towards permanence only when taken up by the mind into its own light. What is called love in the body and the vital parts is mostly a form of hunger without permanence.

The second term of the original status of life is subconscious will which in the secondary status becomes hunger and conscious desire, — hunger and desire, the first seed of conscious mind. The growth into the third status of life by the principle of association, the growth of love, does not abolish the law of desire, but rather transforms and fulfils it. Love is in its nature the desire to give oneself to others and to receive others in exchange; it is a commerce between being and being. Physical life does not desire to give itself, it desires only to receive. It is true that it is compelled to give itself, for the life which only receives and does not give must become barren, wither and perish, — if indeed such life in its entirety is possible at all here or in any world; but it is compelled, not willing, it obeys the subconscious impulse of Nature rather than consciously shares in it. Even when love intervenes, the self-giving at first still preserves to a large extent the mechanical character of the subconscious will in the atom. Love itself at first obeys the law of hunger and enjoys the receiving and the exacting from others rather than the giving and surrendering to others which it admits chiefly as a necessary price for the thing that it desires. But here it has not yet attained to its true nature; its true law is to establish an equal commerce in which the joy of giving is equal to the joy of receiving and tends in the end to become even greater; but that is when it is shooting beyond itself under the pressure of the psychic flame to attain to the fulfilment of utter unity and has therefore to realise that which seemed to it not-self as an even greater and dearer self than its own individuality. In its life-origin, the law of love is the impulse to realise and fulfil oneself in others and by others, to be enriched by enriching, to possess and be possessed because without being possessed one does not possess oneself utterly.

The inert incapacity of atomic existence to possess itself, the subjection of the material individual to the not-self, belongs to the first status of life. The consciousness of limitation and the struggle to possess, to master both self and the not-self is the type of the secondary status. Here, too, the development to the third status brings a transformation of the original terms into a fulfilment and a harmony which repeat the terms while seeming

to contradict them. There comes about through association and through love a recognition of the not-self as a greater self and therefore a consciously accepted submission to its law and need which fulfils the increasing impulse of aggregate life to absorb the individual; and there is a possession again by the individual of the life of others as his own and of all that it has to give him as his own which fulfils the opposite impulse of individual possession. Nor can this relation of mutuality between the individual and the world he lives in be expressed or complete or secure unless the same relation is established between individual and individual and between aggregate and aggregate. All the difficult effort of man towards the harmonisation of self-affirmation and freedom, by which he possesses himself, with association and love, fraternity, comradeship, in which he gives himself to others, his ideals of harmonious equilibrium, justice, mutuality, equality by which he creates a balance of the two opposites, are really an attempt inevitably predetermined in its lines to solve the original problem of Nature, the very problem of Life itself, by the resolution of the conflict between the two opposites which present themselves in the very foundations of Life in Matter. The resolution is attempted by the higher principle of Mind which alone can find the road towards the harmony intended, even though the harmony itself can only be found in a Power still beyond us.

For, if the data with which we have started are correct, the end of the road, the goal itself can only be reached by Mind passing beyond itself into that which is beyond Mind, since of That the Mind is only an inferior term and an instrument first for descent into form and individuality and secondly for reascension into that reality which the form embodies and the individuality represents. Therefore the perfect solution of the problem of Life is not likely to be realised by association, interchange and accommodations of love alone or through the law of the mind and the heart alone. It must come by a fourth status of life in which the eternal unity of the many is realised through the spirit and the conscious foundation of all the operations of life is laid no longer in the divisions of body, nor in the passions and hungers

of the vitality, nor in the groupings and the imperfect harmonies of the mind, nor in a combination of all these, but in the unity and freedom of the Spirit.

Chapter XXII

The Problem of Life

This it is that is called the universal Life.

*Taittiriya Upanishad.*¹

The Lord is seated in the heart of all beings turning all beings
mounted upon a machine by his Maya.

*Gita.*²

He who knows the Truth, the Knowledge, the Infinity that is
Brahman shall enjoy with the all-wise Brahman all objects of
desire.

*Taittiriya Upanishad.*³

LIFE IS, we have seen, the putting forth, under certain cosmic circumstances, of a Conscious-Force which is in its own nature infinite, absolute, untrammelled, inalienably possessed of its own unity and bliss, the Conscious-Force of Sachchidananda. The central circumstance of this cosmic process, in so far as it differs in its appearances from the purity of the infinite Existence and the self-possession of the undivided Energy, is the dividing faculty of the Mind obscured by ignorance. There results from this divided action of an undivided Force the apparition of dualities, oppositions, seeming denials of the nature of Sachchidananda which exist as an abiding reality for the mind, but only as a phenomenon misrepresenting a manifold Reality for the divine cosmic Consciousness concealed behind the veil of mind. Hence the world takes on the appearance of a clash of opposing truths each seeking to fulfil itself, each having the right to fulfilment, and therefore of a mass of problems and mysteries which have to be solved because behind all this confusion there is the hidden Truth and unity pressing for the

¹ II. 3. ² XVIII. 61. ³ II. 1.

solution and by the solution for its own unveiled manifestation in the world.

This solution has to be sought by the mind, but not by the mind alone; it has to be a solution in Life, in act of being as well as in consciousness of being. Consciousness as Force has created the world-movement and its problems; consciousness as Force has to solve the problems it has created and carry the world-movement to the inevitable fulfilment of its secret sense and evolving Truth. But this Life has taken successively three appearances. The first is material,—a submerged consciousness is concealed in its own superficial expressive action and representative forms of force; for the consciousness itself disappears from view in the act and is lost in the form. The second is vital,—an emerging consciousness is half-apparent as power of life and process of the growth, activity and decay of form, it is half-delivered out of its original imprisonment, it has become vibrant in power, as vital craving and satisfaction or repulsion, but at first not at all and then only imperfectly vibrant in light as knowledge of its own self-existence and its environment. The third is mental,—an emerged consciousness reflects fact of life as mental sense and responsive perception and idea while as new idea it tries to become fact of life, modifies the internal and attempts to modify conformably the external existence of the being. Here, in mind, consciousness is delivered out of its imprisonment in the act and form of its own force; but it is not yet master of the act and form because it has emerged as an individual consciousness and is aware therefore only of a fragmentary movement of its own total activities.

The whole crux and difficulty of human life lies here. Man is this mental being, this mental consciousness working as mental force, aware in a way of the universal force and life of which he is part but, because he has not knowledge of its universality or even of the totality of his own being, unable to deal either with life in general or with his own life in a really effective and victorious movement of mastery. He seeks to know Matter in order to be master of the material environment, to know Life in order to be master of the vital existence, to know Mind in
